HENRY FARMAN'S tribulations at New York do not seem to have depressed his spirits or damped his ardour for aviation. Before the members of the financial syndicate who induced him by fallacious promises to go to America took to flight, not on an aeroplane, but in the express train for St. Louis, leaving a lot of debts behind them, Henry Farman had expected to earn a little fortune in the States. But the end of his golden dream has not modified the plans he made during the few short days it lasted. If he has not the money of his American cousins to pay for the new aeroplanes and the further expensive experiments he intends to make, he will, if necessary, dig a big hole in his own modest private means to defray the cost. When, back from America, he was asked on landing at Cherbourg what he intended to do, he replied, "I am going to fly during an hour if Wright does, and even if he does not." That depicts the man. He is quite convinced that a brilliant future is in store for aviation.

MARNEY.

SOME NOTES ON MAGNETOS.

IN view of the increasing popularity of magneto ignition on petrol motor-cars, the query raised in our Correspondence columns this week with regard to the testing of magnetos is of general interest. The current from a magneto machine is an alternating one, and as the magnets lose their strength the current through a fixed resistance will become reduced, owing to the fact that the magnetic field is weakened, which reduces the voltage at a given speed, and therefore reduces the current. The best method of measuring this would be to use an alternating current amperemeter such as Siemen's dynamometer. The plan is more suitable for a testing shop or laboratory, and is as follows:—When the magneto is new, run it at a fixed speed through a fixed resistance according to the relative voltage of the magneto. The machine will then register a definite current on the dynamometer, and as it loses strength in the course of time this amount of current will gradually grow less in proportion. A rough method of judging the strength of the magnets is by noting the amount of attraction they exert upon a steel key or other similar article, but this is of course a very crude method. It should be remembered that permanent magnets do not create any force or power; they only gradually give up the magnetism which is in them, which they impart to a surrounding body such as the armature coils, and as this gradually occurs, the field magnets will undoubtedly grow weaker in a similar manner to a discharging accumulator.

Weakened magnetos can be re-magnetised provided that the proper apparatus is available for the purpose. To remagnetise a steel magnet, it is necessary to saturate it with magnetism, and this can only be done by keeping it in a magnetic field for a suitable period of time. To do this, two bobbins containing windings of wire are necessary, made of sufficient dimensions to enable them to be easily slipped over the two poles of the magnet. A current has then to be passed through the windings, producing a magnetic field in the interior of the bobbins, which will gradually saturate the steel of the magnet and restore it to its original strength. As soon as the current is passing round the circuit, it will be found that the magnets are strongly magnetised, but this is only due to the presence of the magnetic field, and if the bobbins were withdrawn the strength of the magnets would disappear. It is, therefore, necessary to keep them in the magnetic field for a considerable time, varying from, perhaps, thirty to fifty hours, according to the strength of the field, which in turn depends upon the number of windings of wire on the bobbins and the strength of the current passing through the circuit. In arranging the latter, care must be taken to make the direction in which the current is flowing suitable to the poles of the magnet, so that the weakened north and south poles of the magnet are put into magnetic fields which will keep the same polarity on each pole. For various reasons it is better to have the work done by an electrician, to ensure satisfactory results.

"EVERYTHING but the motor" is the business maxim of Messrs. Alfred Dunhill, Ltd., whose price list now extends to 296 pages, being excellently sectionised, thus making it a practical work of reference for the motorist to keep on his bookshelves.

TOWARDS the end of last year we sent an old tyre cover (700 by 85), in which there were several nasty holes and gashes, to the Acme Rubber and Tyre Company, 343, St. Vincent Street, Glasgow, for repair and re-treading. The condition of the cover was so bad that even when we submitted it we had serious doubts as to whether it could be made serviceable, and were therefore not surprised when the Acme Company returned it with a remark that they had done their best with it, but that they did not think it good for more than three months' use. The repaired tyre was fitted to one of the front wheels of a small car, and in actual practice this period has long since passed; indeed, the tyre has been in use for the last six months without trouble of any kind, and bears every appearance of being able to run for a considerable time longer, a tribute to the workmanship of the Acme Company.

CONTINENTAL NOTES.

The 1909 Grand Prix Race.

Although next year's A.C.F. Grand Prix automobile race is still a long way off, the question of a new circuit is already under consideration. The one at present most favoured is that known as the Anjou; it is about 74 kilometres long, and takes in Angers, part of the road to Nantes, Conde, Ingrandes and back to Angers.

Hill Climbing at Trouville.

No less than eighty entries were received for the hill-climbing competition which was held at Trouville, on Wednesday last week, under the auspices of "Les Sports." The contest was held on the Calvary Hill, which has a gradient of 13 per cent. or 1 in 7.7, and the competitors were divided into classes on a cylinder dimension basis. Some excellent performances were put up, particularly by the small vehicles. Thus, in the 100 mm. bore single-cylinder class, Perrot on an Aries won in 1 min. 22.45 sec. The best time of the day, 44 sec., was made by Mr. Rawlinson on a two-seated Darracq in the 91-106 mm. bore four-cylinder class. Miss Dorothy Levitt was the only competitor in the over 110 mm. six-cylinder category, her time being 55 sec.

A Motor Meeting at Spa.

The Automobile Club de Spa is organising a motor meet at Spa for the 14th, 15th and 16th inst. The first day's event is the Course aux Cartons, for which £40 in prizes is being

The above illustration depicts the 12-h.p. Saisre-Naudin Car which Messrs. Jarrott and Letts have just delivered to a client. The vehicle is fitted with a standard body, the addition of a folding Cape hood, glass screen and side doors giving it a very smart appearance.

offered. A large number of cards—each competitor being allotted a different shape—are to be distributed over a 22 kilometre course. The prize will be awarded to the driver who collects the largest number of cards. A hill-climbing contest is to be held on the 15th inst. over a 25-kilometre course, which is so mapped out that the hill between Spa and Malchamps will have to be ascended five times without stopping the engine. A somewhat novel event has been fixed for the last day of the meeting; it is known as the Course aux Sites. Seven photographs will be handed to each competitor, with a rough indication as to the roads in which the views were taken. A prize will be awarded to the competitor who, after discovering the exact spot where the pictures were snapped, is the first to return to the starting point with full particulars of the locality marked on the photo.

Aeronautical News.

A group of members of the French Aero Club has drawn up a project for the foundation of an Aeronautic League for the encouragement of aviation in France. Amongst the leaders are M. Archdeacon and M. Deutsch de la Meurthe. The French military authorities and the Prefect of Police have just issued new regulations with regard to the use of the parade ground at Issy-les-Moulineaux by aviators. Whereas the ground had only been open to experiments between the hours of four and six in the

morning, an order has been issued which permits experiments with aeroplanes at all hours when the ground is not occupied by troops. Early on Wednesday last week M. Bleriot began experiments with his aeroplane at Issy, and, notwithstanding the strong wind, made two successful flights of 200 and 250 metres respectively. In the course of the third flight the machine was caught by an eddy, and, turning a complete somersault, fell to the ground. M. Bleriot was not hurt, but the machine was so damaged that it will be at least a week before the repairs can be completed. M. Lazare Weiller gave a dinner to a few aeronautical enthusiasts at Le Mans, last week, in honour of Mr. Wilbur Wright. There were about thirty guests, including M. d'Estournelles de Constant (the General Commanding the Fourth Army Corps), Mr. Henry Farman, Comte Lambert, M. Henri Kapferer, and M. Léon Bollée. M. Lazare Weiller, in his toast to aviators, said that he hoped that from this meeting at Le Mans great results would follow towards the solution of the problem of flight. M. Delagrangé has received an invitation from the Sociedad Sportiva Argentina to take his aeroplane out to Buenos Ayres with the view of giving demonstrations in the Argentine Republic. It is reported that the French War Office is having two aeroplanes built at the Aerostatic Park at Chalais-Meudon, and that the machines will be ready for trial within a few weeks. They have been designed by officers who have been deputed to make a special study of the different aeroplanes that have been successfully tried at Issy. Wilbur Wright renewed his trials on Monday, when he made a flight which lasted fifty-two

The Fleet of Adler Motor-Cabs in service in Frankfort-am-Main, Germany.

seconds, during which he covered 800 yards. In alighting the aeroplane struck the ground violently and one of the "runners" beneath it was broken. Henry Farman is having a new aeroplane built on a very different model from his previous ones. The chassis will be in the form of an elongated fish, the central frame consisting of four longitudinal wooden bars joined by an aluminium plate in front, where the propeller will be placed. The motor and the pilot's seat will be in the centre. In front of each side of this frame three supporting superimposed planes or wings will spread out, while at the rear two more planes will project in the form of wings. The last of these planes will be movable, and will be used for steering up or down, or maintaining the equilibrium.

Roads in France.

The French Ministry of Public Works has drawn up a plan whereby seven of the fourteen national roads radiating from Paris are to be repaved for a considerable distance at a cost of nearly £160,000. The work is to be completed by the end of next year. Complaints are now being made that tarring the roads, while it is of benefit in allaying the dust nuisance, is having a deleterious effect on trees and plants, and that in a period of four months several fine trees in the Avenue du Bois de Boulogne, Paris, have been destroyed and had to be cut down.

British Motorists in France.

Recent British motoring visitors to France include Mr. and Mrs. J. Conrad, London (35-h.p. Gobron-Brillie); Major Renton (60-h.p. Daimler); Mr. and Mrs. Woodburne, London (30-h.p. Renault); Major Higga, London (35-h.p. Panhard); Mr. and Mrs. Shearer, London (18-h.p. Argyll); Mr. and Mrs. Stephens, London (20-30-h.p. Renault); Mr. and Mrs. Buch, London (60-h.p. Napier); Mr. and Mrs. Kemble, London (50-h.p. Daimler); Mr. John Kelly (28-h.p. Mercedes); Major and Mrs. Waldegrave (24-h.p. Fiat); Mr. and Mrs. Stanley (50-h.p. Maudslay); Sir Edward Duncombe (60-h.p. Daimler); Mr. J. E. Mosenthal (40-h.p. Delaunay-Belleville); Lady Armstrong (40-h.p. Renault); and Mr. Leonard Best, of Brighton (24-h.p. Fiat). Dr. and Mrs. Robert Bruce had a narrow escape in a motor-car accident on Saturday last at Marolles, a village in the Department of the Eure-et-Loire. They were taking a dangerous turning when their automobile collided with another car. The vehicle had one of the rear wheels torn off and was overturned. The occupants of both machines were thrown out, but none of them were seriously hurt.

Belgian Motor-Car Imports and Exports.

Returns just issued show that the value of the foreign motor-cars and parts imported into Belgium during the seven months ending with July last amounted to only £93,944, as compared with £113,020 in the corresponding period of last year. On the other hand, there has been an increase in the exports of Belgian motor-cars and parts—from £260,188 in the first seven months of 1907 to £298,116 in the similar period of the current year.

Encouraging the Home Industry.

The Austrian Minister of the Interior has circularised the authorities of the different provinces of the country requesting them to see that whenever contracts for automobiles for official use are let the specifications call for cars of Austrian construction, and to only give concessions for public motor service lines if the petitioners agree to use native-built cars. This action was taken in consequence of a petition addressed by the Austrian Manufacturers' Association to the Minister, in which the assertion was made that the native industry could only hold its own if given every encouragement.

Miscellaneous Items.

A motor-car run from Reggio di Calabria, in the extreme south of Italy, to Haparanda, on the northern end of the Gulf of Bothnia, Sweden, has recently been completed in 13½ days by Herr F. Beschke, of Magdeburg, Germany, on a Durkopp car.—The P.L.M. Railway Co. has just introduced a special type of truck for the conveyance of motor-cars by fast trains. The trucks are covered and have doors at the ends which permit of easy loading and unloading.—As a result of the several accidents due to motor-cabs that have lately taken place in Munich, the Bavarian Automobile Club has issued a notice to all the owners of such vehicles in the city asking them to issue a warning to their drivers against furious and negligent driving.—The revenue from the taxes on motor-cars in Germany during the fiscal year ending with March last only amounted to £79,340, as against an estimate of £175,000.—La Société des Transports Automobiles Industriels et Commerciaux is the name of a new company which has just been formed in Paris with a capital of £40,000.—A petrol motor fire engine is being acquired by the fire brigade of Karlsruhe, Germany.—So far about twenty entries have been received for the Austrian Automobile Club's annual hill-climbing competition up the Semmering which is to be held on the 20th inst.—A public motor-car service is about to be started between Chateaufort and Saint Remy by the Société des Auto Transports du Midi, of Avignon, France.—The Mont Ventoux hill-climbing competition to be held next week promises to prove a very interesting meeting, as over forty entries have so far been received.—The Coupe des Voiturettes contest, for which thirty-two entries have been received by the "Auto," has been postponed until the 27th inst.

WE hear that Mr. Percy Richardson is at present in the Highlands testing the 1909 model of the Sheffield-Simplex cars.

MESSRS. FEEST AND SON, of Cyrus Street, Goswell Road, London, E.C., are making a speciality of fitting Cape cart hoods, performing the work in three days.

THE local authorities in the Omore, Garw and Llyn Valleys of Wales are petitioning the G.W.R. for a motor service to link up the small villages in that district.

SIR PETER WALKER, BART., of Osmaston Manor, Derby, is amongst the latest purchasers of Daimler cars, he having acquired a 42-h.p. landaulet car of the "Aston" type.

THE London Electrobuses Company are having some of their vehicles fitted with covers on top like the L.C.C. electric tram cars, so as to protect the passengers riding outside in rainy weather.

HERE AND THERE.

MESSRS. JOHN H. FULLER AND COMPANY, LTD., of Minster Street, Reading, are specialising in connection with motor oils and greases.

ATTEMPTS are being made to organise a motor service between an important military station on the plains and a popular hill station in India.

THE magistrate at Greenwich, having a groom from Yorkshire before him the other day for begging, asked "What was the good of a man coming from Yorkshire, a land of horses, to London, a land of motor-cars?"

NEW regulations with regard to motor-cabs have been issued by the authorities at Scotland Yard, authorising the collection of 6d. per head for adults for each passenger over two, in a cab licenced to carry four passengers, in addition to the amount recorded by the taximeter.

A Hill-Climbing Competition at Trouville.—On the Steep Part of the Calvary Hill.

IN the Irish A.C.'s hill-climbing competition, the Otav car entered by Mr. Phibb in Class A and Section 1 was only 5½-h.p.—a fact of special importance when it is remembered that the time taken in the hill-climb was but 8 min. 34 3-5 sec.

MESSRS. GAMAGE have introduced a new clock, in which, instead of the stereotyped cuckoo, a motor-car appears at the hour and half-hour, driven out of one "shed" into another, during which process the tooting of the horn adds realism to the scene.

THE "Wessex of Romance" is a new work by Mr. Wilkinson Sherren published by Mr. Francis Griffiths. To those who are familiar with the Wessex novels of Thomas Hardy this volume of nearly 200 pages will have particular attraction, the Wessex people being dealt with so far as they formed the enviroing influence on the novelist. The work is freely illustrated, and a chapter on the Dorset dialect, together with the Glossary, bear evidence of careful research as well as the interesting style of the author.

FROM the Entertainments Committee of the Portsmouth Corporation comes an ingeniously arranged and well illustrated guide to Southsea and Portsmouth. Its object is to attract visitors, and it can scarcely fail in that design, both photographs and letterpress being of a picturesque kind. Much information of an historical character is well interwoven with that which is required by a modern tourist.

THREE White steam vans are now being used by the public library authorities at Boston, U.S.A., for the delivery and collection of books. The Boston public library is one of the largest in the world, and it has a great many branches where readers are able to obtain books as readily as at the main building. To distribute and collect the volumes is a big task, involving a trip of about sixty miles a day for each of the three vehicles, which do the work of five horses and vans formerly employed. Not only that, but the service is better, for the motor vehicles do every day what was done but three times a week under the former conditions.

A MOTOR-BOAT has been found by the coastguard drifting off Cowes.

THE "Ke-pa-go-in" is the name given to a new motor tyre that has lately been brought out in America.

A NEW edition of the pamphlet on the "Motor Roads of the Future" has just been published by Mr. A. Pimm, 76, Stoke Road, Guildford.

THE Malden police on Saturday took charge of a motor-car which had been abandoned outside an inn. It is a green-bodied car with hood, and is numbered P734 XI. A gentleman's coat and hat were in it.

THE first automobile race in Brazil was held at San Paulo on the 26th ult. The event was held over a hilly course measuring 75 kilometres, the best time of the day being made by a Lorraine-Dietrich car.

FROM Mr. T. Fisher Unwin comes the Ordnance Survey map of Ipswich and the district round about. By means of various colourings the nature of the various roads, together with their altitudes, are indicated in a clear fashion.

MOTOR taxi-cabs have lately been introduced in Buenos Ayres, Argentine Republic, and already La Compagnie Franco-Argentina has 150 Unic four-cylinder cabs at work, and the Compagnie General des Automobiles fifty two-cylinder Renaults.

An Old Stager.

The above illustration depicts the steam wagon built eleven years ago by Leyland Motors, Ltd., for Messrs. Fox Bros., of Wellington, Somerset. The firm had a second machine from the same company a few years ago, and have just ordered a third.

THE Oldham Corporation Fire Brigade has acquired a 40-h.p. Argyll motor tender, a duplicate of one that has now been used for over a year by the Sheffield Fire Brigade. The vehicle is capable of attaining a speed of over thirty miles an hour with a full complement of men.

A FARMER, speaking at a meeting of the Garrioch District Committee at Inverurie on Saturday, advocated a limit of fifteen miles per hour, the graduation of motor-car licences according to the weight of the vehicle, and the substitution of a bell for the present means of acquainting the public of the approach of a car.

WE learn from Montreal that the experience of the Canadian Army Service Corps with automobile transportation at the recent tercentenary celebration in Quebec will probably result in the establishment of a motor volunteer corps. Colonel Biggar, the chief of the Service Corps, is coming to England on special leave to study the system in force in this country.

MESSRS. GEORGE ROUTLEDGE AND SONS, LTD., are now including in the "Oval" series of books on sport a little volume on "Motoring," written by Mr. R. P. Hearne, in which he deals with many mechanical and legal matters that the motorist should know. Several illustrations accompany the text and many useful hints are scattered about its pages.

THE motor postal services in the Commonwealth of Australia are proving a success.

MR. R. M. LAWSON has an excellent garage and repair plant in Dalrymple Street, Girvan.

LA Compagnie de Transports Automobiles de la Vendée has been organised at Pouzanges to establish a public motor-car service in the Vendée district of France.

MESSRS. BROOKS AND WOOLLAN have a well-appointed motor works and garage in the Caversham Road, Reading, near to both the railway station and the river.

MESSRS. THOMPSON'S MOTOR-CAR COMPANY, LTD., of 19 and 20, Brunswick Street, Dublin, have motor-cars for hire, and their establishment is open for the convenience of motorists day and night.

THERE are now over a thousand motor-cars in Bombay. The registration number 1,000 was allotted to a 28-35-h.p. Fiat belonging to Mr. Arthur Hoare, who was the owner and driver of the first motor-car in that city—a 4-h.p. Peugeot.

AT the Rother Ironworks, Cinque Port Street, Rye, Mr. P. S. Jones has a garage with inspection pit and other conveniences for overhauling cars. Accommodation for motors in the town is also provided by the George Hotel, of which Mr. Weale is the proprietor.

THE Midhurst Rural District Council has agreed to co-operate with the West Sussex County Council in getting its haulage work done by light engines and tackle. The idea is to limit the weight of the engine, some of those at present employed being very heavy.

ONE of the most accessible of the garages in Nottingham is that of Mr. Harry Belcher, in Parliament Street. It is near the hotels and has every facility for the visiting motorist, including a waiting room for ladies and excellent facilities for the charging of accumulators as well as the storing of cars. Originally a refrigerating establishment, the premises have now a strictly modern use and are well patronised.

MR. A. R. MILLS has opened a well-arranged garage for a score of cars at 13, Little James Street, John Street, W.C.—off Guilford Street or Theobalds Road. Here he stocks accessories of all kinds and supplies petrol, making a feature, however, of the storage of cars during the day for City men, who come to town on their vehicles. The garage is open night and day. Mr. Mills also teaches driving, giving pupils the advantage of his personal tuition.

AT Brooklands, on Thursday of last week, Mr. Dario Resta, driving Mr. F. R. Fry's Mercedes, broke the 60-h.p. half-mile flying start record by doing the distance in 17.85 seconds. The car, which was fitted with Dunlop detachable rims and tyres, attained a speed of 100.84 miles per hour, three and a half miles per hour faster than the existing record. The weight of the car was over 2,700 lbs.; the bore of the engine was 155 mm. and the R.A.C. rating gave 59.6-h.p.

IT is claimed by Canadians that no country has more charms for motoring tourists than the Province of Ontario, comprising as it does a great variety of interesting scenery, from the peach and vine gardens of Niagara Peninsula, and the tobacco and bean district of Essex, to the magnificent summer outing ground of the Muskoka lakes, the splendid roads around Lake Simcoe and the well-known highways through Eastern Ontario. The roads in some places are not all that could be desired, but in Western Ontario particularly good roads are abundant, and the Niagara Peninsula, from Hamilton to Niagara Falls, has become a motorists' paradise.

IN view of the varying opinions as to the pressure which a pneumatic tyre will bear before bursting, an experiment recently conducted by the testing department of the Pennsylvania Rubber Company is of interest to motorists. A tyre was mounted on an ordinary rim and subjected to a constantly rising pressure until the gauge showed 600 lbs. to the square inch. At this pressure a slight expansion of the tyre was noticed, while at a slightly higher point the bead of the cover was blown out of the rim for about six inches. The walls of the cover were found to be slightly stretched after this severe experiment, but the fabric and rubber were in no place broken.

MOTORING ACCESSORIES.

"Electary" Specialities.

Among those who brought their motoring specialities to the front at the Cordingley Motor Show of 1908 were Messrs. W. and R. Jacobs, 39C, King William Street, London, E.C., whose "Electary" motor requisites gave evidence of sound construction as well as of well thought out designs. Their acetylene lens mirror projector is a lamp well suited for small cars, giving some advantages not always found in devices which are placed upon the market at such a cheap rate as this particular speciality. The front glass is firmly held in an ingenious way, and the adjustable focus is an excellent feature whereby the burner can be brought nearer to or further from the lens, giving different lighting results to suit individual requirements. It is impossible for the door to shake open owing

Fig. 1.

to the design of the lock with which the same is fitted, and a special lock-nut attachment to the bracket secures the strength of that feature of the lamp. A trembler coil in which the platinum points are always in full view and are instantly adjustable is another of their specialities, as well as the "Electary" motor mirrors for cars, portable head lamp, an excellent accumulator and an entirely new type of leather case for use on motor-cycles. This latter is illustrated in Fig. 1. The outside division takes a full length of spare belting, whilst the inner compartment will accommodate a spare inner tube. In this combined case there is no metal work to injure the tube, and it is sold at a price which should make it popular among motor-cyclists generally. We understand that the price of the well-known Electary electric side lamp which was described in our report of the show at the Agricultural Hall has recently been reduced.

The Dunlop Tyre.

The all-rubber grooved non-skidding Dunlop tyre has sold in such enormous numbers since its introduction that quite a goodly number of this type of tyre are received for retreading in the course of a year. Occasionally a cover is accompanied by a letter plaintively deprecating the downward tendency in quality, bemoaning the fact that "this cover has given out after a few thousand miles"—a state of things explained when the receiving clerks discover that the offending cover bears neither name, number, nor trade-mark! There are hundreds of grooved non-skidding covers in use which are simply imitations of the Dunlop tyre, and when—as is frequently the case—one hears that "tyres are not what they used to be," it will generally be found that the buyer has not looked for the familiar name, the number, and the trade-mark—a warning that will be opportune in these autumn days.

"Polkey" Lamps.

We illustrate two of the types of lamps which Messrs. Polkey, of the Hockley Lamp Works, Birmingham, are introducing for service with

Fig. 2.

Fig. 3.

heavy vehicles or automobiles used in trade work. The firm have had more than forty years' experience in the manufacture of railway lamps, and have devoted much attention to the construction of lamps for motor-

vans. These illustrated are strongly made and riveted all through. They are fitted with an anti-vibration spring back, and can be adapted for paraffin or colza, as required. When ordering either of these lamps the name of the vehicle upon which it is to serve should be given, to ensure the correct size of the brackets.

Car-cleaning Specialities.

Those motorists and professional drivers who take an interest in maintaining the smart appearance of their cars will be interested in the two specialities that have lately been put on the market by Messrs. Lane Brothers, of the Electric Polish Works, South Lambeth, S.W. One of these is the Electra liquid metal polish, for which it is claimed, among other advantages, that it quickly produces a mirror-like polish on brass, copper, or other metal parts, and that it does not injure the finger nails of the user, or leave white splashes on anything it touches. It is put up in tins of varying sizes. For the woodwork and upholstery of automobiles the firm are supplying their "Magic" motor-car panel polish. This takes the form of a paste which has been specially prepared for cleaning the highly polished wood panels and patent leather splash wings of car bodies as well as the enamelled parts of motor-cycles &c. It can also be used for reviving patent morocco leather upholstery. The paste, which is supplied in any colour and shade required, in addition to producing a bright, firm polish, also affords a waterproof protection against stains from sticky mud.

The Summers Wind Screen.

In Fig. 4 we illustrate the Summers Wind Screen, which we described in our report of the November Show as possessing many points

Fig. 4.

giving it pre-eminence among such specialities. It can be seen at the Acton Vale Works of Messrs. W. and G. Du'Cros, Ltd.

The "Perfecto" Non-skid.

Among the non-skids which have lately been placed before motorists is the "Perfecto," made by the London Motor Tyre Company, of 9A, Newman Street, Oxford Street, London, W. This tread is composed of compressed rubber with hardened steel rivets, and is made in all sizes. The London Motor Tyre Company have lately issued a price list showing their tariff for tyre repairs, and as their vulcanising plant has been considerably extended, they are now enabled to cope with repairs of all descriptions. They keep a large stock of covers and inner tubes and are well equipped to deal with everything required in connection with motor-car tyres, particularly the repair of the same.

Rugs, &c.

At the Motor House, 314-318 and 366-368, Euston Road, N.W., a large selection of waterproof rugs is now on view, the specialities including the well-known "Defiance" waterproof knee rug in real rubber-lined Melton cloth. Another good addition to the equipment of the car is the V rug, which is designed to give freedom to the feet and legs when actuating the pedals. This is made in the same good quality material as the "Defiance" rug, and has a remarkably smart appearance—considering the low price at which it is offered by the Motor House. A supply of dust coats in white crash and with detachable buttons is another excellent line now being placed before motorists. The Motor House have arranged to send these and other motoring garments and accessories on seven days' approbation on receipt of cash.

Correspondence.

(Letters to the Editor should be addressed to the offices, 27-28, Charing Cross Road, London, W.C.)

THE DUST PROBLEM AND THE INCONSIDERATE DRIVING OF MOTOR VEHICLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—You have been kind enough in the past to publish appeals from the Royal Automobile Club, addressed to those who use motor vehicles, on the subjects of dust-raising, inconsiderate driving, the use of sirens, and kindred matters, and I hope you will be kind enough to give a full publicity to this letter, which I address to all users of motor vehicles, whether they be members of the Club or not. Owing to the great length of time we have been without rain (until the last few days) the dust trouble has become more acute than usual. I therefore appeal to all to exercise special care and to take exceptional pains to reduce to a minimum the inconvenience caused by the raising of dust. That dust exists on our roads in an unnecessary quantity is perhaps a truism, but the scientific trials carried out by the R.A.C. have proved that some cars offend in the raising of this dust to a greater extent than others. The result of the trials, however, broadly speaking, points to the necessity of attacking the problem from the point of view of road construction more than from the point of view of motor-car con-

Among other matters in regard to which the greatest consideration should be given by the driver are the following:—

(a) Overtaking or passing other vehicles, cyclists, or pedestrians at such an immoderate speed as to cause nervousness, unnecessary inconvenience or vexation by dust or mud.

(b) Passing tram-cars or other public service vehicles when passengers are entering or alighting.

(c) Overtaking and passing of another motor vehicle when the latter is proceeding cautiously down hill, or is approaching a corner or proceeding through traffic.

(d) The non-observance of the rule of the road when turning a corner or a bend to the right; for instance, it is unnecessary and dangerous to take right-hand corners as though they were left-hand corners, thereby courting disaster or causing grave inconvenience to others.

It is my intention to lay propositions before the Committee of the Club, when it reassembles in the course of the present month, to the effect that the Club shall devote its almost exclusive attention during the autumn and winter months to the careful study of the dust question, and the causes of and remedies for the complaints made against motors

Some of the Cars at the Leicester Club's Gymkhana.

struction, and therefore, until this problem can be efficiently taken in hand and solved, from the first point of view, I would again enjoin all motor drivers and motor-car owners to consider the conditions of our roads as we find them, and to drive accordingly. Few people, and least of all those whose cars are of the limousine or landaulet type, or whose cars are furnished with a glass screen in front of the driver, can estimate—unless the vehicle be fitted with a reliable speedometer—the speed at which they travel.

I would, as a first effort to diminish the outcry against motors on account of dust, earnestly request all owners to provide their cars with a speedometer, of which there are a number of reliable patterns, as I am confident that this would have the immediate effect of greatly reducing the speed at which some vehicles now—unconsciously, I am convinced—approach corners and travel through villages and towns. The nuisance caused by dust would be much reduced if drivers and occupants of cars would ascertain if their cars are raising dust or not. This can be easily done by looking back occasionally or by the use of mirrors on the car.

A further cause of irritation to the public is undoubtedly the use of the siren, the exhaust whistle and the exhaust cut-out, the use of which is unnecessary and tends only to arouse, not unreasonably, the hostility of the public.

It would be highly regrettable if the motor industry in this country, an industry which has assumed such large proportions, and which gives employment to a great number of people, should suffer through the thoughtlessness of a small percentage of those owning motor vehicles.

and motorists generally, with the object of giving immediate effect to the results of its deliberations and investigations in this direction.

I go further and say that during the year 1909 I hope to make the work I have outlined above the primary work of the Club, on account of its paramount importance. The technical work of the Club should, I consider, occupy a secondary position at this stage, until the dust question has been in some degree settled, and until some effective means has been found for checking inconsiderate driving on the part of those who by their conduct have raised a spirit of opposition to the motor vehicle.

It is well known that the R.A.C. exercises its powers rigidly and impartially over all persons subject to its authority. There are, however, many who are not so subject, and I therefore venture to make this general appeal to all motorists to do everything in their power to secure the safety, the comfort, and the good opinion of the public.—Yours truly,

FRANCIS OF TECK.
Chairman of the R.A.C.

THE TRIALS OF 1909.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I do not think that there is the least necessity for holding another 2,000 miles trial next year. After all, apart from the Brooklands run, the only part of the whole 2,000 miles which formed any sort of a test was that part known as the Scottish trials, and I think that any

car which will run through the Scottish trials would not experience any difficulty in doing well over the comparatively easy other part of the route.

There were forty-six starters in the 2,000 miles trials, thirty-six of which arrived at Brooklands, so that a total of ten fell out. Now of these ten no less than nine fell out during the Scottish trials. I for one do not think it was nearly so hard to win a gold medal in the 2,000 miles trials as to get one in the Scottish. For instance, out of the seven 2,000 miles gold medal winners who also competed in the Scottish trials, only two of them took gold medals in Scotland, and only one of them managed to get a non-stop certificate. The other six lost reliability marks in Scotland as follows:—88, 42, 2, 2, 205, 196. A total of 515 marks for reliability lost in the Scottish trials by the actual gold medal winners in the 2,000 miles!

In my opinion the Scottish trials provide the fullest test of a car that any buyer could possibly want, and I look upon the other part of the 2,000 miles route as just a pleasant way of spending valuable time which the Swift Company, at any rate, could not afford to lose.—Yours truly,

ROBERT BURNS.

BALL-BEARING CRANK SHAFTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As it has recently been mentioned to us by several of our friends that rumours are being circulated that we are experiencing trouble with the ball-bearing crank shaft in the engine of the Sheffield-Simplex cars, we wish to take the opportunity of flatly contradicting this. As we have not experienced a single trouble with the ball-bearings in the engines of our cars, we can only presume that the rumour has originated owing to other makers, who have endeavoured to apply ball-bearings to their engines, having in some cases been unsuccessful and given up the practice.

We know full well that some other makers have given up the use of ball-bearings in their engines, and also, having studied the question very thoroughly, are just as fully aware why they have not been able to apply them successfully. In applying ball-bearings to a motor, it is just as essential, in order to make them successful, to have a knowledge of "how to do it" as it is to surmount all the other problems associated with the designing and building of a successful car. As to the advantages of ball-bearings over plain bearings there can be no two opinions, as in our opinion they are as much an improvement over plain bearings in the engine as ball-bearings have proved themselves to be over plain bearings in the gear-boxes and road wheels of cars.

When the departure was first made from plain to ball bearings in the transmission gear and road wheels of cars, difficulties were experienced, but these have been overcome and made successful, and in the same way we have overcome the difficulties of applying ball bearings to the engine of our car. As regards the advantages of ball bearings in an engine, two of those most prominent are as follows:—(1) Their greater efficiency in comparison with plain bearings, especially when starting under a load; (2) if ball bearings are properly applied, their wear is practically nil in comparison with plain bearings, reducing cost of overhauling and consequently maintenance, besides preventing the engine from getting loose in the bearings, creating the usual rattling associated with a motor that requires overhauling.

In support of these statements we may say that our first demonstrating car has now covered approximately 8,000 miles, and another car, in the hands of our Scotch agents, about 6,000 miles, and in both these cases the engines are running as sweetly and quietly as when first turned out, and neither of them have had a single adjustment or repair made to them. We mention these two cars as, though we have others in the hands of private users, we have no authentic record of the work they have done, but we do know they are giving exceptionally good satisfaction and that we have not received any complaints of the ball bearings in the engines. In conclusion, all we can say is that from the results we have obtained by the use of ball bearings in the Sheffield-Simplex engine, we think it will not be many years before the majority of high-class engines are similarly fitted.—Yours truly,

PERCY RICHARDSON.

THE HORSE NUISANCE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wish to call attention to the nuisance caused on the public highways by the excrement of horses. In the past there were few or no "dustless" roads, and therefore dust was attributed, without any special thought of this excrement, solely to the attrition of the road surface, but now on roads paved with granite setts, asphalt, granolithic, tarred preparations, &c., there is still, in dry weather, dust, and in wet weather, mud, which do not come except to the extent of one or two per cent. from the road-making material, the remainder being, as I have found from frequent analyses, equestrian faeces and urine, which have been macerated by rain and ground by traffic into a more or less fine state, and this material is raised and scattered by every breeze, electric tram, and motor vehicle.

This "dustless road" dust is certainly more painful in the eye than ordinary country road dust, and surely it must be an agent of serious harm to the public health. Thus the "dustless" road draws attention to the horse as detrimental to health, but also it must be remembered that financially he is directly an offender in that he renders more or less unserviceable the money spent in creating such "dustless" roads.

The disgusting habit of spitting by man has been to some extent prohibited, and why should this more disgusting and more harmful habit of the horse be allowed to go unchecked? What would we think of a man who allowed his car to leave several pounds of objectionable matter on our drive, and yet the man with a horse permits this without apology. Personally I have largely cured my cars of this failing, but sometimes, if stopping a considerable time, I place a newspaper on the ground as a safeguard.

It has often occurred to me that the horse, like other domestic animals, might be taught to regulate its habits to proper opportunities, but failing this surely some simple contrivance could be arranged which, attached to the horse or its vehicle, would afford a receptacle for all objectionable matter during the animal's presence on the roads. I find that a medical gentleman, appreciating the evil, has patented an improved dung trap for carriage horses and the like, the specification for which is No. 28710 of 1902. Another medical man once informed me that he thought that in this insidious fashion the horse caused far more deaths than did the motor in accidents. Incidentally the absence of dung and its products from our streets would remove the skidding danger, stop mud-splashing, and reduce the cost of scavenging.—Yours truly,

A. DUCKHAM.

THE USE OF THE SIREN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is claimed by motorists and motor journals generally, that they are full of consideration for the feelings of other users of the highways. How is this exemplified by the use of the siren? Dust, no doubt, is a difficulty; but there can be no difficulty in dispensing with the miserable, irritating, nerve-shaking, blood-curdling howl of the siren, which should never be found on the car of anybody who has the smallest regard for the feelings of others, and which adds an unnecessary terror to the lives of roadside dwellers, and particularly invalids,

The O.T.A.V. Sample and Parcel Carrier lately put on the market by the Junior and Otav Cars Co., Ltd.

The little vehicle is driven by a 5½-h.p. single-cylinder air-cooled engine.

especially at night. Surely the horn or whistle is all-sufficient. Please raise your voice against the most unnecessary nuisance.—Yours truly,

CHARLES LETHBRIDGE.

RE-MAGNETISING A WEAKENED MAGNETO.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be greatly obliged if you or any reader of the *M.C.J.* can kindly tell me if the permanent horseshoe magnets of an ordinary low tension magneto can be successfully re-magnetised, and if so, the method to be adopted. I should also be glad if you could give me some hints as to testing a magneto.—Yours truly,

R. J. S.

[A reply to the query raised by our correspondent will be found elsewhere in the present issue under the heading of "Some Notes on Magnetos."]

A HINT *Re* PLATINUM CONTACTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The usual recommended method of trimming up the contact points of the tremblers of induction coils is that of filing and sand-papering them. I venture to suggest that an improvement on this treatment, with its consequent loss of platinum, is the riveting, as it were, of the points into shape. Immediately the contacts of my coil show signs of pitting I submit them to a very light tapping with a one ounce hammer; thus by a process of riveting I overcome the pitting, and by careful manipulation maintain the original size of the platinum points. This is a very easy matter once the knack has been obtained, and is done as quickly as filing. It is particularly applicable with the screw points, as the platinum can be readily riveted into a flattened, conical shape, which gives most excellent results.—Yours truly,

ELECTRICIAN.

CLUBS AND ASSOCIATIONS.

ROYAL.

SEVERAL important matters will be brought forward for consideration at the meeting of the R. A. C. to take place to-day (Saturday) in the Blackfriars Hall, Norwich. The names of 250 new candidates for individual associateship, whose applications have been received since the last meeting of the committee, will be brought before the above meeting for election. The meeting will be preceded by an official reception of the Club in the hall by the Mayor of Norwich (Mr. E. G. Buxton), and at the conclusion a visit will be made before lunch to the Cathedral.

At the dinner the principal speeches of the evening will be made by H.S.H. Prince Francis of Teck, K.C.V.O., D.S.O., the Hon. A. Stanley, M.V.O., M.P., the High Sheriff (Mr. E. H. Evans-Lombe), the Sheriff of the City (Capt. F. Chamberlin), Col. E. R. A. Kerrison, president of the Norfolk Club, and the Dean of Norwich.

Fine weather alone remains to ensure success for the other principal events—the gymkhana and Sunday's motor-boat trip to Horning. The Norfolk Club has spared no efforts in organising these two items in an ambitious programme.

The Club premises at 119, Piccadilly, W., were re-opened on Monday.

ESSEX MOTOR.

THE 5½-h.p. O.T.A.V. voiturette entered in the Essex Motor Club's twenty-four hours York run has passed through the ordeal with flying colours. Leaving Woodford at 6.7 on Saturday night, it booked in at Cambridge, forty-six miles away, in 2 h. 18 min. Fifteen minutes were spent there for replenishments, &c., and a resumption of the journey was then made to Grantham, sixty-three and three-quarter miles. This

A White Steam Ambulance built for the U.S. Navy Department. The White Company recently delivered two ambulances of the type shown above to the U.S. Navy Department. One of them is for use at the Naval Hospital at New Fort Lyon, Col., and the other at the Naval Hospital at Philadelphia.

control was successfully negotiated non-stop in 3 h. 11 min., despite the delays caused by the darkness and checking. An hour was spent at Grantham for a meal, and the concluding eighty-four miles to York were entered into at 1.50, and should have been accomplished in 4 h. 13 min., but, owing to extreme bad luck with the level crossings between Doncaster and York, this time was exceeded by a few minutes.

The return journey, commenced at 7.28 a.m. from York, was absolutely without incident, and was run through to the twenty-mile schedule, finishing on Sunday night at Woodford at 6.28 p.m. This little car, which complete weighs slightly under 5 cwt., thus ran 388 miles in under 19½ hours on 10½ gallons of petrol, carrying two passengers weighing, with wraps and necessities, 24 st. 9 lb. During the concluding forty-six miles of the run from Cambridge a very heavy thunderstorm was passed through, but this did not in any way affect the belt transmission, and the same pair of V-shaped leather belts were used throughout the journey. Standard Continental tyres were also fitted, the size being 650/55 mm., and these were found to be scarcely scratched on finishing the journey.

LEICESTERSHIRE.

THE members of the Leicestershire Automobile Club gave practical proof of their solicitude for the welfare of the crippled folks of Leicester by holding on the Freeman's Meadow, Leicester, on Saturday afternoon, a gymkhana, the object being to assist the funds generally of the Cripples' Guild. There was a large muster of spectators and eighteen cars were entered for the various events. During the afternoon selections were rendered by the band of the 4th Leicestershire Regiment, and at the

conclusion the prizes were presented by Mrs. E. G. Mawbey, who, on the motion of Mr. Clifford, seconded by Mr. Baker, was heartily thanked for her services. The most successful competitor was Mr. J. A. Doran, who, besides winning several events, carried off a medal presented by the Motor Union for the best performance of the day. A cup was presented by a member of the L.A.C. for the best performance by one of the members, and this trophy Mr. Doran was also successful in securing.

The following were the results of the various events:—

Tilting at Rings.—1, Mr. S. Wright (Humber) (47 1-5 sec.); 2, Mr. J. Doran (18-h.p. Minerva) (52 3-5 sec.).

Ball Race.—1, Mr. S. M. Pearce and lady (10-12-h.p. Humber) (49 3-5 sec.); 2, Mr. E. Allen and lady (18-h.p. Siddeley) (52 2-5 sec.).

V.C. Race.—1 Mr. J. A. Doran; 2, Mr. G. A. Phillips (10-12-h.p. Coventry Humber). Winner's time, 1 min. 43 3-5 sec.

Turk's Head Race.—1, Mr. R. S. Clifford, jun. (12-h.p. Richard-Brasier) (40 4-5 sec.); 2, Mr. E. Allen (41 sec.).

Adam and Eve Race.—1, Mr. G. A. Phillips (41 sec.); 2, Mr. J. A. Doran (44 sec.).

Ladies Lightning Change Race.—1, Mr. J. A. Doran and lady (1 min. 24 1-5 sec.); 2, Mr. H. J. Marsden and lady (20-22-h.p. Darracq) (1 min. 24 2-5 sec.).

Musical Chairs.—1, Mr. S. M. Pearce's lady; 2, Mr. Baker's lady.

The officials were:—Judges: Mr. E. G. Mawbey, Mr. Orson Wright, J.P., and Lieutenant-Colonel Pemberton Peake. Starters: Captain Byron, Mr. J. A. Hartopp, and Mr. R. Sutton Clifford, jun. Time-keeper: Mr. S. C. Winks, A.A.A. and N.C.U. Clerks of course: Dr. Boreham, Messrs. C. R. Robson, W. Watts, J. McAlpin, A. C. Staggs, T. C. King, O. Kaye, and J. Harris. Marshals: Messrs. P. L. Baker, C. Ewart, J. Bennett, and E. W. Tacey. Gate stewards: Messrs. J. Prentice and H. Prentice. Enclosure steward: Mr. R. A. Loseby. Secretary of meeting: Mr. A. McAlpin.

VICTORIA.

DURING the last three months the membership of the Automobile Club of Victoria has increased by 150, the total now standing at 346.

The election of new blood to the committee and the appointment of Mr. E. L. Holmes as secretary have been mainly responsible for the great increase in members, which is being naturally followed by increase in advantages. One of these is the removal to large and commodious rooms at the Equitable Buildings, Melbourne.

Amongst the many fixtures that have been made are:—Official run to the Black's Spur on September 4th, with 150 principal officers of the United States fleet. No less than seventy-two cars have been offered to the committee, and as the run will be about 100 miles through the most beautiful portion of the Victorian scenery, it should prove a delightful experience for the naval visitors. Other events ahead include an opening run, hill climb, and reliability trial.

NORTH-EASTERN A.A.

FROM the North-Eastern Automobile Association comes their 1908 year book, containing a variety of information likely to be of service to members travelling in the counties of Durham and Northumberland. Several interesting pictorial records of recent events in the history of the Association are given, as well as particulars of membership of the R.A.C. and the M.U. and other motoring organisations. A list of hotels at which members are given a discount of 1d. in the shilling on all ordinary bills of garages with a charge of 1s. per night and 2s. for washing the car is also published.

Maps showing the entrances into the towns of Newcastle, Sunderland, Durham, West Hartlepool, Stockton and Darlington are another excellent feature, together with the rules of the following clubs:—Newcastle Motor, South Shields A.C., Sunderland and District A.C., Sunderland and District M.C., Hartlepool and Stockton A.C's. A list of individual members in the two northern counties emphasizes the influence of the association, and the list of identification marks is brought up to date by the inclusion of that for Merthyr Tydvil.

MOTOR CYCLING.

THE annual petrol consumption trial of the Motor Cycling Club will take place on the 12th inst., starting from Gerrard's Cross roads, on the London and Oxford road, at 3 p.m. The course will be five miles in extent, the winner in each class being he who drives furthest on the allowance of Shell motor spirit. Entries close on Monday next, and should be sent to the trials hon. secretary, Mr. F. J. Jenkins, 35, Loveday Road, Ealing, W.

THE small car reliability trial of the Manchester A.C., announced for the 19th inst., will not be held.

THE Closed Hill-climb that was to have been held on Saturday last at Red House Hill, Wantage, was postponed indefinitely.

AN instrument has been installed at Brooklands enabling a permanent record to be obtained, on the Brooklands automatic electric chronograph, of the acceleration of cars from a standing start up to 220 yards for every yard or foot traversed. This acceleration record has been designed by Colonel Holden. Applications for acceleration tests should be addressed to the clerk of the course, Carlton House, Regent Street, S.W.

CASES AGAINST MOTORISTS.

TWO CHARGES FOR ONE OFFENCE.

At the Llanidloes County Sessions, on Thursday of last week, there was a sequel to a motor-car fatality which happened on the Llangurig road, early in July, when Richard Bellamy, of Manchester, was summoned for reckless and negligent driving on July 5th last. Mr. W. E. Rowcliffe, of Manchester, conducted the case for the defence. Deputy Chief Constable Williams prosecuted. In opening the case he stated that the defendant was summoned for reckless and negligent driving. After hearing witnesses Mr. Rowcliffe addressed the Bench, and said that before the decision was given he wished to ask their ruling upon certain points. One was "Does the summons charge the defendant with recklessness or speed?" The Chairman: "Yes, both." The second point asked by Mr. Rowcliffe was "Under the circumstances and in view of the case *Rex v. Wells*, decided before Lord Alverstone in May, 1904, is the defendant entitled to a dismissal of the summons?" The Chairman: Yes, the magistrates sustain your objections.

ALLEGED ROAD RACING.

The Woking county magistrates sat for eight hours on Saturday to hear a case of alleged road racing by motorists at Ripley. Gustave Alson, Burpham Lodge, Guildford, proprietor of the Cobham Motor Works, and John Millett, an employee, were summoned for driving to the common danger and pleaded "Not guilty." They were defended by Mr. Staples Firth. The case against Millett was first gone into. P.-c. Holdaway said he was in his house opposite the Talbot Hotel at 8.5 p.m. on Saturday, July 11th, when he saw two cars standing abreast in the road. The landlord was there, watch in hand, and shouted "Go." Millett went off at a fast pace, but Alson could not start his car. Millett returned about 8.35, and the cars were again brought abreast. The landlord was asked to give Millett thirty seconds start, which he did. Both cars went off at a very fast rate. The village was crowded at the time with people shopping. John Newton, landlord of the Talbot Hotel, said Alson asked him to start the cars in this way as they wished to have a test. He did not understand the test was to take the form of a race. Sergeant Arney said he was sitting writing at the police station at 8.40 when he saw Millett drive past at a speed of between thirty-five and forty miles an hour. As he was leaving the house another car tore by. Evidence being called for the defence, Millett went into the box and said the large car was being tested for reliability and ignition. He drove it on the first occasion and took half an hour to do eight miles. Its behaviour was most unsatisfactory, and that was why Mr. Alson exchanged cars for the second journey. Mr. Firth.—Is there a word of truth in the suggestion that you were racing? The Witness.—I do not think so. The magistrate's clerk.—You must know. The Witness.—Well, we were not racing. Mr. Firth.—What was the reason for one car starting before the other? The Witness.—For the convenience of the public in the village and so as not to get each other's dust. The Justices were unanimously of opinion that the defendant was guilty, and a fine of £10 and costs was imposed. The case against Alson was then heard. The magistrates imposed the same penalty as in the first case. Mr. Firth said he was instructed to appeal in both cases against what his clients considered a gross miscarriage of justice.

HEAVY PENALTY.

At Christchurch on Monday, Percy F. Dawe, of Hampstead, who did not appear, was fined £20 and costs for driving a motor-car at an excessive speed. A second charge against him of driving a car at Christchurch at sixty miles an hour was then heard. The defendant on this charge was fined £50 and 3s. costs, and the magistrates also cancelled his licence and disqualified him for holding another for twelve months.

BRIEF RECORD.

Several cases against motorists have been heard since our last issue as follows:—Richmond (for exceeding ten mile limit in the Park), Aberdeen (3), Epsom (4), Devizes (5), Sheffield (2), Dumfries (3), Feltham (3), Warwick (3), Lichfield, Shrewsbury, Thetford, St. Neots (6), Wokingham, Mortlake (3), Chelmsford, Epsom (3), Colwyn, Aberdeen (5), Kingston (3), St. Ives, Grantham (6), Horsham, Newcastle-on-Tyne (12 cases, 9 convictions, with fines aggregating £29).

THE Daimler Company have added another to their series of picture postcards; this is an illuminated design showing the three Royal Appointments which the company now hold, and is a perfect specimen of colour printing. Copies will be sent to any address upon application to Coventry. Mr. Albert Farnell's Daimler car made fastest time of the day at the Yorkshire Automobile Club (Harrogate Branch) hill-climb on Saturday.

On Saturday last the office and works staff of Messrs. Hans Renold, Ltd., were invited by Mr. and Mrs. Renold to Priestnall Hay to meet their recently married daughter and her husband—Mr. and Mrs. Jackson. Sports were held during the afternoon, after which over 500 sat down for tea, which was served in the new branch works of the company adjoining the sports field.

THE Union Motor Car Company, 21, Denbigh Street, Victoria, S.W., have sent us a copy of the illustrated catalogue they have lately issued of the Troubetzkoy acetylene lamp and generators for which they are British agents. There are a number of special points in the system, among them being a means of interrupting the generation of gas when the light is not required.

INTERNATIONAL ROAD CONGRESS.

MR. BOULNOIS, of the Local Government Board, will be the official representative of the Government at the International Roads Congress to be held in Paris from October 11th to the 18th, in addition to the following from organisations in which motorists are specially interested:—

Roads Improvement Association:—Lord Montagu of Beaulieu, the Hon. Arthur Stanley, the Hon. C. S. Rolls, Colonel R. E. Crompton, and the hon. secretary.

The Motor Union:—Earl Russell, Mr. H. P. Maybury, Mr. W. Ballin Hinde, Mr. A. Moresby White, and the secretary.

POLICE "CONTROLS."

THE half-mile trap at Kingstown, near Carlisle, is in frequent operation.

A MOTOR-TRAP at the Bramham cross-roads, near Tadcaster, has been the cause of three motorists being taken to the local sessions.

POLICE traps are reported as having been in operation during the last few days in the Harrogate road at Alwoodley (Leeds).

OTHERS are reported between Bolney and Newtimber, at Ferring Crossroads, Arundel, and at the London Road, Cheam; High Street, Sutton; Ewell Road, Ewell; Thames Ditton; Hurst Road, East Molesey; Ealing.

BATH ROAD, Devizes, and Easthampstead Road, Binfield, are other danger districts.

THE police are timing motorists along the Fitzjohn Avenue, Hampstead.

The Ariel 40-50-h.p. Car just completed for Mr. D. J. Wernher, of Luton.

The vehicle has a small four-seater touring body painted light grey and upholstered in red. Rudge-Whitworth detachable wheels are fitted, and it will be noticed the spare wheel is mounted on a R.W. dummy hub. The car is equipped with gradometer, speedometer, ordinary horn, electric horn and exhaust whistle, luggage grid at rear, special tool box at side and novel folding glass screen; in fact, Mr. Wernher has had almost everything fitted, the vehicle being quite a record car for completeness of accessories.

COMPANY NEWS.

(In the case of New Companies the file number is given at the end of the particulars.)

RELIANCE TAXI-CAB COMPANY.—£200,000. To carry on the business of motor-cab manufacturers, &c., and to adopt an agreement with the Romer Amalgamation Syndicate, Ltd. The Romer Amalgamation Syndicate, Ltd., and La Societe Generale des Automobiles Porthos may each nominate a director. A. Farkas is first nominee of said Société. 39, Lombard Street, E.C. (99,282).

MCCURDS.—£8,500. To acquire business of W. A. McCurd, motor-car dealer, of 81, Euston Road, and that of W. A. McCurd, Limited, of same address. Private. 81, Euston Road, N.W. (99,319).

BELGRAVIA MOTOR CAR COMPANY, LTD.—Capital £1,000. Objects: To carry on the business of manufacturers and proprietors of motor-cabs, automobiles, carriages, vans, wagons and other vehicles, jobmasters, carriers of passengers and goods, &c. Private company. Registered office, 5-6, Eccleston Place, Belgravia, S.W.

LEEDS MOTOR CABS AND DELIVERY COMPANY, LTD.—£2,000, in £1 shares. 72, Albion Street, Leeds.

THE DAIMLER MOTOREN GESELLSCHAFT, UNTERTURKHEIM, GERMANY.—This company, which manufactures the Mercedes cars, reports a net profit of only £23,871 for the last financial year, as compared with £45,292 in the preceding twelve months.

A NEAT and effective metal sign in black and white now intimates to motorists passing most garages, &c., that the llo lubricants of Messrs. Easton and Melville, Ltd., can be obtained within.

FORTHCOMING EVENTS.

SEPTEMBER.

- 4th and 5th.—Reliability Consumption Trial of the Essex C.A.C. at Norwich in connection with the R.A.C. provincial meet.
- 5th (Sat.).—Aston Hill climb of the Herts C.A.A.
Lancashire A.C. gymkhana.
Invitation of Sir D. Salomons to the Kent A.C. to visit Tunbridge Wells.
Provincial meet of the R.A.C. at Norwich.
Richmond M.C.C. week-end at Henley.
- 12th (Sat.).—Brooklands A.R.C. meet.
- 13th (Sun.).—Mont Ventoux hill climb of the A.C. Vaclusien.
- 14th-26th.—International Rubber and Allied Trades' Exhibition at Olympia, London.
- 17th (Th.).—Touring car competition of the A.C. of Holland through that country.
- 19th (Sat.).—Provincial meet of the Motor Union at Oxford.
North Middlesex A.C. 100 miles reliability run.
Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
Annual Hill Climb of the Bristol and Gloucestershire A.C.
Lunch of the Kent A.C. at Dover.
Herts C.A.C.'s climb for cars at Aston Hill.
- 23rd (W.).—Graphic Trophy and Henry Edmunds Competitions in the Isle of Man.
- 24th (Th.).—The "Four Inch" Race in the Isle of Man.
- 25th (F.).—Welsh A.C. reliability trial for motor-cycles.
- 26th (Sat.).—N.W. London M.C.C. petrol quantity judging competition.
Invitation to the Kent A.C. by Mr. and Mrs. Schlentheim to Chislehurst.
- 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

LIGHTING-UP TIMES—LONDON.

| | | | | | | |
|---------------|----|----------|----|-----------|----|-----------|
| Sep. 5th—7.37 | .. | 7th—7.32 | .. | 9th—7.28 | .. | 11th—7.24 |
| " 6th—7.34 | .. | 8th—7.30 | .. | 10th—7.26 | .. | 12th—7.21 |

To find the approximate lighting-up time in September for Birmingham 9 minutes should be added to the above times, 8 for York, 13 for Manchester, and 25 for Glasgow.

AUTOMOBILE ACCIDENTS.

A FATAL motor-car accident occurred on Saturday near Chester, on the Manchester main road. A boy named Pritchard was riding a tricycle near his home, and on moving from behind a waggon he was knocked down by a motor-car belonging to Mr. Kilvert. The boy was taken by the motorists to Chester Infirmary, where he died soon after admission.

PETER GRANT, of Elgin, met with his death in a remarkable manner on Saturday. He was driving along a country road in his car, when he noticed a hare running in front of him. Jumping hurriedly down into the road, he struck at the animal, but just as he did so a motor-car close behind ran into him, knocking him down, and inflicting such injuries that he died shortly afterwards.

AT the inquest in connection with the Hockley Hill motor-car fatality, recently reported in our columns, the jury returned a verdict of "Accidental death." One of the witnesses, a tramcar driver, who witnessed the accident, said deceased was crossing the road in front of him as the motor-car approached. She rushed towards the pavement. Before reaching it, however, she stopped and turned back, and then made a second attempt to cross the road. The motor-car caught her and knocked her down. Witness thought that if the woman had gone straight on, instead of hesitating, she would have got clear.

A SERIOUS motor-car accident happened at Whithead, County Antrim, on Saturday. The party in the car were starting on a honeymoon tour. The car swerved and ran into a stone wall, the front wheels being smashed to pieces, and the car, rebounding, turned a somersault. The chauffeur was pinned by the upturned car, and sustained serious internal injuries, and a gentleman sitting beside him was hurled through the glass screen, and his face was injured. The bridal party were fortunate enough to escape unhurt.

VISITORS to the Isle of Man, both those engaged in the 4 in. test and others, will be interested to know that "Castle" accumulators, coils, "L.M." plugs, and all goods likely to be wanted in this line, will be obtainable from stock at Mr. W. J. Lewin's motor garage, Athol Street, Douglas.

TO a certain extent Mr. S. T. Robinson, the well-known Dublin motorist has avenged his ill-luck in the recent Irish Trials by coming out on top in the Irish Club Ballinaslaugh Hill Climb. On his 15-h.p. Talbot he not only won in his class, but also carried off the silver cup presented for the best performance on formula in the open section.

WE learn that the Anglo-American Oil Company, Ltd., have been the recipients of a letter from the Admiralty expressing appreciation of the prompt and obliging manner in which they have executed orders for spirit supplied for use in submarines during the recent manœuvres on the east coast.

ROAD REPORTS.

ROTHWELL.—The Rothwell Urban Council has decided to apply to the County Council for the erection of sixteen danger signals at points where there is a great deal of motor traffic.

BRIGHTON.—A Local Government Board inquiry is to be held at Brighton in reference to the application of the Town Council for sanction to borrow over £8,000 for the purpose of laying a tar macadam surface on the road between the aquarium and the western boundary of the borough.

BIRKDALE.—Birkdale Urban Council has adopted a new street signal for motorists. It is triangular in shape, made of transparent red glass, and is exhibited inside the street lamps. The motorist is thus warned of danger by night as well as by day.

BUSINESS NEWS.

SEVERAL important motor-cycling events have lately been won on Pratt's motor spirit, including three events at the Auto Cycle Club's annual meeting and the Coventry Club's hill climb at Newnham. Mr. J. B. Colver's world's hour record at the Stadium was also made on Pratt's spirit.

MESSRS. C. A. VANDERVELL AND CO., of Warple Way, Acton Vale, W., have been appointed sole agents for the "Ruthardt" magneto which was illustrated and described in the *M.C.J.* of April 4th last.

MR. ALFRED HARRIS, of Shoot-up Hill, N.W., who has had an Ariel car for about six months, has written to the Ariel Motor Company, Ltd., stating that he considers the car is as near perfection as to reliability and smoothness of running as one could wish for.

THE United Motor Industries, Ltd., have just issued a circular illustrating and describing a series of small dynamos and motors, the "No-loss" transforming rectifiers and other accessories for use into connection with the charging of ignition accumulators they have lately placed on the market.

THE British Petroleum Company, Ltd., of 22, Fenchurch Street, London, E.C., have now their own store and canning works in Bournemouth.

THE Stepney Wheel Company have now completed arrangements by which they will open works for the manufacture of Stepney spare wheels in Toronto towards the end of the present year, so as to be in good time for the 1909 touring season. Meantime the Stanley Garage, Ltd., of 90-96, Stanley Street, Montreal, hold a large assorted stock of Stepneys.

THE Daimler Motor Company, Ltd., has sent us a photograph of the large new showrooms they have recently opened in London; the premises are situated on the ground floor of the new Piccadilly Hotel, Piccadilly, W., and are in addition to the present ones in Shaftesbury Avenue, W.C., so that it is obvious that the Daimler Company do not intend to lose business through lack of suitable accommodation in the leading thoroughfares.

ACCORDING to the *Daily Chronicle*, pawnbrokers in the vicinity of the metropolitan police courts drive a thriving business with people who need to make up in a hurry the amount of a fine. One pawnbroker has mentioned a case when he took a motor-car in pledge. The car was offered by a lady who was in extremity because the court officers refused to accept a cheque.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, SEPTEMBER 12, 1908.

[No. 497.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

TAKING as the text the declaration of the President of the Local Government Board in the House of Commons on July 29th, the R.A.C. is now preaching a sermon to its members with regard to their conduct on the road. Mr. John Burns said motorists would be well advised "if they realised that public opinion was hardening considerably against the man who owned a motor-car and drove it under conditions and at a speed which were not in

accordance with the neighbourly and kindly amenities that ought to exist among all drivers on the roads. They would be well advised if they recognised how public opinion was moving, and did not provoke the Department to go to the extreme length anti-motorists had advised them to go, which he would be very reluctant to do." The result was seen on Saturday in the adoption by the R.A.C. General Committee of a "Scheme for the establishment of Machinery for dealing with Inconsiderate Driving." The opinion has been formed by the committee that the best method of dealing with the question is by the active co-operation of the motoring organisations; first, with the police who have the enforcement of the law which is framed to deal with offences of this nature; and, secondly, with the public which asks for additional protection. Strong and effective machinery exists on the motorist's side in the R.A.C. and its allied clubs, and it is felt that the desired result will be best attained by the careful operation of the policy of decentralisation in this connection, in order to secure the sympathetic assistance of the police authorities. The provincial clubs should therefore seek to become the recognised motoring authorities in their districts, in order to secure influence with the "powers that be."

Co-operation with the Police.

It is essential for the smooth working of the scheme for every club immediately to establish an Inconsiderate Driving Committee to deal with its own cases. This committee should consist of not more than five members. It should meet frequently, and be vested with executive powers in order that it may take the necessary action in cases brought under its consideration. The local clubs will seek to establish friendly relations with the police, both county and local, within their sphere of operations, in order to enlist their co-operation. The object of co-operation with the police will be to receive through them a report of every case of inconsiderate driving which comes to their knowledge, in order that action may be taken by the club in regard to it. Regular correspondence should be established between the two bodies—the police and the club—and it is necessary that both should collaborate so far as practicable—the former reporting cases, the latter investigating them and advising the police what action has been taken together with the result obtained, the intention being that the provincial clubs should exercise disciplinary jurisdiction over their members.

Repressive Measures.

So far, so good. The repressive measures suggested are also satisfactory, these being as follows:—1. Where, in the opinion of the local club, the circumstances demand it, to suggest prosecution. 2. To expel from membership of his Automobile Club. 3. If a professional driver, or one otherwise entered on the Competitors' Register, to recommend removal of his name for a certain period. 4. If a driver holding R.A.C. certificate or registered for employment, to recommend withdrawal of certificate or removal from register. The suggestion that "the public should be invited by advertisement and other means to report to the local club all cases coming under their notice" is a point upon which some difference of opinion will be expressed. Complaint by a responsible person is not objected to; but there is no reason why the common informer and the tramp on the roadside should be invited to harass and worry other users of the road. Such a policy need not be keenly developed.

Motor-car Imports and Exports.

THERE was again a falling off in the imports of foreign motor-cars and parts into this country during August, but the decline was not so great as the recent reports as to dull business would have led us to expect. Of complete cars 306 were imported during the month, of the value of £112,432. The number of chassis imported was 331, valued at £102,393, while parts were responsible for £175,695, giving a combined total for August of £390,520, as against £398,747 in the corresponding month of last year. The gross imports of cars (3,030 in number), chassis (2,213), and parts during the first eight months of the current year amounted to only £2,988,596, as contrasted with £3,333,435 in the corresponding period a year ago. Turning now to the section relating to the exports of British automobile productions, these again show a slight decrease—from, in the aggregate, £106,734 in August, 1907, to £96,041 last month. Altogether 148 complete cars (£53,885) and 18 chassis (£6,016) were despatched from this country in August, as well as parts to the extent of £36,140. The gross shipments during the eight months ending with August are returned at £773,180, which contrasts with £799,276 in the similar period of last year.

Automobile Instruction.

AT the end of the present month many of the leading polytechnics and technical schools throughout the country will be commencing their courses of instruction in automobile engineering for the coming winter. Only a few have been unable to arrange for the institution of such lessons, and some of these, like the Municipal School of Technology of Manchester, hope to include the subject in the session 1909-10. In London the Polytechnic, of Regent Street, W., will be holding day and evening classes in motor-car work under the direction of Mr. H. J. Spooner, M.I.M.E., the course including workshop instruction and driving lessons. Similarly, at the Battersea Polytechnic there will be special classes for those interested in automobile work, and the prospectus just issued shows how thoroughly this is undertaken under the general direction of Mr. W. Curnick. The Northampton Insti-

tute at Clerkenwell is also arranging a practical series of instructions under Mr. C. E. Larard, so that those in and near London who wish for instruction in both theory and practice have no complaint to make of the facilities provided. In our next issue reference will be made to the syllabuses provided for typical courses of instruction.

Police and Public.

OFTEN have we notified our readers of the finding of motor accessories and other articles by the police on the roadside, several Chief Constables having taken advantage of our Correspondence columns to intimate when their officers have picked up anything which might have fallen from a car. We now understand that the idea has been developed and is being taken up officially between the Chief Constables of Scotland and the Scottish Automobile Club. An arrangement has been made whereby at intervals the police are to be supplied with a list of accessories and furnishing of motor-cars lost on the road, with a view to the recovery of the same by the owners. The system will be worked in a simple way, those members of the club who lose articles from their cars while travelling advising the secretary of the organisation from time to time so that he may make comparisons of the lists of the things lost with those of articles found by the police. The rest will be easy.

Motoring in Mexico—A Halt near Ahuacatlan.

[El Automobil en Mexico.]

Speedometers.

ELSEWHERE we refer to some of the speedometers now available for British motorists, who, incited thereto by the magisterial warnings and presidential suggestions, are giving more serious attention than heretofore to the provision of such instruments. Several sheriffs in Scotland have been giving similar advice to the owners and drivers of cars brought before them, and at Aberdeen the other day it was said that it was unfair to drivers of automobiles that they should be sent out with cars which were not provided with a proper outfit. In assisting readers in that direction the series of notes upon speedometers which commences this week will have real value. We shall be glad to hear from readers who have found their speedometer of service in rebutting police evidence at the courts.

In Manxland.

PRACTICE for the "four-inch" race will be allowed until 8 a.m. on the 22nd, and club inspectors are watching the competitors to prevent careless driving. In addition to the warning flags which will be placed across the road (blue) on the day of the race at the uniform distance of 300 yards from the corner or point where caution is needed, warnings with the name of

the spot in large letters (white on blue) are being placed across the road for the practice as well as for the day of the race. There are ten of these—namely, Willaston Corner, Quarter Bridge, Braddan Bridge, Greeba Corner, Ballacrairie, Ballameanagh, Kirk Michael, Ballaugh Bridge, Sulby Bridge, Ramsey Depot. For Sulby Bridge there are, in addition, two flags, one at 200 and one at 100 yards from the bridge, and the road is tarred for a distance of 100 yards from the bridge. To facilitate passing competitors are advised to furnish their cars with exhaust whistles and to wear caps with ear rolls (such as are now commonly used in motor racing) to enable them to hear an approaching car. Mechanics must keep a frequent look-out behind in order to facilitate passing and to avoid obstruction. All drivers will be examined by a doctor on the day of weighing, and any found unfit to drive will not be allowed to start.

The Motor-car as an Aid to Business.

AN amusing incident in the correspondence which has been appearing in "The Times" has just occurred, in which Sir Martin Conway has scored rather neatly against an anti-motoring correspondent. Sir Martin had written against the attempt to fan into violence the prejudice which may exist in some quarters against motorists, when "R 7339" wrote suggesting that he should visit the nursery gardens of Mr. Bunyard, at Maidstone, near his own house, with a view to obtaining that gentleman's opinion as to the viciousness of the motor. The famous nursery garden is flanked by the main London road for a long distance, and when Sir Martin Conway called as suggested he was informed that no injury or inconvenience was suffered from the dust, notwithstanding the great motor traffic on the highway from London to Paris. Mr. Buss, the manager of the gardens, is apparently no enemy of the motor-car; in fact, he called attention to the utility of the automobile in the development of their business, nine out of ten of the customers going to Maidstone by motor-car coming from Hampshire and the counties north of London. In fact, he says that whereas customers previously sent their gardeners to him by rail, now they go themselves, and the automobile, so far from damaging, has really helped his particular industry.

High Hedges.

APPARENTLY the members of the Horsham Rural District Council are disinclined to agree to the suggestion that the hedges in the locality should be lowered in order to add to the safety of the public. On several occasions during recent years those who direct the automobile policy have urged the clipping of the high hedges that obscure the view on open roads in order to prevent the terrible risks that now occur at many of the sharp turns on the road. But some members of the Horsham Council opine that any reform in that direction would serve to encourage motorists to more speedy travel, and we understand it is probable that they will disagree with the recommendation of their Surveyor, who has given expression to his opinion that, owing to the frequency of motor accidents at these dangerous places, Rural District Councils should be given the power to cut the hedges so low that the view should always be open, and thus the danger of collision reduced to a minimum.

The Dean's Problem.

NOT often do motorists have such a witty speaker at their grave assemblies as the Dean of Norwich. Last Saturday, at the dinner of the R.A.C., he submitted a simple piece of arithmetic. "Let them estimate, if they could, the mileage covered by motorists in England, Scotland, and even in Ireland—he would leave out the Isle of Man, with its four-inch gauge—and contrast with that extent of mileage the number of accidents caused to cocks, hens, and rabbits, as well as to human beings, by motor-cars. He thought they would find that the disparity between the one and the other would cast a flood of ridicule

upon the antipathy that was now being ventilated in the Press against the motor-car. The Press was largely responsible for deepening this antipathy. The Press was a wonderful power—he sometimes felt its influence. But he was case-hardened to that sort of thing. So long as motorists were considerate and careful in driving, they need not care a straw for what was said against them.

Hill Climbs Abandoned.

LAST week we announced that the hill climb which was to have been held on the previous Saturday at Wantage had been postponed indefinitely, and that the Manchester A.C. had decided not to go further with the Small Car Reliability Trial which they had announced for the 19th inst. Shortly after going to press we learned that the hill climb of the Hertfordshire County A.C. had been cancelled owing to the scarcity of entries received. This probably was accounted for by the fact that a very large percentage of the members of that enterprising

RACING IN ITALY.

THE two races which were held on the Bologna circuit, in Italy, on Sunday and Monday last attracted a considerable amount of interest. The event on the first day, which was known as the Florio Cup contest, was for cars of the Grand Prix type having engines of a maximum bore of 155 mm. in the case of four-cylinder motors. The race was over a distance of 528 kilometres (330 miles), equal to ten laps of the 52·8 kilometre circuit, which takes in Borgo-Panigale, Castelfranco, Sant Agata, and San Giovanni in Persiceto. The course comprises some splendid stretches of road, where high speed can be attained; but, on the other hand, there are places so narrow that it is impossible for one car to pass another. Seventeen entries had been received for the contest, the drivers of the vehicles and the order of starting being shown below:—

| Order of Starting. | Car. | Drivers. |
|--------------------|-------------|------------------------|
| 1, 7, 13 | De Dietrich | Duray, Minoia, Trucco. |
| 2, 8 | Motobloc | Faroux, Gauderman. |

The Florio Cup Race.—Nazzaro, the winner, finishing on his Fiat Car.

organisation were still away from home on holidays, but the feeling that has grown against such trials must also be regarded as partly responsible. The social side of these events is of considerable interest and largely justifies the existence of the local organisations; but the speeds attained in hill climbs on ordinary roads have apparently frightened a good many of the members of the public, and alarmed some magistrates into the belief that the man who has a motor-car must necessarily have a taste for abnormal speed. This being so, there is something for the suggestion that has been made recently that the clubs might well abandon for a term anything in the way of competitions in which speed is a determining factor, confining themselves to moderate driving on the road and the practice of patience when reading the correspondence columns of some of our daily contemporaries.

| | | |
|-----------|------------|-----------------------------|
| 3, 9, 14 | Mors | Damogeo, Garret, Landon. |
| 4, 10, 15 | Fiat | Lancia, Nazzaro, Wagner. |
| 5, 11, 16 | Clement-B. | Gabriel, Hautvast, Shepard. |
| 6, 12, 17 | Itala | Cagno, Fournier, Piacenza. |

The start took place at 6 a.m., the competitors being sent off at minute intervals. Minoia made the fastest initial circuit, which proved disastrous to Faroux and Hautvast, the latter overturning at one of the turns. Lancia was the first to complete two rounds, his time for the second one, 23 min. 24 sec., being equal to over eighty-two miles per hour, the fastest of the day. Three of the competitors fell out in this lap, viz., Duray, Gauderman and Piacenza, while Fournier, who overturned at a bad corner, and Wagner disappeared in the fourth circuit. At the half distance Nazzaro ran into first place, a position he never lost, Trucco being second, Lancia third, and Garret fourth. The sixth, seventh, and eighth rounds saw no change in the two leaders, but Cagno was now third with Minoia close behind. Gabriel had now retired, leaving only seven in the field, which

A SERVICE of White steam taxi-cabs has lately been started in Boston, U.S.A.

was reduced in the final lap to six, owing to Minoia giving up. The order at the finish was as follows:—

| Order. | Driver. | Car. | Time. |
|--------|--------------|-----------------------|----------|
| | | | h. m. s. |
| 1. | Nazzaro ... | Fiat ... | 4 25 21 |
| 2. | Trucco ... | Lorraine-Dietrich ... | 4 34 7 |
| 3. | Cagno ... | Itala ... | 4 56 12 |
| 4. | Demogeot ... | Mors ... | 4 57 11 |
| 5. | Lancia ... | Fiat ... | 5 8 51 |
| 6. | Garret ... | Mors ... | 5 22 7 |

Nazzaro, whose average speed works out at 74.8 miles per hour, thus adds another victory to his already long list of successes on Fiat cars. Indeed, the speed is the highest that has been attained in a big road race, Lautenschlager's average in the Grand Prix in July last being only 69 miles per hour. As will be seen, the race was a struggle between France and Italy, victory resting with the latter, for out of six Italian cars which started three finished, as against only a similar number out of eleven French vehicles. Among the latter, the performance of the Mors cars is worthy of note, in view of the fact that the company has for some years not taken part in international speed contests. The course was well guarded, but after the arrival of the winner the spectators invaded the track, to the danger of themselves and the competitors.

The Targa Bologna race, which was held on Monday, was over eight laps of the same course, equal to 422½ kilometres (264 miles), and was open for four-cylinder cars having a bore between a minimum of 120 mm. and a maximum of 130 mm. When the list closed it contained the names of twenty competitors, but only the following sixteen started:—

| Order of Starting. | Car. | Drivers. |
|--------------------|----------------|-----------------------------------|
| 1 | Diatto-Clement | Primavesi. |
| 2, 11 | Franco... | Buzio, Cariolati. |
| 3, 12 | S.P.A.... | Appendino, Picoli. |
| 4, 13, 15 | Bianchi | Tommaselli, Brambilla, Franchini. |
| 5, | Zust | Maggioni. |
| 6, 14, 16 | Junior... | Tamagni, Tangazzi, Manganotti. |
| 7 | De Dietrich | Parran. |
| 8 | Berliet... | Porporato. |
| 9 | Fiat | Vaccari. |
| 10 | Darracq | Ravetto. |

The cars were again sent off at minute intervals from 6 a.m. The struggle at first was between Maggioni on a Zust, Porporato on the Berliet, and one of the Bianchis; at the half distance, however, Porporato held a good lead, with Buzio on a Franco second. Porporato continued to drive in brilliant style, and finally won in a shade over four hours. The result was as follows:—

| Order. | Driver. | Car. | H. | M. | S. |
|--------|-----------|---------|----|----|----|
| 1 | Porporato | Berliet | 4 | 0 | 56 |
| 2 | Appendino | S.P.A. | 4 | 14 | 5 |
| 3 | Buzio | Franco | 4 | 40 | 57 |
| 4 | Tangazzi | Junior | 4 | 43 | 49 |
| 5 | Maggioni | Zust | 5 | 7 | 57 |
| 6 | Picoli | S.P.A. | 5 | 15 | 41 |

The other competitors abandoned the race.

The winning Berliet was equipped with Dunlop tyres, and throughout the race Porporato had occasion to change only one tyre, notwithstanding that his speed averaged just over sixty-five miles an hour.

MR. W. AUGUSTUS FARNHAM, Asso. M. Inst. M. E., the engineer and surveyor of the Foots Cray Urban District Council, has recently designed a small and inexpensive road-tarring machine for use in his district. The machine has no intricate working parts, and is drawn by one man. It is capable of tarring a width of 5 ft. at one stroke, and will do half-a-mile in length of a 24 ft. road in one day at a cost for labour of about £1. The principle is as follows:—A V-shaped trough mounted on two wheels is provided with slots 1-16 in. wide, which allows the tar (which is poured in from buckets), to percolate to the road, and is followed by a rubber squeegee, which spreads it. The quantity of tar on the road is regulated by raising or depressing the handles of the machine, thereby increasing or decreasing the pressure on the squeegee.

SOME CURRENT TOPICS.

Development in Motor Design—a Daimler Departure.

Marked as has been the progress made with the construction of petrol motors in recent years, as the power developed by the "four-inch" motors taking part in the forthcoming race in the Isle of Man fully testifies, it has long been felt by many engineers that the existing type is only passing through a stage of development, and that nothing like finality will be achieved until the enormous heat losses through the water jacket and through the high-pressure exhaust are in some measure prevented; until something more simple than the present ignition system is evolved; and until the mechanism employed to regulate the aspiration and expulsion of the gases—in other words, the valve-operating mechanism—is simplified to the last degree. If reports be true, an important development in the last-named connection is about to take place, as it is announced that the Daimler Company has decided to adopt an entirely new type of engine on some of its next year's cars. The new design, which is the invention of Mr. Knight, an American engineer, who has been experimenting with it for some years past, does away entirely with the ordinary type of inlet and exhaust valves and their necessary cam shafts, tappets, springs, &c., ports in the cylinder walls being opened and closed by means of reciprocating cylinders moving between the piston and the cylinder proper. In other words, the inlet and exhaust ports are controlled by a circular slide valve actuated by an eccentric motion in the base chamber. There are other points of note in the motor, which is stated to be extremely quiet and smooth running when in operation. We understand that before deciding on its adoption the Daimler Company has subjected the engine to exhaustive trials with satisfactory results, so that the public appearance of the new design will be awaited with considerable interest.

A New Medium Power Four-Cylinder Car.

The feature of the past year has been the production by many of the leading continental builders, who had previously confined their attention to high-power vehicles, of four-cylinder cars of medium power and at a price which renders them available to a much larger clientele than was previously possible. This type of vehicle has of course been turned out for some time from a number of factories in this country, and, in view of the tendency of the times, it was perhaps only natural that this example should be followed by foreign makers. As a case in point, I may refer to the N.A.G. Company, of Berlin, who are now building an attractive little 12-14-h.p. model, one of the first examples of which I have had an opportunity of inspecting at the depot of the sole British concessionaires, the Connaught Motor and Carriage Company, Ltd., 28 and 29, Long Acre, W.C. The new car, while following the standard lines of live axle vehicles, has several points of interest. For instance, the engine, which is 75 mm. bore by 85 mm. stroke, has all the four cylinders cast in one piece. High-tension magneto ignition is fitted as standard, while the water circulation is on the thermosiphon system. The clutch is of the leather-faced cone variety, and the three-speed gear-box is adapted to give a direct drive on the top speed. Although put on the market at a relatively low price, every attention has apparently been paid to the details, ball bearings being fitted throughout excepting the engine. The new car is adapted to receive any type of body, and as a five-seated side-entrance phaeton has a very smart appearance. Turning the scale at but approximately 14 cwt., it should be not only speedy and a good hill-climber, but very light on tyres.

ARCANUM.

A CABLE has been received from the Australian motorists, Messrs. Dutton and Aunger, stating that they have picked up the old 20-24-h.p. Talbot car which it will be remembered they had to abandon on their first attempt to cross the continent, owing to the torrential rains encountered. The cable goes on to say that they have found the vehicle in good order, notwithstanding that it had been standing out in the open bush of central Australia for nine months.

THE "FOUR-INCH" RACE.

(BY OUR OWN CORRESPONDENT.)

DOUGLAS, Tuesday.

PRACTISING commenced on Thursday morning under the best possible climatic conditions. Ward, on a S.C.A.T., was first out, followed by the three Darracqs and Reade on a Beeston Humber. Guinness drove one of the Darracqs, and all three cars of that make, along with the Humber and the Calthorpe, did two circuits of the course, but being the first morning it was not given to endeavours to attain a high speed, and drivers were content to attend to the necessary adjustment of their cars. Dunlops have again stationed men at each of the dangerous corners, and this action is much appreciated by the drivers, especially those new to the course. Friday morning was very wet, and more than one driver experienced bad skids on the slippery roads. Moss, on an Arrol-Johnston, was perhaps the worst sufferer, and had a slight mishap at the top of Bray Hill. Ignorant of the bad nature of the turn he skidded and struck the hedge, his car completely overturning. Moss and his mechanic quickly extricated themselves, little the worse for the accident, and with the assistance of some spectators righted the car, drove off and completed a second circuit in creditable time. Robinson, on a Calthorpe, accomplished two rounds of the course, as did also Porter on another car of the same make and Stirling on a Hutton, but it being the latter's first practice he took matters very easily. Robinson had the misfortune to break a crank shaft while coming along the mountains on his second venture, but as the course from this point is all down hill he was able to complete the circuit without the aid of his engines. George, who so sensationally lost his ballast, seats and floor boards while driving an Argyll in the T.T. race of 1906, is driving the third Darracq, and is doing well. A S.C.A.T. car had the bad luck to collide badly with the hedge while negotiating Sulby Bridge, but no injury was done. The drivers complained about the tar which has been placed on the road at this point of the course and gravel has since been laid over it, making skidding less probable. After practising on Friday Mr. Gregory, one of the officials, measured the cylinders of several of the cars, and one was found to be 1,000th part of an inch too large, and several others have to undergo the trouble and expense of re-casting their cylinders before they come to the Island.

Some good running took place on Saturday morning, George on a Darracq perhaps accomplishing the quickest time, viz., forty-

being recorded. Several mishaps were reported. Roberts on an Arrol-Johnston dashed at a high speed into a herd of cattle which were being driven along the road near Cronk-y-Voddy. Two of the beasts were killed, and although Roberts and his mechanic stuck in the car they were uninjured, while the vehicle only received minor damage—a bent radiator and axle and a broken brake. A Coventry Humber struck a tree near Sulby without sustaining much damage, while several other mishaps occurred unworthy of mention. All the drivers speak of the bad condition of the course, but they anticipate a good race.

The Darracq "Four-Inch" Racers with their Drivers—Messrs. A. Lee Guinness, A. E. George, and A. Rawlinson—at the wheels.

The following is a list of the cars that have arrived in the island:—Rover, Mr. H. B. Browning; Arrol-Johnston, Mr. E. J. Cyril Roberts; Darracq, Mr. A. Rawlinson; Coventry-Humber, Mr. G. W. Brown; S.C.A.T., Mr. R. O. Harper; Arrol-Johnston, Mr. D. Resta; Darracq, Mr. A. Lee Guinness; Beeston Humber, Mr. James Reid; Calthorpe, Mr. Robinson; S.C.A.T., Mr. F. Ward; Hutton, Mr. P. D. Stirling; Arrol-Johnston, Mr. Geoffrey Moss; Darracq, Mr. A. E. George; Beeston Humber, Mr. T. C. Pullinger; Thornycroft, Mr. Tom Thornycroft; S.C.A.T., Mr. Harold S. Buckley.

With regard to the transport of cars to the Isle of Man, these are conveyed on cargo boats from Liverpool to Douglas by the Isle of Man Steam Packet Co. for 40s. per car, at owner's risk. Vehicles must be delivered at Salisbury Dock, Liverpool, between 8 a.m. and 6 p.m., on any week day, for shipment on the first cargo boat available. The cost for the transport of a car from London (Euston per L. and N.W.Rly.) to Douglas amounts to 152s. at owner's risk.

BY TELEGRAPH.

DOUGLAS, Wednesday.

Practising continued this morning in fine weather, but the rain of the past days rendered course slippery, and several cars had very near things at corners. Harper on S.C.A.T., travelling seventy miles an hour, had a hairbreadth escape at Hillberry Steps.

An unfortunate accident occurred to Gorden Usmar on a Vinot. From the tracks it appeared he took the corner at Creg Na Baa Hotel somewhat wide. The car skidded sideways, striking the wall, and turned over with Usmar underneath. He was extricated, and it was found that, excepting receiving a shock, he was uninjured. The car was slightly damaged, the near front wheel and the steering wheel being broken.

Lee Guinness took the driver and his mechanic, who was also uninjured, to Douglas.

The quickest time accomplished was fifty minutes for the circuit.

Several fresh competitors came out, including two Hillman-Coatalen cars and a Thornycroft, the latter driven by Baxendale.

The Huttons and Berliets are due to arrive to-day, and by the end of the week all the competitors will be here.

THE medical men attached to the Weald of Kent Hop-Pickers' Mission, which has twenty-eight evangelists and eleven medical workers among the hop-pickers, are making their visits on a car lent by a local motorist.

Mr. D. S. Hodge at the wheel of the Thornycroft Car he will drive in the "Four-Inch" Race in the Isle of Man.

The car is, generally speaking, similar to the Thornycroft Co.'s standard 18-h.p. four-cylinder type, and is fitted with high-tension magneto ignition, multiple disc clutch, gate change gear-box, with propeller shaft transmission and live axle. The petrol tank is behind the driver's seat, and has a capacity of about eighteen gallons.

six minutes a circuit, or a speed of fifty miles an hour; in fact, all the cars of this make went very creditably.

On Monday all the cars at present in the Island turned out for practice, but the mist on the mountains prevented good times

THE R.A.C. AT NORWICH.

ON Saturday the R.A.C. held its third provincial meeting at Norwich by invitation of the Norfolk Automobile and Launch Club, the proceedings including an official reception, when Prince Francis of Teck was received by the Sheriff (Capt. Fred Chamberlain) in the absence of the Mayor, among the welcoming company being the Lord-Lieutenant of Norfolk (Lord Coke), the High Sheriff of Norfolk (Mr. E. H. Evans Lombe), Colonel Kerrison (president of the Norfolk Automobile and Launch Club), Mr. Russell J. Colman, Mr. G. M. Chamberlin, and the Town Clerk (Mr. Arnold Miller).

After the meeting of the Committee, reported in our Club News on another page, the visitors were conducted round the Cathedral by the Dean, and in the afternoon a gymkhana was held at Crown Point. It could scarcely have been held in more happy circumstances. For one thing the weather was unexpectedly fine. A dreary procession of wet days ended with a cool, dull, but pleasant Saturday. The polo ground at Crown Point provided a delightful spot for the occasion, a wide level expanse of grass-covered ground encircled with trees being

with his 7-h.p. Singer were also in the final. At Tilting the Ring Mr. J. N. C. Day with a 16-h.p. Minerva proved the most expert; Mr. F. W. Fitt was second again; and Mr. John Hargreaves with a 22-28-h.p. Daimler, and Mr. J. Fison also won their heats. The "Musical Chairs," with the frequent spectacle of the ladies leaving the cars with desperate haste and frantically making for the vacant chairs round the bandsmen, excited great interest. The three cars that were left to fight it out were Mr. R. J. Colman's 10-h.p. De Dion, Mr. F. Lindus Forge's 14-16-h.p. Vauxhall, and Mr. A. R. M. Wood's 12-14-h.p. De Dion. With the two ladies in the first and last named falling, the lady in Mr. Forge's motor was the victor. Mr. Harold Collins won the Motor-cycle Potato Race. With the musical chairs a most successful gymkhana ended and the prizes were distributed by Mrs. Colman, the medal awarded by the club for the best performance being given to Miss Beryl Colman.

The Essex County Automobile Club held a reliability consumption run from Witham to Norwich on Friday. The distance was seventy-seven miles, and Mrs. Colman presented the cup to the winner, Mr. F. Lindus Forge, 14-16-h.p. Vauxhall. Subsequently Mrs. Colman was "At Home." Prince Francis of Teck

The R.A.C. Meet at Norwich.—The scene at the Gymkhana in the grounds of Mr. R. J. Colman.

approached by a fine drive. Some 150 cars assembled and ranged in a semicircle just prior to the commencement, which was made in the presence of a large fashionable gathering. The grass in the centre of the ground had been mown and flag staffs picked out about eight courses, each permitting a comfortable run for one car.

There were twenty entries for the Bending Race, Sir Percy Bates, Bart., in his 22-h.p. Berliet, Mr. H. W. Colliver with his 14-16-h.p. Fiat, and the 15-20-h.p. Renault owned by Mr. J. Fison contesting the final, which saw Mr. J. Fison emerge the victor, with Sir Percy Bates second. The Academy Race, with the humorous business at the blackboard and easel, provided much amusement. Mr. F. W. Fitt in his 20-32-h.p. Darracq was the successful competitor in the final, the winners of the other heats being Mr. A. R. M. Wood, 12-14-h.p. De Dion; Mr. W. P. Cubitt, 15-h.p. Humber; Mr. R. S. Clifford, 12-h.p. Richard-Brasier. The entries for the Bomb Race were numerous. Mr. R. S. Clifford succeeded in bursting the bladders in the quickest time; Mr. F. W. Fitt came second. Mr. J. Fison and Dr. H. G. K. Young

was present during the afternoon. The gymkhana was admirably organised, the officials being:—Judge, Mr. Edward H. Cozens-Hardy; starter, Mr. Alfred Finch; timekeeper, Mr. Mawdsley Brooke; assistant starters, Major Fowler, Captain W. H. B. Long, Captain Duff, and Messrs. F. E. V. Currey and F. Bullard; umpires, Messrs. W. R. Spelman, E. Mornement, F. A. Jackson, S. Howes, and G. Bullard; clerk of the course, Mr. A. C. Shepherd; marshals, Messrs. F. W. Doggett and L. W. Bennett; hon. secretary, Mr. G. N. C. Mann.

On Sunday the visitors had a very pleasant time. Starting from Norwich between 10 a.m. and 11 a.m. the cars made for Wroxham, the centre of the Broadland district. Quite a hundred must have made the journey and were delighted with what they saw. Several members of the Club had their launches in readiness, and both the big and little Broads were visited before lunch was partaken of at Horning. Later in the day Mr. and Mrs. H. L. Clark provided tea in their charming grounds by the riverside. On all sides the guests expressed themselves as delighted with the hospitality with which they had been received.

GOSSIP FROM PARIS.

POOR Wilbur Wright is not in luck just now. After breaking one wing of his aeroplane the weather was so bad during the week that he had to disappoint M. Lazare Weiler and all the members of his committee, to say nothing of a veritable flock of journalists and aviators who had gone to Le Mans to see him fly. After waiting several days all those distinguished persons had returned to Paris, when one morning there was a lull in the storm. At once Wright brought out his machine, but one of his assistants stumbled over a wire commanding the rudder. The aviator did not notice the damage which had been done till he was in the air. The rudder would not work, and Wright was fortunate in being able to return to *terra firma* without completely wrecking his machine. As it was only one ski was broken and a few wires snapped. Then the publication of his article in the "Century Magazine" and the long interviews he perhaps imprudently granted several French journalists did not improve his position. A good many people, seeing that after all Wright does not even pretend to have done much more than some of the French aviators, and that he has, like Farman, Delagrange, &c., to wait for calm weather to fly, are beginning to doubt whether his machine

believes he will be able to obtain the necessary authorisation, and which, in fact, offers considerably greater advantages for aviation, as it is something like nine miles long by six and a half broad. But it takes two hours by train to get to it.

M. RENE QUINTON is determined that the French aeronauts and aviators shall have the same support and encouragement as those of other nations. The Germans have their national subscription for Count Zeppelin, in Russia the Government has offered £6,500 in prizes for aviation, to be competed for at St. Petersburg next summer, and in Italy the King has instituted an aviation prize of £2,000, to say nothing of the minor or less approachable prizes, such as that for a flight from London to Manchester. Taking for model the Touring Club of France, M. Quinton has just constituted the Aviation League of France, with an annual subscription of five francs. He estimates that, as membership will give facilities for witnessing experiments, he will obtain at least 50,000 subscriptions in the first year, which will enable the League to offer handsome prizes. The influence of the association, which it is hoped will be of a really national character, will, says M. Quinton, be invaluable for the aeronauts and aviators. Let us hope it will; and if only it follows in the

Some of the Motor Wagons Leaving Paris for the French Military Manoeuvres.

is really so wonderful as it was said, and also whether he is much more skilful than his European competitors. Wilbur Wright must make haste to remain in the air an hour, otherwise he will risk losing much of the prestige he earned for himself by his first flights in France.

SEVERAL of the most prominent aviators, finding the Issy les Moulineaux parade ground too small for their future flights, are looking for a vaster field. Not very long ago one of them applied to the Government for permission to use the military manoeuvring-ground of Satory, near Versailles. When I met him soon after he was disconsolate. He had met with a refusal on the plea that the Satory camp contained so many military secrets that to permit aeroplane experiments on it, attracting crowds of people, was out of the question. I met him again this week, and he told me he had fathomed the mysterious reason for which the military authorities would not have him and his machine at Satory. It was because the aeronautic corps of the army have made an aeroplane of their own and mean to make experiments with it at Satory, where a shed has already been built for it. Most likely my friend will have to go to the camp of Chalons, for which he

steps of the T.C.F., and is as well managed, there can be no doubt of it. But there are not so many aviators as cyclists, and one may ask, What about the Aero Club, which is also supposed to use its influence in favour of the aeronauts and aviators?

MARNEY.

A MOTOR schooner belonging to Bergen, which brought a cargo of 350 tons of granite setts, arrived at Yarmouth on Monday. The vessel, which is the first of its kind to enter Yarmouth, is equipped with a paraffin engine which drives her at about five knots when loaded.

MESSRS. A. DAVEY AND SONS, who conduct an important motor agency at 116, Sidwell Street, Exeter, have opened an extensive garage on the Bath road. This has a wide entrance from the main Bristol-London road, and is fitted with modern machinery, the equipment including suitable offices, waiting rooms, cloak rooms, &c. Under the personal supervision of Mr. F. Davey a large staff of engineers is undertaking the repair of motor-vehicles of all types. The firm have two establishments at Exeter and another in Torquay, and intend to be of real service to motorists travelling between the two places.

THE SOCIAL WHIRL.

His Majesty will open the new Queen Victoria Memorial School at Dunblane on the 28th inst. We learn that King Edward will go by motor-car from Balmoral to Blairgowrie via the Spittal of Glenshee, familiar to all who have participated in the Scottish Reliability Trials in the past four years.

In the unavoidable absence of Countess Fitzwilliam, the Earl Fitzwilliam has just opened a bazaar at Barnsley in aid of the Yorkshire Society for Promoting Kindness to Pit Ponies. His lordship, who is interested in the motor industry, appealed to everybody who loved horses to support the society, stating that few people realised the drudgery which pit ponies had to undergo. When everyone on *terra firma* has a motor-car or can occasionally take trips by airship, inventors will probably turn their attention to motoring underground; and then will come the heyday of happiness for the little animals now down in the mines.

POLITICIANS seem to have been enjoying themselves on their cars during the last few days. Before they went for their holidays both the Premier and Mr. Haldane, the Secretary for War, had their cars fitted with speedometers, and Mr. A. J. Balfour has been travelling carefully around his estate at Whittingehame. He is now at North Berwick, where he

During his recent stay in Germany Mr. Lloyd George, the Chancellor of the Exchequer, visited a number of industrial establishments. The above illustration depicts him at the Factory at Oberschone-weide, where the N.A.G. Cars are built.

motored with Lady Frances Balfour on the Napier car illustrated in a recent issue. Mr. Lloyd George and Mr. Winston Churchill, too, who have been the guests of the Bishop of St. Asaph, have been motoring around Snowdon, and one day the Chancellor of the Exchequer, accompanied by Mr. Winston Churchill and Sir Hudson Kearley, motored to Criccieth to visit the historic castle of Criccieth and Gart Celyn.

THE Earl of Leven and Melville had a narrow escape from a serious automobile accident in the Pass of Killiecrankie one night last week. His lordship was proceeding from Blair Castle to Faskally House, when the car almost brushed a merchant's van standing at the top of the Pass. In endeavouring to steer clear the vehicle swerved, and the front wheels jumped a five-wire fence. It then rebounded on to the road, with the result that the axle was so badly damaged that the car was unable to proceed. The occupants of the car happily escaped unhurt, and were conveyed part of the way to Faskally House in the van, the automobile being later taken into Pitlochry for repair.

THE intersectional motor-car system adopted at the meeting of the British Association at Dublin was hardly

restricted to its legitimate purpose of assisting members to attend sections, as they were freely taken advantage of for a drive through the town.

IN consequence of a large number of Swedish gentlemen having joined the Motor Club in Coventry Street, W., it is proposed to secure the services of two Swedish cooks, the arrangement for their selection being left in the hands of a member in Gothenburg.

It was an unfortunate mishap at the four cross roads at Chailey, a village between Haywards Heath and Lewes, by which Julia, Marchioness of Tweeddale, the wife of Major Sir William Evans-Gordon, met with an accident last week. She had been staying with her sister at Lydhurst, Warringlid, near Haywards Heath, and was travelling to Crowborough on a car. Despite the warning signals at the cross roads, a collision with another vehicle occurred, and all the passengers were thrown out and severely bruised. The Marchioness sustained the greatest shock and was taken to the King's Head Hotel at Chailey, whither Sir William Evans-Gordon motored without delay. We learn that her ladyship is progressing as favourably as can be expected under the circumstances.

THE delights of the Highlands have been considerably increased by the advent of the motor-car, or, rather, some of their previous inconveniences have been minimised by the universal favour with which the automobile is now regarded. A visit to a country house in the Highland counties of Ross, Sutherland, or Argyll may involve a drive of twenty or thirty miles from the station. In the old days it was no joke if a wagonette or omnibus could not be obtained for a few hours, but now most Scottish hosts have their own motor-cars to send, and, seeing that police traps are unknown in some of the sporting districts of the north, speed soon swallows distance.

INTEREST is awakening in the International Rubber and Allied Trades Exhibition to be held at Olympia from the 14th to the 26th inst. Sir Henry A. Blake, G.C.M.C., is the president, with Col. W. J. Bosworth, of the A.A., as chairman. Mr. A. Staines Manders, the organising manager, informs me that twenty-five Governments will be taking part in the exhibition, and that a special Club room will be fitted up for the use of exhibitors, the *M.C.J.* being among the journals supplied for their intellectual entertainment. Messrs. Lyons will be responsible for the other fare.

It will interest Prince Francis of Teck, and those who are endeavouring to secure the fitting of speedometers on automobiles, to know that all the cars owned by Mr. Andrew Carnegie are thus provided. In the garage attached to Skibo Castle he has the following rules prominently placed, and his drivers are enjoined to carry them out to the minutest detail:—

RULES FOR MOTORMEN.

1. Every motor shall be equipped with a loud horn and speedometer.
2. The maximum speed is never to exceed twenty miles per hour, even on straight and excellent roads. Speed is to be greatly reduced in villages and over bad roads, and whenever a clear road cannot be seen far ahead.
3. In approaching every curve the speed is to be greatly reduced and the horn loudly sounded, curves to be taken slowly, and with great care, the horn to be sounded at intervals.
4. In taking curves the motor is always to be kept well to the left, the proper side of the road. Motors often take the inside of the curve regardless of the rule of the road. This must never be done by Skibo motors.
5. Careful, slow running, involving no risk is desired. Fast running is not enjoyed. Whether a few minutes more be consumed matters not. Our motors are pleasure vehicles, not racers.
6. The minimum time to be consumed between Skibo and Bonar Bridge Station (ten miles) is forty minutes; between Skibo and Dornoch (four miles) sixteen minutes. Even if guests miss trains, the time named must never be lessened.

All of our motormen are notably careful when meeting or passing cyclists, horses, sheep, cattle, &c., and for saving chickens, dogs, &c., and are favourites with the crofters and other people of the district who use the same public roads. We are very pleased at this, and ask them to oblige us still further by keeping the above rules to the letter, and thus avoid serious risk of danger.

LOLLIUS.

CONTINENTAL NOTES.

An Automobile Meeting at Royan.

A three days' motor meet was held at Royan, near Bordeaux, last week. The first day was devoted to a fuel consumption test over a 132 kilometre circuit, the honours falling to a car fitted with an Aster 8-h.p. single-cylinder engine, which consumed only 7 litres of spirit. The proceedings on the second and third days consisted of a series of standing mile speed trials for different classes of vehicles ranging from 100 mm. bore single-cylinder machines up to powerful racing cars. A Sizaire-Naudin covered one mile in 1 min. 54 sec., while Pierron on a Motobloc Grand Prix vehicle set up a new local record by covering the distance in 46 sec.

British Motorists in France.

Recent British motoring visitors to France include:—Mr. Wertheimer (60-h.p. Napier), Mrs. Chadwick (30-h.p. Renault), Mr. Welton, London (70-h.p. Fiat), Mr. Ruffer (40-h.p. Dietrich), Mr. Walter Kingsland (24-h.p. Panhard), Mr. A. Pyke and Mr. A. Shandon (20-h.p. Clement-Bayard), Lord Loreburn (45-h.p. Berliet), and Mr. J. Newton, Manchester.

Aeronautical Notes.

The past week has been a busy one in aeronautical circles in France. On Thursday, the 3rd inst., Wilbur Wright made a flight at a height of about 90 ft. and at a speed of 37 miles an hour, which lasted 10 min. 40 sec. A second flight was less successful, but is said to have been interesting on account of the ease with which the machine repeatedly rose into the air after touching ground. His best effort to date was made on Saturday, when he covered a distance of 16½ miles, at an average height 65 ft., in 19 min. 50 sec. Attempting a second flight, his machine was taken by a gust of wind as it made a very sharp turn and had one of the planes damaged. The honours of the week, however, rest with Delagrange, who, on Sunday, made an ascent with his aeroplane on the parade ground at Issy les Moulineaux, and established a new record by remaining in the air for 29 m. 53 sec., covering a distance of over 24 kilometres. Santos Dumont, of whom little has been heard lately, is, it is announced, having a new aeroplane built in Paris. Steps are being taken in Geneva to found a Swiss National League for aerial navigation. The French military airship République made a voyage of 125 miles in 6½ hours on Saturday.

Motor Racing in Russia.

A motor-car race from Tsarskoie-Selo to Strelina and back, a distance of twenty-five miles, was held a few days ago. In the over 40-h.p. category the winner was M. Tansky, who covered the distance on his Bianchi car in 37 min. 47 sec. The light car section was won by M. Efron on a four-cylinder Werner in 55 min. 42 sec.

American Motoring Tourists in France.

It is not only by British motorists that the attractions of France from a touring point of view have been recognised; the number of Americans who have this year come over with their cars has shown a remarkable advance, and in view of the endeavours of the various French, British, and American associations to facilitate the entry of visitors' cars in the country, the popularity of France is more likely to increase than diminish with foreign motorists. In order to meet the requirements of their clients in this direction two American motor-car manufacturers—the Pierce and Packard companies—have recently established depots in Paris, where a stock of spare parts for their respective vehicles are kept on hand, and where a large amount of useful work is also done in planning tours, advising on methods of shipment, and in giving information as to the means of passing from one continental country to another. In addition to the American Automobile Association being now represented in Paris, visitors from the United States largely profit by the excellent foreign touring branches of the various English organisations, the R.A.C., the Motor Union and the Automobile Association. By the aid of these various bodies all the

formalities, such as registration of car, payment of custom duties, &c., can be settled before leaving England. On arrival at the foreign port practically all that remains to be done is to attach the licence plates, have the triptyque signed by the customs officer, and drive away.

A Danish Volunteer Motor-cycle Corps.

A volunteer motor-cycle corps has recently been formed in Denmark. Each of the fifty members is equipped with a motor-bicycle and a Madsen automatic rifle, a revolver and a spade, as well as the necessary rounds of ammunition for both arms. The corps is to be accompanied by four motor-wagons carrying reserve supplies.

Public Services in France.

Negotiations are in hand for the formation of a company to establish a motor-'bus service to link up the towns in what is known as the *grande banlieue* of Paris—the villages and towns in a circle of twenty-five miles from the capital. The scheme under consideration is to form a huge belt line of motor-buses around the city, connecting such towns as Rambouillet, Mantes, Dourdan, Meaux, Senlis, Melun, Coulommiers, and Etampes. The type of vehicle it is proposed to adopt is a 24-h.p. petrol

Touring in Germany.—A View of Munich.

'bus, with inside passenger accommodation and considerable baggage capacity on the outside.

Miscellaneous Items.

Some trials are being made at Marseilles with the Mercedes-Electricque-Stoll system of electric motor-buses, which are operated on the overhead trolley system.—The Italian Züst car, a competitor in the New York to Paris race, arrived in Berlin on Sunday last, several weeks behind the winning German and American cars.—The death is announced of General Raaby, president of the Danish Automobile Club. The deceased was actively interested in the question of using motor vehicles for military purposes.—A party of Russian motorists, including Herr A. Nagel, Herr W. Lebedieff and Herr A. Efron, left St. Petersburg on the 24th ult. on a 30-h.p. Brasier car for a 10,000 kilometre tour to Riga, Berlin, Brussels, Paris, Nice, and back, *via* Genoa and Vienna.—A 50-h.p. Florentia car, fitted with solid tyres and a special system of suspension known as the Granieri, has just completed a run from Milan to Paris.

ACID can be prevented from leaking out of the vents of accumulators by various forms of valve vents and by care in properly fixing the accumulator in the car. The acid can also be made unspillable by making it into a jelly with silicate of soda, but this reduces the capacity in time.

THE TALBOT STEERING JOINT.

THE accompanying illustrations show some interesting details of the ball-jointed steering socket as fitted on the London-built Talbot cars. It is generally known that the steering socket is an extremely vital part of a car's mechanism, and one that calls for the utmost care in its construction. The Talbot steering socket, however, has had more than ordinary consideration bestowed upon it by its designers with the result that accidents through failure of the steering socket are unknown on the vehicles of the Clement-Talbot Company.

In Fig. 1, which shows the actual position on the car, SS. is the steering socket formed on the end of the coupling tube CT., and is connected to the steering levers by means of the ball joint BJ. The construction and method of application of this coupling is more clearly shown in the sectional view Fig. 2, where BJ is the ball joint resting in the half bearings HB and HB¹. The countershock spring CS retains the half bearing HB in position, and absorbs all thrusts transmitted from the front

Figs. 1, 2, and 3.

road wheels, due to inequalities in the road surfaces. The ball joint is allowed lateral play by means of the slot S formed in the top of the steering socket. A screwed plug SP holds the countershock spring in compression, and is prevented from working loose by means of the split pin shown.

Some idea of the complete immunity from mishaps afforded by this type of connection may be gathered from the fact that even were the countershock spring CS to become completely crushed or jammed up it would be impossible for the half bearing HB to slide far enough back to permit of the ball joint working out of the socket, whilst timely warning would be given through the steering wheel that something was wrong. Again, supposing the split pin holding the screwed plug SP were to be lost and the plug worked itself loose, allowing the countershock spring and half bearing to slide towards the end of the socket, it would again be an impossibility for the ball joint to come adrift from the socket, as the safety nut SN, which is screwed and pinned on to the threaded stem formed on the top of the ball joint, and which fits into the slot S, would hold the steering socket in place, rendering it possible to drive the car until convenient to pull up. The plan view, Fig. 3, shows the safety nut SN in position over the slot S, and demonstrates how impossible it would be for the steering socket to part from the ball joint.

MOTORING IN QUEBEC.

AS the recent tercentenary celebrations in Quebec have brought that district of Canada into prominence even from a motoring point of view, the following brief account of a run from Montreal through "the French country," as it is called, to Magog, Que., by a party of three British automobilists, which we take from our Canadian contemporary "Motoring," will doubtless prove of interest.

"Having crossed the St. Lawrence by the Victoria Bridge," writes the scribe of the party, "we followed the road along the south shore to Longueuil, and branched off there on the twelve-mile road leading directly inland to Chambly. The Richelieu River was reached at this point, and so far without mishap. As the ferry there, owing to the water having been lowered five feet in the dam, there was some difficulty to overcome in getting the car on board the scow that is used to transport vehicles across the river, but the ample clearance of the vehicle enabled us to manœuvre it with safety.

The villages of Richelieu, Marieville and Rougemont, which consist of little white cabins, with an occasional house of larger pretensions, clustered around a church that is easily the most dominating feature in the landscape, were the next points of interest. The people one passes on the road, the way the land is divided into long narrow farms, the appearance of the buildings, and the inevitable parish church, generally built of solid stone, in a style of architecture that is surely peculiar to this province—all are typically French-Canadian, and one does not expect to hear English spoken, so complete is the change that has come over the country in the last few miles. The road, unfortunately, is no exception to the general crudeness of the surroundings, and a particularly unlovely stretch just entering St. Césaire cost us one of our headlights, which was literally shaken off the bracket, and the car passing over it reduced the polished brass lamp to a twisted and almost an unrecognizable mass.

From there on to the end of the journey the mountainous nature of the country added greatly to its beauty, and the last two of the six hours that it took us to cover the 100 miles we had travelled were the most enjoyable of the trip. With the knowledge gained of the road, the return to Montreal was even more easily made the next day. After leaving the river on the outward trip, and between Longueuil and Rougemont, we found both horses and drivers very shy of the car, though the drivers were often more timid than the animals. The farmers were very friendly as a rule, and at our stopping places many of them took the opportunity of schooling their horses to the car. Stray horses on the road were far too numerous in the district, though the greatest danger is to the animals themselves. Such drawbacks as these, and the others that we encountered, will soon disappear, and it does not seem too much to prophesy that the route will one day be what it deserves, one of the most beautiful and popular in Canada."

As a result of many complaints of furious driving, the commissioner of the department of motor vehicles of the State of New Jersey, U.S.A., has decided to cease issuing licences for cars of more than 65-h.p.

ARRANGEMENTS are in hand for the holding of a series of dust, smoke, and brake contests in Central Park, New York, on the 23rd and 24th inst., under the auspices of the New York Automobile Association. For the dust trials a 200 yards course will be covered with fine crushed limestone and dried leaves, and the cars will proceed over it at a pace set by a flag attached to an endless belt arrangement the length of the course, which will be operated in accordance with the readings of a speed indicator fastened to its controlling mechanism. Not only the effects of the body and transmission gear in dust raising will be considered, but also the effects of different types of tyres. It is proposed in the braking tests to have not only motor vehicles, but trotting horses hitched to sulkies and business vehicles to demonstrate the superiority of the former in making abrupt stops when necessary.

FIAT MOTORS, LTD.

REFERRING to the full page advertisement which appeared in our issue of the 5th inst. with reference to the cars of the above company, we beg to state that such copy of advertisement was inserted inadvertently, and we are informed the Brooklands record therein stated as having been made by a Fiat car is not, and has not been claimed by them since July last.

HERE AND THERE

THE Porto Bello Hotel at Walton-on-the-Naze has good accommodation for motor-cars.

ENTRIES for the Brooklands Grand Prix, to be run on the 3rd prox., close on the 25th inst.

LIEUT. EDWARD NOEL recently made the journey from Jaffa to Jerusalem on his motor-bicycle.

A RENARD road train is being supplied for transport service in the forthcoming Aldershot Command Manœuvres.

THE drivers of the Arrol-Johnston cars in the four-inch race will be Messrs. E. J. Cyril Roberts, D. Resta, and G. C. G. Moss.

RECENT purchasers of Lorraine-Dietrich cars include Baron de Forest, Sir Nathaniel Dunlop, Mr. G. Bernard Shaw, and Major Barry.

MR. STANLEY BROTHERHOOD is amongst the latest purchasers of a Sheffield-Simplex six-cylinder car. The vehicle will be fitted with a limousine type of body by Hamshaw, of Leicester.

THE latest member of the motor trade to join the army of benedicts is Mr. E. Herington, the general manager of Ariel Motors, Ltd., who was married a few days ago to Miss Southan. Congratulations.

THE Barton Board of Guardians have passed a resolution asking the Government to place higher taxes upon automobiles of every description, and to make grants from the Imperial Exchequer in aid of the expenditure on main roads.

SOME kindly motor-car owners of Hull who were unable to send their cars on the Saturday of the recent cripples' outing sent their cars on Wednesday of last week, these including Messrs. Ernest Parker (Darracq); Nicholson (Singer); Annison (Darracq), driver M. Walker; Watkinson (Vulcan); and Frickey (Argyll).

AN instrument, designed by Colonel Holden, has been installed at Brooklands enabling a permanent record to be obtained on the Brooklands automatic electric chonograph of the acceleration of cars from a standing start up to 200 yards for every yard or foot traversed. Applications for acceleration tests should be addressed to the clerk of the course, Carlton House, Regent Street, S.W.

As an instance of the value of a small, fast, light car, we may mention the 18-h.p. Germain which Messrs. H. E. Hall and Co., of Tonbridge, have placed at the disposal of the police in connection with the Sevenoaks murder. The vehicle, which is being driven by Mr. H. O. Hall, has during the days and nights since the committal of the crime enabled the authorities to cover ground which with any other form of conveyance would have taken them weeks.

THE W. F. K. switch terminal is the name given to a useful little device which has lately been introduced by Mr. W. F. Kelley, care of Messrs. Wayte Bros., Motor Works, Lemon Street, Dublin. It consists of a combination terminal and short-circuiting switch for use on sparking plugs. The high-tension wire is first securely placed in position, and the switch terminal is then attached to the plug by means of the screwed nut in the usual way. Pivoted to the terminal is a brass finger which by means of a small insulated handle can be turned through a quarter of a circle, bringing it in contact with the metal portion of the plug, and so short circuiting the latter. The switch terminals form a handy and quick method of testing the ignition in petrol motors, particularly with multi-cylinders, as by the simple turning of the handle it can readily be seen whether the spark is properly passing in each cylinder without danger to the coil or magneto.

THE Newmarket Gas Company is setting an example to other gasworks in the country by undertaking the tar painting of roads and footpaths in the Newmarket district with the view of alleviating the dust nuisance.

MR. CHAS. E. WHITTAKER informs us that he has severed his connection with Weigel Motors, Ltd., and that he is starting in business on his own account. He has secured the agency for Great Britain and the Colonies for a comparatively new make of car known as the "Imperia," manufactured by Messrs. Piedbout and Co., of Liège. Mr. Whittaker has taken premises at 66, Great Russell Street, London, W.C., where in a fortnight's time he will have a range of the new cars, comprising 12-15-h.p., 16-20-h.p. and 22-28-h.p. models, on view.

ONE of the most important events of the week in the motor industry has been the announcement of the resignation by Mr. T. H. Woollen of his position as general manager of Clement-Talbot, Ltd. Mr. Woollen, who decided on the step some little time ago, and who, during his term of office, has done much to enhance the reputation of Talbot cars, leaves with the regrets and good wishes of the Earl of Shrewsbury and Talbot, the chairman of the company, who has asked him to select a few of the cups and medals won on Talbots as a memento of his con-

nection with the company. Mr. Woollen's successor is Mr. Frank W. Shorland, who for the last ten or a dozen years has been the London manager of the Raleigh Cycle Company, Ltd. Although, of course, Mr. Shorland's business has caused his name to be more closely connected with the cycle trade, he has kept up a close personal association with the automobile movement, his experience with motor vehicles dating back to the Emancipation run in 1896. There is probably not a British or Colonial motor agent who does not know Mr. Shorland personally, and as Clement-Talbot, Ltd., has since its inception made a strong feature of the agency system, we may be sure that under his management this will be still further developed and extended.

THE problem of the dustless and durable road is claimed to have been solved by the Teign Valley Granite Company, of Hennock, near Bovey Tracey, Devon, who, after long experiments, have placed on the market under the name "Targranix," a tarred matrix which is prepared by a special process, and which is composed of a proportion of 1½ in. and ¾ in., together with smaller granite chippings, blended with a special tar mixture, so as to form an adhesive conglomerate. The tarred mixture is laid on the granite metalling before the roller is applied, and in the proportion of one of tarred material to three of ordinary road stone. The pressure of the roller, while consolidating the metalling, presses the tarred chippings into all the interstices between the stones to a depth of 1½ in. to 2 in. The surplus Targranix forms a coating over the larger granite, giving the appearance of a tar-macadamised road. The total cost of metalling a road by this process is said to be only 1s. 3d. per ton more than if only raw granite is employed.

MESSRS. JOHNSTON BROS. have a motor garage at 86, Spring Gardens, Aberdeen.

A UNIC 12-14-h.p. car was last week successfully driven up Great Ormes Head, Llandudno.

MESSRS. VAN RADEN AND COMPANY, LTD., Coventry, have lately brought out a greatly improved celluloid type of ignition accumulator. While still retaining all the important features of their patent spun glass batteries in the new pattern, as will be seen from the accompanying sectional view, the plates are strongly carried by top and bottom supports and do not anywhere come in contact with the sides or ends of the celluloid

box, which, in addition to allowing the complete circulation of the electrolyte all round the plates, materially reduces the possibility of internal "shorts." The arrangement of the trough B below the vent hole in the top of the cell with the inserted glass wool, renders the battery absolutely unspillable, without in any way whatever interfering with the free escape of the generated gases to the open air, and ensures perfect filtration of the acid before it actually enters the accumulator.

WITH reference to our notes on speedometers on another page we would remark that the instruments described, as well as others to be reviewed in our next issue, are to be seen at the establishment of Messrs. A. W. Gamage, Ltd., in Holborn, E.C. That firm has a full range of such instruments, and their catalogue will be of considerable utility to motorists now acting on the advice of the chairman of the R.A.C.

WE are nearing the season of frosty weather—according to the calendar—and motorists who are troubled with cracked cylinders will be interested in a process of cast-iron brazing which is being successfully developed by the holders of the licences of the Tichon process in England and Wales. This we have seen in actual operation at the establishment of the Cast Iron Brazing Company in their Station Street works, High Street, Stratford, E., where many excellent specimens of repaired castings, &c., were seen in course of cleaning preparatory to delivery. The company are able to deal with broken castings, whether new or old, effecting the work expeditiously, efficiently and economically. Not only is the part restored to its original strength and serviceability, but it is made 50 per cent. stronger at the point of fracture, as is demonstrated both by the scientific and the anvil test. A great point in favour of the Tichon process is the saving of time that is ensured, for whereas it may take days to obtain a new casting only hours are required to save the "scrapping" of the old one. Any machinery in which cast iron is used can be repaired, such as gear teeth, eccentrics, motor-car and motor-bus engine cylinders, general engine parts—in fact anything that is in cast iron. Should a breakage with loss of the part have occurred it can be made complete in the minimum of time. The company is equipped for the prompt execution of work, and owners of garages and motor-car repair works will find the Cast Iron Brazing Company well able to assist them in undertaking automobile renovations that would otherwise be difficult, if not impossible.

THE R.A.C. is about to undertake the publication of Mr. Gerald Rose's Records of Motor Racing.

A NEW motor road service has been established in the St. Austell district by the G.W.R. Company.

MR. L. CROMPTON, of 19 and 21, Brook Street, Hull, is making a special feature of motor accessories.

THE Haslemere Parish Council, on the suggestion of the chairman, the Rev. G. H. Aitken, is writing to the A.A., asking what is the object of employing a scout on the roads of the town.

KIRKCUDBRIGHT's motor agents include Messrs. J. A. Macdonald and Company, in the High Street; Mr. George Williamson, in Bridge Street; and Mr. W. H. Penman, in Castle Street.

IN connection with the Manchester Electrical Exhibition a motor garage will be provided, and the Manchester Taxicab Company have arranged to keep some of their vehicles on a special rank immediately outside the display.

FREE accommodation for motor-cars was accorded members of the R.A.C. at Norwich last week-end at the following motor-houses:—Messrs. Howes and Son, Chapel Field; Messrs. Mann, Egerton and Co., Ltd., 5, Prince of Wales Road; Mr. A. Spaul, Castle Hill; Messrs. Thorn, St. Giles; the Victoria Garage Company, St. Stephen's Road.

MESSRS. S. F. EDGE, LTD., have sent us a couple of photographs depicting an interesting test, which was recently made to demonstrate the absence of vibration of the Napier 40-h.p. six-cylinder car. The test in question was that of standing a penny on end on the flat surface of the radiator filler cap while the engine was running. It was of course necessary to first get the car and the radiator on the level, but after this was done the penny balanced itself on its edge for a period of 56 sec. It is not an easy matter to balance a pennypiece at any time, and the fact that it was done on a motor-car with the engine in operation is a splendid testimony to the smooth running of the motor.

Profile of the Isle of Man Course for the "Four-Inch" Race.
(Automobile Club Journal.)

WE have received a sample tin of a new motor grease known as "Ridgoleum," which has lately been put on the market by the Kidgill Manufacturing Company, of Dronfield, Sheffield, and which we hope to try and report upon in a later issue. In the meantime we may mention that the new grease is recommended for use in gear-boxes, and that several advantages are claimed for it. It is stated, for instance, that it not only prevents any annoying leakage of oil at the bearings, but that it does not, as is often the case with ordinary grease, merely adhere to the sides of the gear-box, but spreads itself over the pinions to such an extent that there is always a film of lubricant on the teeth.

SUCCESSFUL SPEEDOMETERS.

FOLLOWING the advice of Prince Francis of Teck with regard to the use of speedometers, we commence the publication of a series of notes on the various types on the market.

The O.S. Speedometer.

In Fig. 1 we illustrate the O.S. speedometer which was introduced to British motorists by Messrs. W. Searle and Co., 33, Glasshouse Street, Regent Street, London, W., a few years ago. It promptly rose into

Fig. 1.

favour, attracting attention by reason of the magnetic principle, which is its distinctive feature, and the transmission from the cardan or the sprocket shaft. With regard to the first point, a horseshoe magnet is revolved in a lateral direction. This sets up Foucault or eddy currents which, acting through the "keeper," exert attractive force on a copper disc to which the indicator needle is fixed, tending to revolve it in the direction of the magnet's rotation. An antagonist hair spring, attached at one end to the "keeper," which is stationary, and at the other end to the spindle carrying the copper disc, prevents the complete revolution of the copper disc, but allows it to deviate in proportion to the speed of rotation of the magnet. The needle moves round with it and thus indicates the speed on the dial. The advantages claimed for this system are its simplicity, directness, and length of useful life, the magnet being guaranteed almost indefinitely against demagnetism. Now, concerning the drive and transmission, a split pulley fixed on the shaft is connected by a spring belt to one end of the flexible transmission. There is no slip, no loss of power, by its allowing a certain give in extreme stress. The drive being away from wheels is not spattered with mud nor is it likely to become wet, whilst its life is considerably increased. The device is particularly neat, as only the speedometer and a small length of transmission, which comes up through the footboard, is shown on the dashboard. Messrs. Searle and Co. have a testing room where every instrument is run and tested against a standard speedometer. In the event of any owner desiring it, the firm will test from time to time any instrument obtained from them.

The "Jones" Speedometer.

The fact that the "Jones" speedometer secured the gold medal of the R.A.C. in the only speedometer trials held in this country has given it a distinction which has materially assisted its progress in the auto-

Fig. 2.

mobile world under the tutelage of Messrs. Markt and Co., 6, City Road, London, E.C. We illustrate (Fig. 2) Model 15, fitted with a maximum speed hand, which is carried forward by the regular hand, and always remains at the highest point of speed attained—a maximum reading that should prove useful in the refutation of prejudiced police evidence. When released by a touch on the resetting stem this hand drops automatically and instantly to the speed at which the car is at that moment travelling, remaining there even after the car is subsequently stopped. By a single turn of the resetting stem the maximum hand may be dispensed with by both hands being made to act as one, showing the variable speed only. Another important point is concerned with the disclosure of any unauthorised use of the car, as the resetting stem can be sealed against use without knowledge on the part of the owner. So much for the maximum hand. The principle of construction of the Jones instrument is based upon

centrifugal force—a principle which secures accuracy of speed and mileage in the device. Messrs. Markt and Co. claim that the only satisfactory form of drive is by gears rather than friction. The drive also should be taken from the front or steering wheels in place of the rear wheels or engine shaft, as there can scarcely be any slipping in the former case, whereas there is always the likelihood of slip in the drive from engine shaft or from the rear wheels of the car. If desired, however, they are prepared to supply the "Jones" with drive direct from the cardan shaft or live axle. A complete technical description of the apparatus has been prepared, and this will be sent to readers on application; meanwhile suffice it to say that experience has given this type popularity on account of accuracy, durability, steadiness of reading, simplicity of construction and attachment, rapidity of response to variations of speed, as well as price. Several models of the speedometer are made, and mention should also be made of the "Jones" odometer or mileage recorder.

The Simplex Speedometer.

Another speedometer which has distinct merits and is supplied at a reasonable price is the "Simplex" speedometer of the United Motor Industries, 45 and 46, Poland Street, London, W. The essential feature of this device consists in the applica-

Fig. 3.

tion of balls for the transmission of centrifugal force developed by the axis of rotation. By means of rotating discs, with balls running freely in compartments, the action of centrifugal force tends to press them to an extremity which is held in check by levers acting upon an outer ring. This forms the axis of the indicating hand, and by a mathematical calculation governed by the diameter of the turning wheel the correct rate of speed per hour is ascertained. There is no loss of energy by this means, as the action is instantaneous. We illustrate Model 2 of the Simplex speedometer fitted with a trip recorder up to 10,000 miles and mileage for each run. On behalf of their speciality the United Motor Industries point out that it begins to register accurately even at a very low speed; that it gives the speed at the instant that the speed is being accomplished; that the speeds from five miles an hour upwards are absolutely correct; that the needle or hand points steadily, and its movement along the dial is steady; that there is nothing to get out of order, and that the dial is clear enough to be easily read from the seat on all occasions. A lubricant is advised by the makers in the transmission shaft, this taking the form of their well-known "Non Fluid" oil, a speciality which the United Motor Industries, Ltd., have been handling for some time, and a substance something after the consistency of vaseline. The bracket axle on which the aluminium wheel is mounted of course is run in ball bearings and is fed by the lubricant in the flexible shaft casing. Another interesting feature of this speedometer is the guarantee which it carries, namely, if the lead seal which every instrument is sealed with is not broken, the guarantee has no limit of time.

The Stewart Speedometer.

In Fig. 4 is seen the Stewart speedometer introduced to this country by the Stewart and Clark Manufacturing Company, 11, Denmark Street, Charing Cross Road, London, W.C. This is a neat instrument of tried repute operated by a positive drive. The firm give an extended guarantee with their instruments, and give their prospective customers a thirty days' trial, where desired, which, as the company suggests, "is the best we can do next to giving them away."

Fig. 4.

Smith's Speed Indicators.

Next week we shall publish illustrations of other notable speedometers upon the market, including the Speed Indicator of Messrs. S. Smith and Son, 9, Strand, London, W.C., which has recently secured acquittals at Christchurch, Horsham, Reigate, and Chertsey.

Correspondence.

(Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.)

THE USE OF EXHAUST WHISTLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Prince Francis of Teck has published a letter in your columns in which he touches on many of the questions with regard to the use of motors on the public roads which are now greatly agitating the minds of both motorists and the public generally.

With many of Prince Francis's recommendations I, as one who uses motors regularly, cordially agree. But there is one to which I take considerable exception. It is that in which he suggests that the use of exhaust whistles and other similar warning instruments should be dispensed with for the future.

I gather that he does not object to the use of the ordinary bulb; but I would point out that in a vast number of instances—especially when driving in the country—the bulb is not in the least attended to by those in charge of carts or carriages, or, indeed, by foot passengers.

Under these circumstances it is absolutely essential that some other method of calling the wandering attention of those persons should be adopted; and while I deprecate as much as any one the undue use of noisy sirens or whistles, I feel certain that every motor should have attached to it some such thing, especially if they—the cars—are much used in country districts.

Personally, I greatly prefer an exhaust whistle to a siren, which makes an unnecessary and dismal sound. But to the value of a whistle

The O.T.A.V. 54-h.p. Car which successfully competed in the Essex Motor Club's recent 24-hour run from Woodford to York and back.

on the exhaust I can confidently testify. In most counties it is largely the custom of those in charge of carts and similar vehicles to drive either exactly in the middle of the road or on the wrong side of it—why this should be I cannot say, but so it is—while pedestrians constantly use the road in preference to the footpath at its side. Now, no particular objection need be taken to these customs so long as those who adopt them conform to the usual rules of the road when other users of it wish to meet or pass them. But to the warning of the bulb but scant notice is given, whereas a couple of blasts on the whistle invariably attracts the necessary attention.

Again, anyone who motors much in the neighbourhood of London or any large town, especially on a Saturday or other local holiday, is constantly coming across members of bicycling clubs indulging in one of their "runs." They usually travel in a kind of loose skirmishing order, covering the entire breadth of the road. Unless their attention is called by an exhaust whistle or something of a similar nature it is often almost impossible to avoid being run into by some of the riders; for many of them are crouched over their handle-bars in such a way as to render them apparently ignorant of the presence on the road of any other conveyances, and it has constantly happened to me that no notice whatever of the bulb warning has been taken by cyclists out on such "runs," but that the whistle was at once effective.

Moreover, I have found on many occasions that pedestrians on the road are far more influenced by the whistle than they are by the bulb. For these reasons I trust that the R.A.C. will not, without grave consideration, try to influence motorists in the direction of using only the bulb, especially as whenever an accident occurs great stress is always laid on the point as to whether the driver of the car has given every possible warning by his bulb, whistle or siren.

To limit chauffeurs to the bulb only would be to inflict an undue hardship on the motoring community, and would certainly not add to the convenient user of the public roads.—Yours truly,

RUTLAND.

WHY LONG-STROKE MOTORS?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the present great interest that is being taken in the very incomplete R.A.C. formula for rating motors, it seems to me it is worth consideration why competitors in racing events have started developing the long-stroke engine. Ordinary commercial engines have got down to a reasonable proportion between stroke and bore; in fact, I think every up-to-date motor-car maker was considering quietness, smoothness of running, and economy in tyres and mechanism almost before everything. Then the Royal Automobile Club and the Automobile Club of France both suddenly started rating engines for competitive purposes by the size of the cylinders only. The result of this was that the far-seeing manufacturers, who understood their business, at once realised that these two clubs had brought out a formula which placed no restriction on stroke. Experiments were at once carried out, and it was then found that increasing the length of the stroke was almost as good as increasing the bore.

In developing the formula, diameter of cylinders squared multiplied by number of cylinders, divided by 2.5, the compilers of the same no doubt assumed that long-stroke motors would be run at slow speed, or, in other words, the speed would be inversely proportional to the length of stroke, and that the limit to speed and stroke (that is to say, piston speed) would be the strength of the moving parts. This, however, is not the limiting factor, for it is possible to make these parts of material of such excellent quality, which, correctly disposed within the parts, ensures that their actual strength is much greater than the stress which they are called upon to withstand, with the motor running at maximum speed.

There are two chief factors which limit the engine speed:—(1) The actual rubbing velocity of the pistons within the cylinders. (2) The rapidity of actuation of the valves, and the speed with which the gases can be taken in and expelled from the cylinders. With the piston speeds at present in vogue, even in races where they are maintained at the highest limit, it is possible to get over the piston lubrication difficulty by judicious lubrication at the expense of a smoky exhaust. The second factor, therefore, is the chief limitation so far as the engine speed of racing motors is concerned. There are other factors which limit the speed, such as the rate of ignition, inflammation and combustion of the gases, the speed of the ignition apparatus, &c., but the effect of those things is not so great as those above mentioned. The rapidity of actuation of the valves does not depend upon the length of stroke of the motor, but since the speeds of motors of different strokes but of the same bore have been found to be practically the same, it follows that the powers are approximately proportional to the length of the strokes. Racing motors which have a limited piston area, and from which it is desirable to obtain the maximum power, have, therefore, to be fitted with excessively long strokes.

The formula rates a motor with a short stroke the same as one with a long stroke, provided the piston area is the same in both, and although the performance of the long stroke motor, so far as actual horse-power is concerned, is undoubtedly better than the one with the short stroke, yet by rating their performances should be similar. Actual experience teaches that the formula does not give a true rating, and if the rating is to be a measure of the horse-power developed, the length of stroke must be introduced into the formula. It seems so very simple to have a formula which takes into account stroke, and I do think that, whatever formula is selected, it should be reasonably near the actual brake horse-power that the particular engine being calculated should give, if it was a modern, efficient, commercial engine.

The calculation of the power of an engine must necessarily be based upon the force behind the piston and the speed at which it moves, whatever means are taken to express this; that is to say, we have three factors which it is necessary to ascertain before the power of an engine can be calculated, namely, the area of the piston, the pressure per square inch to which this area is subjected, and the number of feet through which the piston moves in one minute. It is obvious that it is only on the first of these three that definite limits can be put, and that any limits selected for the other two figures must be purely arbitrary and liable to require revision from time to time, the only alternative being to measure them on each individual engine. It seems to me that this would be too big a task to be undertaken for general purposes, and that the simplest way is to select what is known to be a fairly high average in each case. This would mean that designers would be stimulated to raise those figures to the greatest possible extent.

If we start with the usual horse power formula $\frac{P \times A \times S}{33,000}$ where $\frac{D^2}{4}$
 P = mean effective pressure in lbs. per square inch, A = 11 times $\frac{D^2}{4}$
 S = $L \times N \times 2$ = piston speed in feet per minute, where L = length of stroke in feet, and N = number of

revolutions per minute; the simplest way is to boil it down by obtaining a constant from all the known or arbitrarily selected figures by which the variables can be multiplied or divided. To illustrate this, I assume a mean effective pressure of say 80 lb. per square inch, and a piston speed of say 1,400 feet per minute, we then get the following formula from the above:—

$$P \times L \times N \times 2 \times 11 \times D^2 \\ 4 \times 4 \times 33,000.$$

Assuming a square engine, say 5 in. by 5 in., a piston speed of 1,400 feet per minute would involve a speed of 1,680 revolutions per minute, the formula therefore becomes:—

$$80 \times L \times 1,680 \times 11 \times D^2 \\ 2 \times 4 \times 33,000 = L \times D^2 \times 1.6,$$

the result being the horse-power of one cylinder. Assuming a 5 in. x 5 in. engine, this formula gives 16.5-h.p. per cylinder, a figure quite easy to obtain, but assuming the stroke increased to 7 in. the formula gives 23-h.p. On the other hand, for a 4 in. stroke 13.3-h.p. is obtained. The difference in horse-power between the extremes in this formula seems to me rather great, and possibly would tend to too much restrict the permissible variation in stroke. The way to correct this would be to use the square root of the stroke as a multiplier and suitably reduce the constant; this gives us the following formula:—

$$L \times D^2 \times 1 = H.P.$$

This gives us for a 4 in. stroke cylinder 14.25-h.p.; for a 5 in., 16-h.p.; for a 6 in., 17.5-h.p.; and for a 7 in., 18.9-h.p. These proportions are in accordance with practice. At the same time, the variation between the extremes should be sufficient to restrain designers from adopting extremely long or extremely short strokes. The reasons for wishing to handicap the long-stroke motors lie in the engines themselves. They present many difficulties, and are not so well adapted for driving motor-cars as are engines with shorter strokes.

The chief objections to excessively long strokes are:—(1) size of engine, (2) vibration, (3) weight of engine, (4) noise from engine, (5) lack of flexibility, (6) difficulty of starting, (7) danger from pre-ignition, (8) necessity for stronger shafts, &c., in transmission gear, (9) increased wear and tear on tyres.

(1) *Size of engine.*—Long stroke engines must have proportionately long connecting rods, and on this account the distance from the centre of the crank to the top of the cylinders is considerable, and the oil base must also be very deep to allow for the swing of the crank. In order to get sufficient clearance between the oil base and the road it is necessary to carry the crank shaft higher in the frame, which necessitates raising the gear-box, clutch, and most of the other parts. This raises the centre of gravity of the car considerably, and thus it is more easily overturned, and skids more readily. The engine being built very high necessitates a higher dashboard and bonnet, and the seats must therefore be raised to give a clear view, which also raises the centre of gravity of the car. The increased space required for the crank to swing in necessitates the use of a larger crankcase, which occupies space usually taken up by the magneto, water pump, &c., and these have to be placed in more restricted positions where they are less accessible.

(2) *Vibration.*—However well balanced an engine may be, there is always a slight amount of vibration. This need not be very much with short stroke motors, but with excessively long strokes it becomes very serious. It is due to the inertia forces of the reciprocating parts causing the crankcases and crankshafts to distort and "whip," and, in addition to the discomfort of riding in the car, there is the grave danger of the crankshaft breaking through fatigue due to the vibration.

(3) *Weight of engine.*—Excessively long-stroke motors are exceedingly heavy. They are very high, the crankcases are very large to accommodate the swing of the crank, the valves must be large so as to allow the large quantity of gas easy ingress and egress, and the valve ports, pipes, cylinder heads, &c., must be in proportion. The reciprocating parts must be made heavier than those for equal bore short-stroke motors. It is also necessary to employ a heavier design of crank case and oil base in order to make these strong enough to withstand the stresses due to high speeds combined with long strokes, and in order to withstand the vibration the crank-shafts must be made considerably larger in diameter. These conditions result in an engine which is considerably heavier than an engine of equal power with a shorter stroke and greater bore.

4. *Noise from engine.*—This is due to vibration and valve actuation, and is so well known that nothing more need be said about it.

5. *Lack of flexibility.*—The long-stroke motor is not flexible. The compressions require so much effort to overcome them that the necessary weight of flywheel is prohibitive.

6. *Difficulty of starting.*—In order to turn the long-stroke engine by hand it is necessary to have a half-compression gear even for engines of comparatively small bore.

7. *Danger from pre-ignition.*—This is considerable, for although the pressure in the cylinder due to the pre-ignition may be no higher than that in a short-stroke motor under the same conditions, yet, the crank arm being longer and the connecting rod being in a more oblique direction, the actual stresses induced in all parts are considerably higher.

8. *Necessity for stronger shafts, &c., in the transmission.*—Owing to the uneven torque due to the long stroke and the wide variation between maximum, average, and minimum torque, it becomes necessary to design the shafts to suit the maximum stress to which it is considered

they will be subjected. Increasing the size of these shafts also adds to the weight of the chassis.

9. *Increased wear and tear on tyres.*—This is due to the uneven torque of the long stroke motors, the increased weight of the motor and chassis, and the greater amount of skidding between the tyres and the road.

I think you will agree with me that the above is a good case against the abnormally long stroke motor, and that it has no reason for existence except for the purpose of getting the better of a formula which is inadequate for present day conditions of motor-car engine manufacturing. The ordinary purchaser can always reckon that his tyre bill will go up in accordance with the increased length of stroke.—Yours truly,

S. F. EDGE.

MOTOR-CARS AND DUST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think it must be generally admitted that the amount of correspondence going on now in almost every class of paper against motorists is anything but pleasant reading. I have been very much struck in noticing that amongst the various charges brought against motorists, if carefully analysed, the dust nuisance is by far the greatest. Unfortunately there is a lot of reckless driving, and there are some people who seem to be void of all common sense and good feeling, but even with such driving I am quite certain there would be much less complaint were it not for the dust caused.

My object in writing this letter is to see if the motor Press, which is a very influential body, cannot by means of discussion get something

The Blackdown Landulet just supplied by the Daimler Co. to His Highness the Maharajah of Nepal.

done in the way of having the clearance of cars increased, because this is undoubtedly one of the worst causes of dust, and I am very glad to notice that Col. Crompton some few weeks ago was equally emphatic on this point. Take, for instance, the Stanley steam car; its dustiness is not because it is a steam car but because the car is about 3 in. higher than the average petrol car, and generally has good clearance. As Col. Crompton put it it seems to have been accepted as an absolute necessity that petrol cars had to be built with a very low centre of gravity, whilst, in his opinion, there is no need for such a thing except in racing machines, and the less this type of machine is on the road the better. No doubt the average motorist will at once imagine that his car is going to look very ugly because it is made 3 in. or more higher from the ground, but I would only repeat that it is purely a question of fashion. Let all cars be built the same, and we shall be quite accustomed to accept them as all that cars should be. Even if it were not so, it is surely better to sacrifice something in the way of beauty if it will do anything towards lessening the obstacles which are already in the way, and likely to increase by further legislation.

So far as the low centre of gravity is concerned there has not been the slightest tendency to overturn on any corners with a car so built, and this on a bending road, at a speed which worked out at 30 m.p.h. average, which I think should satisfy most people.

The authorities are doing as much as they can towards improving the roads to make them as dustless as possible, but the cost is very heavy indeed, and motorists cannot reasonably expect the country at large to pay for what is merely made necessary owing to the way the roads are being used by what is, after all, quite a small section of the public.

I was particularly interested to read a letter in the *M.C.J.* of

August 29th, from Mr. T. R. Bulley, in which he gives a report of a discussion of the Cheshire County Council, and would particularly call attention to their proposal, "If the power were given to stipulate for a proper minimum space between the bottom of the car and the surface of the road, a considerable part of the trouble would be over, as it would become dangerous to go very fast, especially in turning corners (owing to the higher centre of gravity), and both speed and dust would be automatically reduced, probably to a reasonable degree."

This exactly summarises what the writer has had in mind for some considerable time, and he trusts that motor manufacturers will take up this point with the seriousness that it deserves.—Yours truly,

L. T. R. RIDLEY.

SOME NEEDED IMPROVEMENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was glad to read the note on the subject in a recent issue of the *M.C.J.*, and, responding to the invitation, I venture to suggest that all makers of chain-driven cars should follow the example of one or two makers and fit chain cases to their cars. It has always been generally recognised and freely admitted that driving chains would be more satisfactory if protected from the mud and dust, and run, if not in an oil bath, at least in a dust-proof can. There appears to be no reason why a good chain-case cannot be made, although the matter is manifestly one which requires some experiment. Much of the popularity of the live axle car is undoubtedly due to its quietness and the small amount of care it requires, and I am sure that the general adoption of oil-tight chain-cases would result in an increased use of chain-driven cars.—Yours truly,

R. SIMPSON.

KNOCKING IN THE ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The engine of my double-cylinder car has recently developed a knock which I cannot locate. It sounds just as if the crank shaft bearings were loose, and is not the click or knock that is heard from advancing the ignition too far. The noise comes from both cylinders. I have had the engine to pieces, and found the piston rings and crank shaft bearings in excellent condition. The motor runs with perfect regularity, has full power, and never misses an explosion. The valves have been carefully ground, and new springs put on the stems, of the same strength, as nearly as could be determined. Both cylinders register a compression pressure of 65 lb. per sq. in., and hold it. By careful adjustment of the ignition and mixture the engine can be made to run so you can scarcely hear it, and this with full load and with any of the speeds. When, however, the accelerator is opened, or a slight rise in the road is met, the bumping commences alarmingly. Even when the knock occurs the engine works with regularity, and there is no difference in the sound of the exhaust. Everything sounds perfectly normal with this extra noise added, and sometimes I am inclined to think it must be outside the engine. The car has three speeds forward, sliding gear transmission, and bevel gear drive, and the noise is not only heard, but the knock felt in the machine.—Yours truly,

PUZZLED.

[It is not quite clear what our querist means by saying that the engine will run perfectly silent "with full load" by careful adjustment of the mixture and ignition, and yet that when the accelerator is opened on a rise it makes a noise, because it is only under the latter circumstances that the engine can really be working under full load. The accelerator we presume controls the opening of the throttle, and unless this is opened and the ignition advanced to a reasonable extent, the motor cannot be considered to be working under full load. Perhaps the flywheel is loose on the crankshaft; this would account for the sort of knock complained of. Or, if this is not the case, there may be a slight amount of slack in the gudgeon pin bushes, which also would be the cause of a knock that would be more pronounced (or perhaps only perceptible) on climbing a hill if the play is very slight. We do not think the knock is outside the engine, but this can be tested by running it with the gears in neutral, and then applying a brake by means of a short plank fulcrumed so that a pressure can be brought to bear in such a way as to let it rub hard under the flywheel. A piece of cork fastened to the plank will enable a good rubbing friction to be obtained without undue pressure. By putting a "load" on the engine in this manner it will be possible to make sure whether the trouble is external to the motor or not. The aid of a friend to control the throttle and ignition is advisable.]

IN connection with the letter on magnetos in our last issue Mr. T. Lang writes that he has a 1905 9-11-h.p. Clement-Talbot car with a low tension magneto which is still running without an atom of trouble.

WILL the driver of a motor-car (two-seater) who apparently ran over a very small black dog, the dog running away, on Monday morning, August 17th, at 10.45 a.m., in Highbury Quadrant, North London, communicate with Mr. C. H. Crole-Rees, 21, Highbury Quadrant, N.?

A TAIL LAMP has been found on the road near Beverley Bridge. If the owner will communicate with the secretary of the Automobile Association, Princes Buildings, Coventry Street, W., with a description of the lamp, every assistance will be afforded him to recover the same.

THE R.A.C. AT NORWICH.

ON Saturday, in the Thatched Assembly Rooms, Norwich, the third provincial dinner of the R.A.C. was held. The chair was occupied by H.S.H. Prince Francis of Teck, who had the support of the High Sheriff of Norfolk, the Sheriff of Norwich, the Dean of Norwich, Colonel E. R. A. Kerrison, Sir Percy Bates, Mr. Colman, Dr. Young, Sir C. B. Locock, Mr. G. C. Davies, Mr. G. M. Chamberlin, Mr. J. Cator, Mr. E. H. Cozens-Hardy, Captain Skeffington-Smyth, D.S.O., Mr. W. C. Crawshaw, Captain Athill, Mr. W. W. R. Spelman, Mr. Lindus Forge, Mr. H. L. Clark, Mr. E. Reeve, Mr. H. W. Williams, Mr. J. Hargreaves, Mr. G. Colman, Mr. A. E. Collins (City Engineer), Mr. T. H. B. Heslop (County Surveyor), Mr. E. F. Winch (Chief Constable of Norwich), Mr. G. M. Lason, Major and Mrs. Fowler, and Mr. J. W. Orde.

After the loyal toasts had been honoured, Capt. Skeffington-Smyth, D.S.O., proposed "The Health of the County and City Authorities," the High Sheriff (Mr. E. H. Evans-Lombe) making the first response. There was a feature upon which they congratulated themselves in Norfolk, and that was the very sensible and practical view that their Standing Joint Committee and the police took of the question of motor-ing. A man who drove carefully and with due consideration of other users of the road had nothing to fear from police traps in Norfolk. The only traps he knew of were those set in the narrow entrances to some of the small towns and villages, where it was very dangerous to drive at anything but a very slow speed, and any man who was caught in any of these traps would only get what he deserved. The Sheriff of the City also replied.

H.R.H. Prince Francis of Teck replied to the toast of "The Club," proposed by Col. E. R. Kerrison, C.M.S. The Prince said it was his very pleasing duty to announce that the Club's medal had been, by the advice of the judges, accorded to Miss Beryl Colman. It was a great delight to him to preside on that occasion, because the numbers present showed that the work begun at the beginning of this year in regard to the association scheme had been thoroughly appreciated. One of the principal points of that scheme was decentralisation. In other words, the R.A.C. was desirous of strengthening the provincial clubs and assisting them to acquire greater influence in their respective spheres of operation. When the committee of the Royal Automobile Club next met it was his intention to bring forward a proposal for tackling the dust question and the still more important question of inconsiderate driving. He could only hope that the Norfolk Club would do its share towards the suppression of what were undoubtedly nuisances. Further legislation for motorists was coming soon. In view of that prospect he was glad to think that Mr. John Burns, whose duty it was, as a Minister of the Crown, to bring forward that legislation, was a friend of the automobilist; but he, with all his goodwill, could not assist them unless they assisted themselves.

Mr. G. M. Chamberlin proposed "The Visitors," on whose behalf the Dean of Norwich made response in a facetious speech.

At the meeting of the General Committee of the R.A.C. at Norwich on Saturday there was a good attendance and fourteen provincial clubs were represented. The scheme for the establishment of machinery for dealing with Inconsiderate Driving was considered and adopted. Reference to this is made in our Comments on another page.

Mr. C. T. Cutler, on behalf of the North Middlesex A.C., moved that the R.A.C. should consider the advisability of devising some means whereby local clubs could become affiliated to the R.A.C. and the M.U. at a reduced affiliation fee. This was seconded by Sir Percy Bates, of the Cheshire A.C., and after some discussion it was agreed to.

The meeting of the Organising Committee of the Club was held on the 4th inst. at Norwich, when it was agreed to ask the Legal Committee to take into consideration the question of the appointment of local solicitors.

THE WORTHING CARNIVAL.

IN connection with the Worthing carnival a procession of decorated cars was held on the 3rd inst., but unfortunately the weather seemed opposed to any great display being made. Despite this, however, several motorists ventured forth and some very good decorations were made, the judges' awards being as follows:

Decorated Motor-cars.—1, D. H. Langhorn (London); 2, Mrs. Chapman (Broadwater); 3, E. M. Rodocanachi.

Decorated Motor-cars (confined to two-seated cars, or motor-cycle and trailer, or similar machine).—1, Otto Brown; 2, Stafford Baxter; 3, W. F. Rowland.

EYQUEM'S PATENTS, a new concern with offices at 31, Duke Street, St. Mary Axe, E.C., have lately introduced a pink powder known as "Softene," which is claimed to be an improvement over the ordinary French chalk used inside motor tyre covers.

DURING the last three months Messrs. Jarrott and Letts have successfully overhauled, at their repair works at Willesden Junction, in addition to the Crossley, De Dietrich, Mors and Sizaire-et-Naudin cars, the following makes:—Panhard, Daimler, Alldays and Onions, Junior, Gnome, Clement-Talbot, Singer, De Dion, Durkopp, and Napier. The premises are specially equipped for this particular class of work, and the fact that they are in a position to give immediate attention to orders, in addition to being able to execute all repairs at short notice, is being greatly appreciated.

CLUBS AND ASSOCIATIONS.

THE MOTOR UNION.

OVER 800 hotels and repairers have received the recommendation and appointment of the Motor Union. The Touring Committee has issued 320 hotel signs and 220 repairers' signs embodying the badge of the M.U.

The Cheshire Automobile Club has contributed ten guineas and the South Wales and Monmouth Club two guineas to the Legal and Legislative Defence Fund of the Motor Union.

The twelfth provincial meeting of the Motor Union of Great Britain and Ireland will be held on Saturday, September 19th, at Oxford. At the meeting of the General Committee in the morning at the Municipal Buildings, the Union will be welcomed by the Mayor; and other events will be as follows:—2.30 to 3.0, meet of members, cars parked in St. Giles; 3.0 to 4.0, afternoon tea by the kind invitation of the Oxford and District A.C. in the Hall of Lincoln College; 3.30 to 6.0, members of the University will conduct members of the Union over the colleges and places of interest in Oxford; 7.0 for 7.15, twelfth provincial dinner at the Clarendon Hotel, Mr. W. Joynton-Hicks, M.P., in the chair. Application for tickets and hotel accommodation should be made to the hon. secretary, Oxford and District A.C., Clarendon Hotel, Oxford. Arrangements have been made to enable members and their friends to journey from Reading to Oxford by a launch, provided by Thursday, the 17th inst., a sufficient number inform the secretary, at 1, Albemarle Street, London, W., of their intention to journey by water. The launch will start from East's Boatyard, near Caversham Lock, Reading, at 11 a.m. on Friday, the 18th, reaching Oxford at 6 p.m.

On August 31st the total number of individual members of the Motor Union stood at 5,587, as against 4,273 on the same date last year, an increase of 1,314, or over 30 per cent. Including the affiliated clubs, the Union has a total membership of 15,000.

ESSEX MOTOR.

SUPPLEMENTING the reference to the Woodford-York-Woodford run of the Essex Motor Club in last week's *M.C.J.*, we would add that there were seventeen starters, of which three were on cars, the others being on motor-cycles. Messrs. Reynolds, Smith, Silverlock, W. H. Applebee, E. Leverett, Smith, Pratt, Dougal, Sproston, Howard, Brown, and J. Everett qualified for gold medals for completing the course within the twenty-four hours.

BROOKLANDS.

As the events set down to be run off at the Brooklands track to-day (Saturday) have not filled sufficiently to allow good races to be expected, the meeting has been abandoned, and all entries received for the same are cancelled.

The holiday season and the forthcoming Isle of Man race are the reasons assigned by Mr. Kenneth L. Skinner, the secretary, on behalf of the committee, for the deficiency in entries.

LANCASHIRE.

ON Saturday the members of the Lancashire A.C. held a gymkhana in a field near Stanley Grange, Hoghton. The results of the various competitions were as follows:—

Motor-house.—1, J. Robinson (51 sec.), 6-h.p. Siddeley; 2, Dr. Stephenson (1 min. 1 sec.), Midland car.

See-saw.—1, J. Walmsley (11 sec.), 12-h.p. Gladiator; 2, J. Hodson (12 sec.), 16-h.p. Bell.

Musical Chairs.—1, E. S. Berry (Daimler) and Miss Almond; 2, A. Murray (Coventry Humber) and Mrs. Murray.

Academy Stakes.—1, A. Birtwistle (Daimler) and Mrs. Walker; 2, J. Hodson (Bell) and Miss Kitty Crook.

Bending Race.—1, A. Birtwistle (Daimler); 2, A. Murray (Humber).

Doll-dressing Competition.—1, G. E. Baxter; 2, J. Dootson.

Blindfold Driving.—1, Dr. Stephenson; 2, A. Birtwistle.

Obstacle Race.—1, J. Robinson; 2, G. E. Baxter.

Royal Automobile Club's medal for best performance of the afternoon.—A. Birtwistle.

The club will hold a run to Windermere on Saturday, the 19th inst., and Mr. W. Birtwistle, J.P., has placed his two steam launches at the disposal of the members on that occasion.

NEWCASTLE.

THE Newcastle and District Motor Cycle Club held a non-stop run on August 30th to Jedburgh and back, a total distance of 108 miles. The result was: First prize—trophy given by Mr. G. W. Parkinson—Mr. Robson Crosier, 3½-h.p. N.S.U.; second prize—club silver medal—Mr. Thos. Smith, 3½-h.p. Triumph; 3rd prize—club enamelled medal—Mr. L. Rosenvinge, 3½-h.p. N.S.U. Bronze medals were awarded to the following riders who did non-stops:—Capt. Sir R. K. Arbuthnot, Bart., R.N., 3½-h.p. Triumph; S. W. Carty, 3½-h.p. N.S.U.; H. W. C. Bell, 4-h.p. N.S.U.; F. Mallett, 6-h.p. N.S.U.; F. Holzapfel, 4-h.p. C.I.E.; D. Mallett, 4-h.p. N.S.U.; A. Fenwick, 5-h.p. Vindeco Special; R. L. Atkinson, 3½-h.p. N.S.U.; G. S. Walker, 3-h.p. F.D.W.; W. H. Outwin, 3½-h.p. Triumph; W. F. Garbutt, 3½-h.p. Fafnir.

NORTHAMPTONSHIRE.

A MEETING of the committee of the Northamptonshire A.C. was held at Northampton on Wednesday of last week. Present: Mr. F. H. Thornton (chairman), Mr. A. F. Mulliner, Mr. Charles W. Phipps, Mr. S. Yarde, Dr. Lewis, Mr. Alfred Webb, and the hon. secretary (Mr. Sidney F. Harris). A letter from the County Surveyor respecting the repair of main roads was read and accepted. A letter from the Motor Union, enclosing correspondence between the Manchester A.C. and the M.U. in regard to the affiliation of the provincial clubs, was read. The committee, after very careful consideration, decided they were not in favour of any joint affiliation scheme, unless it was strongly supported by the R.A.C.—A letter from the Oxendon Rural District Council, in answer to one sent by the committee drawing attention to the want of direction posts in the village of Sibbertoft, was read, and it was resolved that a copy of the correspondence be sent to the clerk to the County Council, asking him to bring the matter before the proper committee, with a view to getting the necessary direction posts erected. The committee considered and approved the design for the combined badge of the R.A.C. Associates and the County Club, and gave instructions to the hon. secretary to order six. The committee expressed a wish that all members would have a badge when ready. Mr. Yarde laid a complaint about an official repairer, and Mr. C. W. Phipps made a suggestion about future legislation. Both matters were considered.

The following were elected members: Mrs. Campbell, Messrs. Abraham Allebone, Lewis Bradshaw, Geoff. Wood, W. Ryland D. Adkins, and William E. Wren.

The Motor Delivery Van recently built by the Canada Cycle and Motor Company, of Toronto, for the New Zealand Post Office Authorities.

KENT.

ON Saturday the members of the Kent A.C. were invited by the President, Sir David Salomons, Bart., to his residence, "Broomhill," Tunbridge Wells, an invitation which is always looked forward to with much pleasure. Among those present were the chairman, Mr. W. Willis, Mr. Alver, Capt. Page, the Rev. C. E. L. Wright and Mrs. Wright, Mr. and Mrs. T. L. Boyd, Mr. R. W. A. Brewer, Mr. and Mrs. Bradshaw, Mr. and Mrs. Brewerton, Col. Latter, Mr. G. Sutton, Mr. R. Wallace, Mr. and Mrs. Waddington, Mr. and Mrs. Wyllie, Mr. de Marney, Capt. Blunt, the Rev. A. B. Cotton, Mr. and Mrs. Spencer, Mr. and Mrs. Batchelor, Mr. Martingell, Mr. and Mrs. Woodward, Mr. and Mrs. Harvey, Mr. and Mrs. Stevens, and Mr. Booth Hearn.

SCOTTISH.

ON the 19th inst. the Scottish A.C. will hold a closed hill-climbing competition at Cairn o' Mount Hill, the entries for which close on Wednesday next 10 a.m. The hill is 3½ miles from Fettercairn, 1¼ from Brechin, 27¼ from Stonehaven, 43 from Blairgowrie, and 56¼ from Perth. It is 2 miles 35 yards in length, the gradients varying from 1 in 54 to 1 in 20. Competitors are advised to carry lunch on their car, and arrangements are being made with the Panmure Arms Hotel, Edzell, eight miles away, for tea being available at the close of the competition. Hotel accommodation for the evening prior to the hill-climb can be had at the Bay Hotel, Stonehaven, Commercial Hotel, Brechin, Queen's Hotel, Blairgowrie, and the Station Hotel, Perth.

A MEET of the Lincolnshire A.C. will be held at Revesby, by permission of the Hon. R. Stanhope, on the 17th inst.

MR. E. K. DAVIES (5-h.p. Peugeot) won the second mixed hill climb of the Southern Motor Club last week-end. Mr. S. Goodley was second on his 3½-h.p. Triumph.

THE CAUSE AND PREVENTION OF WEAR IN MOTOR-DRIVEN VEHICLES.*

By F. H. ROYCE.

THOSE who live in or visit London must have remarked the excessive noise of some motor vehicles now running on the streets of the Metropolis. This noise, it is evident, is largely caused by wear which should be as unnecessary as it is disastrous to the owner and to the motor movement. The personal experience of the writer has been rather of the private passenger motor-car than of public and commercial vehicles, and it is hoped that the cause of, and remedies for, wear in the luxury motor carriage may be regarded, at least, as interesting. The subject may be dealt with under three headings:—1. Design. 2. Material and Workmanship. 3. Lubrication and Attention. To obtain the best results, the conditions must be favourable under all three headings.

It is extremely difficult to deal with questions of design without showing a large number of illustrations, but the following are a few examples of practices in motor design which are worthy of special attention. One observes that in such important features as connecting rods, shafts in change gear-boxes, road wheels, wheels running on studs, the bearings are so disposed that the load or pressure, 1, does not fall in the centre of the length or bearing; 2, or in the case of two rows of ball bearings, does not fall between the two bearings; 3, or worse still, falls beyond and quite outside the bearing.

Absence of regard for the mechanical canon that pressure should either be centralised on or equally distributed along the whole length of a bearing is undoubtedly the cause of wear in many motor-cars.

Road and other stresses cause twistings and deflections which may throw out of alignment various parts. Take, for instance, a comparatively rigid crank chamber fixed to the frame. The frame, owing to road irregularities, twists, and its side members thus act as powerful levers tending either to break the attachments or twist the whole crank chamber. In the latter case, the bearings of the crankshaft become deflected from true axial alignment, causing excessive load to fall on small areas. Rapid wear, if nothing worse, must result. At various points throughout the chassis similar departures from true alignment caused by various stresses must be anticipated, and should be provided for as far as possible. Again, there are crankshafts which have evidently insufficient support, such as double cranks with no bearing between them. In these cases, again, we have the distressing knowledge of crank pins bent out of true alignment. Excess of pressure on local spots, and the crushing out of lubricants at such spots, must be attendant under these conditions, and more or less rapid wear must result. Another instance of improper deflection is found in cars in which the torque rod, used to control the back axle, is so fixed that no provision is made to allow of the movement which must take place when one back wheel rises higher than the other owing to its surmounting an obstruction on the road, or owing to an uneven road surface. In such a case some slack must exist in the joints or the part must bend.

Another point that may be mentioned in connection with design is the importance of arranging that parts which are subject to much friction (such as gears, road wheel bearings and universal joints), should not only be fitted with oil-retaining devices, but also thoroughly protected against mud and water. One sees universal joints on quite a number of expensive chassis which are not provided with any case at all, or perhaps provided with cases which cannot retain oil against the high centrifugal

force engendered. It is hard to imagine the lubrication staying on a joint revolving at from 300 to 1,500 revs. per minute, if it has the slightest chance to escape.

The choice of materials used in the construction of a motor vehicle are chiefly important for two reasons:—1, To avoid breakage. 2, To resist wear. If the film of lubrication could be perfectly maintained, the material used for the wearing surface would be quite unimportant. In almost every main part of a car the wear is taken on ball bearings, or the parts are capable of being case-hardened. Ball bearings carefully arranged and well made are wonderful things, carrying enormous weights and bearing considerable ill-treatment, but the materials for these deserve careful selecting. It is worth while to state that these ball-bearings should, in all cases, be in oil-retaining boxes and be thoroughly protected from water, their most deadly enemy.

The system of automatic lubrication is a matter of design, but automatic and hand lubrication are herein dealt with under the one common heading of "lubrication."

Engine Lubrication.—"Splash" lubrication of the engine, which formerly was the common practice, had two main objections—Firstly, it was difficult to maintain exactly the correct level of oil in the crank-chamber; and secondly, the extent to which the oil arrived between the surfaces of the bearings and remained there was uncertain and imperfect.

It has been found better, therefore, to adopt the forced system of engine lubrication which is used in high-speed steam engine practice, for the following reasons:—1. More perfect lubrication.—So perfect and consistent is the film of oil maintained by this system that there have been cases in which the connecting rod bearings have, apparently, never touched the crank pins, since the latter have shown throughout their surface a bronze colour undisturbed by sign of wear or polish. 2. It is better that the oiling shall be constant and out of the control of the driver. Under this system the engine is always sufficiently lubricated, and never over-lubricated. The lubrication is not dependent, as in the case of splash oiling, on whether the last 5 per cent. of oil is or is not put into the crank chamber.

The lubrication of parts of the car other than the engine is, as a rule, dreadfully neglected. To oil the joints, &c., situated under a car is a dirty job which does not appear to recommend itself to most chauffeurs. Those who have been coachmen dread lubrication lest the car should look greasy or oily; but if these men could only realise the havoc which is played with their master's property by want of lubrication, they would—for they are, as a class, excellent, honest and painstaking—make it a rule to get into a suit of overalls, lubricate every part, and end up by cleaning off surplus oil, thus satisfying their cleanly instincts. Next, let a warning note be sounded as to what kind of oil to use. This can be roughly outlined as follows:—(1) Do not use thin oil. (2) Do not use stiff grease. (3) Use oil of ample viscosity (body), and of good lubricating properties. And lastly (4) Use the very thickest oil, that will always be liquid, for all parts except the engine. In summing up, it seems to be of the utmost importance that the designer should provide—1st. Satisfactory (and, as far as possible, automatic) means of lubrication. 2nd. Ample or thoroughly case-hardened surfaces. 3rd. Protection against mud and water.

* Abstract of paper read before the Dublin meeting of the British Association.

ROAD REPORTS.

LICHFIELD.—The clerk submitted letters from Mr. Moncur, the Chief County Surveyor of Main Roads, with reference to the proposal to erect signposts for motorists. Three of the 'signposts' would be on the county main roads, and two on roads over which the Lichfield Rural District Council had jurisdiction.

EAST GRINSTEAD.—Several improvements to the approaches to the town of East Grinstead are now being carried out, among which is the making of a new road leading from Cranston Road to the bottom of Blackwell Hollow. Widening is also being carried out at West Street and Danning's Mill Road, which are the outlets to Turner's Hill and West Hoathly, respectively.

GLAMORGAN.—The Aberavon Town Council is asking the Glamorgan County Council to secure the limitation of the speed of automobiles within a certain distance of any town; application is also being made to the same body by the Briton Ferry District Council for the imposition of the ten mile per hour limit on cars passing through Briton Ferry.

NEWHAVEN.—At the meeting of the Newhaven Rural District Council the surveyor submitted a special report on the substitution of rag stone for flints on roads subject to motor traffic, and asked for an additional 135 tons of Kentish rag. He added that it was now found that Kent rag was a good binding material, and where a section of flints had been covered with rag the road had not broken up so much in the dry weather. The rag did not, however, wear well in the winter and in wet places.

CHESHIRE.—At the meeting of the Chester Rural District Council at Chester on Saturday the Clerk read, amid laughter, a letter from the Cheshire County Council offering to undertake dust laying on the main

roads if the Rural Council contributed two-thirds of the cost. It was decided to take no action with regard to the County Council's letters.

SHOREHAM.—Warning notices to motorists are to be placed on the lamp-posts at Shoreham.

WATFORD.—An order has been made by the Local Government Board approving certain regulations made by the Hertfordshire County Council under the Motor Car Act. Their effect is to establish a speed limit of ten miles an hour within certain specified portions of the urban district of Watford, to come into force on the 21st inst.

COMPANY NEWS.

(In the case of New Companies the file number is given at the end of the particulars.)

VICTORIA GARAGE AND ELECTRICAL COMPANY.—£1,500. To acquire the business carried on at St. John Street and Parkside, Coventry, as Victoria Garage and Electrical Company, and business carried on at 27, Fleet Street, Coventry, as Stour Cycle and Motor Depot. Private. 68, John Street, Coventry. (99,389.)

MOTOR SALES, LTD., has been registered with a capital of £100 and offices at 334-6, Euston Road, London, N.W.

THE Pychley Autocar Company, of Market Harborough, have adopted the H.F. jointless joiner in connection with the vulcanising of motor tyres, as have also Messrs. H. C. Reading and Co., Ltd., High Street, Burton-on-Trent, and Mr. T. Alger, Widmore Gardens, Chislehurst Road, Bromley, Kent.

CASES AGAINST MOTORISTS.

"HOLDING UP" A MOTOR-CAR.

At Wigton (Cumberland) Edward Thompson, of Thursby, has been summoned for obstructing the free passage of the highway by placing himself in front of a motor-car and refusing to move. Mr. Westmorland, for the defence, pleaded that motor-cars were a nuisance to anyone who was not riding in them, and as a great many passed this particular place at great speed and created much dust, the defendant became greatly irritated, and cried, "I'll stop the next car," and did so. The magistrates' clerk said he understood that the defendant sat by the roadside a good deal—a foolish place to sit nowadays. The defendant had already paid £1 19s. damages to the car caused by his breaking the glass screen, and he was now fined 10s. and costs.

ON THE TOWPATH.

At the instance of the Thames Conservancy fifteen persons have been summoned on one day at Kingston-on-Thames, for either motoring or driving horsed vehicles along the towpath between Hampton Ferry and Molesey Lock. Fines of 5s. and 8s. 6d. costs were imposed on each of the defendants, the magistrate remarking that these were the first cases under the recent Thames bye-laws prohibiting vehicular traffic from the towpath in question.

TEN PREVIOUS CONVICTIONS.

At the Petty Sessions at Windsor on Saturday, Thomas Sopwith was summoned for driving his motor-car beyond the legal speed limit at Old Windsor on August 12th, and on a second summons for failing to produce his licence at the request of the police officer. He should have appeared before the Bench a fortnight previously, when he sent a letter of excuse, which the magistrates declined to accept, and ordered his attendance. The evidence of a police-sergeant was to the effect that he drove over a measured quarter of a mile in 34 sec., equivalent to 26½ miles an hour. When stopped he did not deny it, and when asked for his licence said he had not got one. Defendant said that what he told the officer was that he did not know his licence had expired, and when he returned to London he took out a new one. Asked by the magistrates' clerk to produce it, he said he had not got it, and there was no law to compel him to bring it to a police court. A list of ten previous convictions in different parts of the country for offences under the Motor Car Act was produced to the Bench. The Chairman, in giving the decision of the Bench, said they fined him £25 and costs, ordering him to appear before them at the next court with his licence to be endorsed.

BRIEFLY RECORDED.

On Tuesday a motorist was fined £2 at Hove for dangerous driving; six were convicted at the Steyning Petty Sessions, the aggregate fines being £39; and three fines at Arundel totalled £17.

Harrogate (10, each fined £1 and costs), Rollesby, Truro, (2), Chelmsford (9), Havant (9), Barwick (3), Forfar (4), Rugby (3), Leeds (2), Carnarvon, Abergale, Horsham (4), Chelmsford, Kirkham (4), Wetherby (12), Christchurch (20), Lincoln, Kesteven Petty Sessions (3), St. Neots (6), Carlisle, Woking (4), Guildford (9 cases, the aggregate fines being £81), Shepton Mallet (3), Dover (2), Basingstoke (5), Ormskirk, Petworth (5), Bridlington (2), York and Newcastle-on-Tyne (2).

EXCEEDING 10 M.P.H.

At the Spelthorne Sessions on Monday, R. S. Elliott, chauffeur to Sir Philip Watts, Director of Naval Construction, was fined £3 and costs for having exceeded the ten miles an hour speed limit at Chesnut Avenue, Bushey Park. Two parkkeepers, who timed the car with stop-watches, alleged that the defendant's pace was over twenty-one miles an hour. For the defence, it was alleged that the car was incapable of a speed of twenty miles an hour, and Lady Watts, who was in the car at the time, offered to hand the car over to any of the justices if they could get a speed of twenty-one miles an hour out of it, saying that the parkkeepers' watches showed a difference of a minute and a half in the timing.

ALLEGED ROAD RACING.

At the Kingston County Police Court, Mr. E. B. Toms, aged 22, gentleman, of North Haven Point, Parkstone, Dorset, was charged by the police with wantonly and furiously driving a motor-car in the Portsmouth road, Long Ditton, and knocking down Alfred Berry, of Surbiton, thereby causing him grievous bodily harm, on Thursday of last week. Evidence was given by five witnesses, whose testimony was to the effect that two motor-cars, one of which was driven by the accused, were travelling along the Portsmouth road in the direction of Ditton, at the rate of between thirty and forty miles an hour. The man Berry had charge of a horse and cart which was going in the same direction, and had crossed the road to pick up his coat, which had dropped from the cart. As he was returning to the cart, he was caught by the accused's motor-car, dragged for some distance, and finally run over. Mr. Patrick Shaw, solicitor for the defence, reserved his cross-examination of witnesses, but stated that the accused had been an owner and driver of motor-cars for six years, and had never had a summons, an endorsement of his licence, or an accident until now. The magistrates remanded the accused for a week, but accepted bail, the accused in £100, and one surety for a like amount.

INLAND REVENUE.

E. E. James, a motor engineer, of High Road, Leytonstone, was summoned at East Ham on Tuesday for keeping a motor-car without a licence. Mr. Finch, an Inland Revenue officer, said that on June 6th he

saw the defendant in Plashet Grove, East Ham, driving a motor-car numbered "H 545." No licence had been taken out, and the defendant, when spoken to, said that he only used the car for business purposes. The defendant did not appear, and a fine of £4 4s. and costs was imposed by Mr. Grubbe, who suggested that when the money was paid the Revenue should send a licence to the defendant.

POLICE "CONTROLS."

It is rumoured in the locality that the police of East Sussex have suspended their long-distance timing operations.

The police are frequently timing motorists over several five mile stretches in Aberdeenshire.

SEVERAL motorists have lately been charged for exceeding the speed limit between Braemar and Crathie, in Aberdeenshire, and one who pleaded guilty added that he did not know he was exceeding the limit; all that he was aware of was that "he got tired of racing the traction engines."

At the Buck Barn cross-roads, near Horsham, the police are showing great activity against motorists.

The New London Road, Chelmsford, has its police trap worked by constables armed with stop watches.

AMONG the Scotch traps in frequent operation are those between Forfar and Brechin—the timing being between the milestones, principally the fourth and fifth from the former place.

IN Lincolnshire the Long Bennington and Great Gonerby traps have been working frequently of late as well as the three miles stretch between Great Poulton and Colsterworth.

THE Chapel-en-le-Frith District Council is complaining to the police of the excessive speed at which motor-cars pass through the district.

POLICE traps are frequently worked at Rugby, on the road leading to the Polo Ground, and in the parish of Stretton-on-Dunsmore.

The Argyll Three-Ton Motor Lorry recently supplied to the Dominion Bridge Company, Lachine, Que., by the Dominion Motor-Car Company, Ltd., Montreal.

YORKSHIRE now has several "controls," including one on the Menston road near Otley, the Harrogate road at Moortown, near Leeds, on Prospect Hill and Parliament Street, Harrogate—where the police look for those who exceed the ten mile limit.

KENTISH traps include those on the Dover-Canterbury road, between Bishopsbourne and Barham.

SEVERAL motorists have lately been trapped at Greenbottom, near Truro.

MOTOR CYCLING.

THREE motor-cycle matches and a record attempt were held at the Stadium at the Franco-British Exhibition on Saturday. In the attempt on record, C. R. Collier, on a Matchless machine, covered a mile in 1 min. 2 4-5 sec., which was one-fifth second faster than the previous best for the track. The first of the matches was over one mile with a flying start, and Collier beat H. Martin, on another Matchless machine, by 30 lengths in 1 min. 10 sec. The second encounter, over three miles from a standing start, went to Martin in 3 min. 55 sec., and a deciding contest of five miles from a flying start resulted in favour of Collier by 10 yards after a good race, in 6 min. 59 3-5 sec.

HUMBER, LTD., have just given delivery of a 10-12-h.p. Coventry Humber car to the special order of a medical man. The body presents many interesting features, as it can be used as a two or four seater at option. The rear seating accommodation can be slipped off expeditiously by means of two snap locks, and a neat box 42 in. long, 34 in. wide and 6 in. deep, for spares, &c., can be substituted. A victoria hood can be fitted over front and rear seats as desired. Legs are provided for the detachable portion of the body to facilitate handling when off the car. This type of body should be eminently suited for those who wish to use their cars for both pleasure and business purposes.

FORTHCOMING EVENTS.

SEPTEMBER.

- 12th (Sat.).—Bristol and Gloucestershire A.C. gymkhana at Badminton Park.
Motor Cycling Club's petrol consumption test, starting from Gerrard's Cross.
Yorkshire A.C. closed hill climb at Pateley Bridge.
- 13th (Sun.).—Mont Ventoux hill climb of the A.C. Vaulxaisien.
- 14th-26th.—International Rubber and Allied Trades' Exhibition at Olympia, London.
- 16th (W.).—Entries close at noon for the "Graphic" and "Henry Edmunds" Trophies.
- 17th (Th.).—Touring car competition of the A.C. of Holland through that country.
Nottinghamshire A.C.'s cripples' outing to Costock.
- 19th (Sat.).—Provincial meet of the Motor Union at Oxford.
Sheffield and District A.C. hill climb at Padley Wood, Grindleford.
North Middlesex A.C. 100 miles reliability run.
Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
Lunch of the Kent A.C. at Dover.
L.G.B. inquiry into application of the Bangor Town Council for a restriction of motor-car speed.
Lancashire A.C. closed speed trials.
- 22nd (Tues.).—A.C.U. International Auto-cycle Tourist Trophy Race, Isle of Man.
Last Practice Day for Isle of Man Race; weighing of competing cars, 10.30 a.m.
- 23rd (W.).—"Graphic" Trophy (10 a.m.) and "Henry Edmunds" Competitions (2.30 p.m.) in the Isle of Man.
- 24th (Th.).—The "Four Inch" Race in the Isle of Man.
- 25th (F.).—Welsh A.C. reliability trial for motor-cycles.
- 26th (Sat.).—N.W. London M.C.C. petrol quantity judging competition.
Invitation to the Kent A.C. by Mr. and Mrs. Schlentheim to Chislehurst.
Examination for R.A.C.'s driving certificates at the Adelphi Hotel, Liverpool.
- 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

LIGHTING-UP TIMES—LONDON.

| | | | | | | |
|----------------|----|-----------|----|-----------|----|----------|
| Sep. 12th—7.21 | .. | 14th—7.17 | .. | 16th—7.12 | .. | 18th—7.7 |
| " 13th—7.19 | .. | 15th—7.14 | .. | 17th—7.9 | .. | 19th—7.5 |

To find the approximate lighting-up time in September for Birmingham 9 minutes should be added to the above times, 8 for York, 13 for Manchester, and 25 for Glasgow.

AUTOMOBILE ACCIDENTS.

A SERIOUS automobile accident occurred on Thursday week near Allendale, Newcastle-on-Tyne. Mr. F. Stewart, of Newcastle, was driving a party from the latter place to Allendale when the car skidded in taking a corner. It crashed through the hedge and rolled down the embankment on the other side, finally overturning into the stream, fifteen yards below. The party was precipitated into the water, and several received serious injuries.

A MOTORIST named C. W. Ripley, Coundon Street, Coventry, died on Saturday from injuries received the previous night in a collision. He was driving from Rugby to Coventry, and on reaching Binley Bridge his car collided with a stray horse. Later he was found by a farmer, and removed to his home.

To avoid running into a pack of fox-hounds at Caxton, Cambridgeshire, Mr. A. C. MacLaren, the cricketer, brought his motor-car into collision with a roadside bank. The car was overturned, and one of Mr. MacLaren's legs was pinned underneath, but the injury is not serious.

MR. AND MRS. WALTER TIMSON, of Barnes, were on Sunday night returning with their family in two motor-cars from their holidays at Bognor, when, on reaching Slindon Woods, the steering gear of the second car went wrong, with the result that the vehicle dashed into a stone wall surrounding the Duke of Norfolk's park. The occupants were thrown out, and Mrs. Timson was severely injured, while a boy had his arm broken in two places.

THE coroner for South Northumberland on Wednesday investigated the circumstances attending the death of Mr. John T. Coxon, contractor, residing at Holywell village, who on Tuesday succumbed to injuries received in a collision between the motor-cycle which he was riding and a motor-car on Monday.

ARTHUR LAMB, aged seven, was playing in the road at Ombersley, near Worcester, on Tuesday, when he ran in front of a motor-car. Despite the efforts of the driver and the warning shouts of his school-mates, he was knocked down and killed.

THE "Challenge" oils and greases of Messrs. Mosbuis and Son, of the Howard Works, Stoke Newington, are recommended by many motorists.

PUBLIC SERVICE.

SHOREHAM.—The Shoreham Urban District Council have granted licences to five motor vehicles and ten drivers to ply for hire in the district.

BUSINESS NEWS.

THE Shrewsbury and Challiner Tyre Co., Ltd., of Ardwick Green, Manchester, have sent us a copy of the new catalogue they have just issued, giving full particulars and illustrations of Challiner's patent detachable rim, which is steadily increasing in popularity, as may be judged from the fact that the output during the first half of the current year showed an increase of over 400 per cent. on the corresponding period of 1907. The rim can be used with wheels of either the artillery or wire-spoked type. Included in the list are particulars of a handy tool to hold the rims when changing the tyres in the garage.

In order to avoid any misunderstanding amongst their agents, Ariel Motors, Ltd., are desirous of arranging terms and districts for 1909 during September and October. It is the intention of their representative, Mr. P. R. Lamb, to call and discuss their next year's programme with all interested agents with a view to fixing matters up before the Olympia Show.

MOTORISTS will be interested in the new "Jaeger" price list of raiment especially useful in the colder days that are coming upon us. The company's headquarters are at 95, Milton Street, London, E.C.

MESSRS. JOSEPH OWEN AND SONS, LTD., of Liverpool and London, will this season have regular shipments of ash logs, their first cargo being due next month. This special ash of straight grain, tough and fine texture, is well known to many of the leading motor-car body builders, and intending purchasers would do well to communicate early with the importers, as, on account of the great scarcity, the ash will come to a good market.

We learn that Mr. C. F. Bertelli has resigned his position as managing director of the Junior and O.T.A.V. Cars Co., Ltd., and that from this time onwards Mr. E. E. Leverett will be responsible for the direction of the business.

THE Daimler Company have recently sent quite a large number of cars to customers abroad. On one day last week nine cars left the works, six for Messrs. Dalgety and Co., their Australian agents, one each for their agents in New Zealand and Portugal respectively, and the other to India for His Highness the Maharajah of Nepal. The latter is a very handsome car of the Blackdown landaulet type, and is painted red with black mouldings and lined gold. The upholstery is in red leather to match. The Daimler Company have also just supplied a 48-h.p. rugby phaeton to the India Office, and have received an order through the Bombay Motor-car Company for a Stoneleigh limousine for the Rajah of Padma.

THE Birmingham Small Arms Company, Ltd., Birmingham, have sent us a copy of the catalogue of the B.S.A. motor-cars they have just issued. This gives full particulars of the two models—18-23-h.p. and 25-33-h.p.—on which attention is being centred, the description being amplified by illustrations of the principal parts of the chassis. The name B.S.A. is a household one in the cycle world, and, judging from the list before us, no efforts are being spared to produce vehicles which shall earn for themselves an equally high reputation in motoring circles.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, SEPTEMBER 19, 1908.

[No. 498.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

AFTER an exhaustive examination of the photographs in conjunction with the notes taken on the occasion of their trials on the Brooklands track, the Dust Committee of the R.A.C. has now made its awards in connection with the trials held in July last. For the Inter-club Competition for teams of two cars each, the West Surrey A.C. was placed first, with the Kent Club in the second place. The competition for petrol cars entered by manufacturers as standard vehicles has resulted in the first position being awarded to the 22.5-h.p. Buick entered by Mr. Frank Eason. The second award was obtained by the 18-h.p. two-cylinder Reo of Mr. H. Gordon Sharp. The next three cars to be placed were the 35-h.p. Dennis, the 18-h.p. Alldays, and the 10-h.p. Cadillac. Steam cars were, this year, not run for competition, but a Stanley vehicle was located between the second and third of the petrol competitors at twenty miles per hour and classed as equal to second place at thirty miles per hour. The awards in connection with the experimental class are still under consideration, and we must await the full report of the committee for their detailed criticisms of the various classes in the competition.

London and its Cabs.

THAT the police of the metropolis are watching with some degree of sympathy the rapid development of the motor-cab in London is evident from the promptness with which they have recognised its growing popularity. Hitherto it has been found difficult to prevent three persons from attempting to sit in the space licensed to carry two, and many times have the police vainly attempted to prevent such overloading. Realising its effect they have issued amended rules and regulations with a new table of fares authorising the collection of 6d. per head for adults for each passenger over two in a cab licensed to carry four persons—in addition to the amount of that recorded by the taximeter. The General Motor Cab Company has, by making an addition of less than half a cwt. to the weight of the car, been able to provide a motor-cab to carry four persons, giving them the dimensions required by the police regulations. These new cabs will be of the present landaulet pattern. Whilst it is likely a good many of the quartette-party cabs will be placed on the streets, we do not anticipate that the two-seated vehicles will entirely disappear. After all, two persons are probably the average number of passengers carried by the London cab, and the two-seated vehicle is not without points in its favour.

Lull in the Newspaper Tirade.

LAST week we were able to refer to the action proposed to be taken by the Royal A.C. with regard to the establishment of machinery for dealing with inconsiderate driving. The proposals then outlined have been communicated to the general Press, and apparently have met with considerable endorsement from those who have given any thought to the subject. We are glad to notice something of a lull in the outpourings of the

ordinary newspaper correspondents, and doubtless, now that the busier season of the year is coming upon them, they will find less to write in relation to motorists and those who make good use of the public highways of the country.

Rubber.

MOTORISTS are so greatly interested in rubber that the Exhibition now open at Olympia, London, is likely to be visited by many of their number ere its close. In fact, we noticed several well-known "knights of the wheel" critically inspecting the exhibits one day this week. Col. W. J. Bosworth is chairman of the Exhibition, and several familiar names occur among the Advisory Committee. Although india-rubber was observed in the island of Haiti during the second voyage of Columbus, it was not really introduced into France until 1735, its advent to our English shores being of later date. Eighty years ago less than twenty-four tons were imported into this country; last year, we are reminded by Sir Henry A. Blake, G.C.M.G., the import had reached 33,364 tons, and so many new avenues for its employment are being opened that there is no restricted limit to the business to be done.

Vulcanization.

IN this connection we may call attention to an article by Mr. William Frost on the Universal Value of Vulcanization, which forms one of the series of useful chapters with which the catalogue of the Exhibition is prefaced. Mr. Frost boldly claims that vulcanization is responsible for the development of the industry, and compares it with the tempering process in connection with metals. Perhaps the most conspicuous example of the commerce-creating character of vulcanization is seen in the business in motor tyre repairs which has been built up in this country. Already this has attained large proportions; and the end is not yet.

Restriction to 15 m.p.h.

AT one of the last sittings of the Trade Union Congress at Nottingham, a representative of the London Carmen's Union proposed the following resolution, which was adopted:—"That this Congress views with great alarm the ever-increasing number of accidents and deaths among the general public caused through the excessive speed and callous driving of motorists, and instructs its Parliamentary Committee to use every means in its power to get legislation so amended as to restrict the speed gear of motors to a maximum of fifteen miles per hour, and in instances of heavier vehicles the speed gear be fixed at a less degree in proportion to the weight of the vehicles." On the same day that such motion was adopted at Nottingham, the unemployed at Glasgow were being urged to agitate for a national system of roads, in order to find work for their number. The two incidents do not count for much even when added together. But they are typical of the way in which many people idly talk of motor-car matters and are prone to denounce the automobile without consideration of the circumstances of the position. To restrict the speed to fifteen miles per hour is suggestive of the old-time antipathy of the workmen to machinery

of any kind—a view that we had hoped had been outlived by the generation of to-day. Fortunately the resolution of the London Carmen is not likely to find favour with Mr. John Burns, who has already declared against the principle involved in such a suggestion.

Development in Motor Design.

It is probably safe to say that not since the advent of the modern motor-car has such a notable innovation been made in any feature of its construction as that which is chronicled elsewhere in the present issue. We refer to the new engine which is being adopted by the Daimler Motor Company, Ltd., the striking feature of which, while it works on the ordinary four-cycle system, is its absolute freedom from valves, springs and cams, and small parts. For a concern of the standing of the Daimler Company to make such a startling departure, with the full knowledge of the effect of an error of judgment in this direction, is sufficient evidence that the new motor must possess great merit.

Touring in Germany.—The Entrance to the Hagenbeck Zoological Garden, Hamburg.

Haslemere and the A.A.

THE Haslemere Parish Council having asked the A.A. as to the reasons for placing a motor scout at the cross roads in the village on Sundays, have received a reply from the organisation in Princes' Street, London, W., wherein it is stated that the duties of the patrol are "to restrain the speed of all motor-cars entering Haslemere." Mr. Cooke points out that in many places his Association is working in conjunction with the police "to such an extent that the control of the motor traffic is left almost entirely in our hands," so that the only thing now to be done is for the Parish Council of Haslemere to thank the Association for the good work it is doing.

Speedometers.

THE advice that the President of the R.A.C. recently gave with regard to the use of speedometers by motorists has received magisterial endorsement in the North London Police Court. Two drivers of motor-buses were summoned to that Bench for driving at a greater speed than twelve miles an hour. In defence, each urged that the difference between the legal limit for such vehicles and the fourteen miles per hour

which the police alleged they had driven was such a narrow margin that it was impossible to gauge with exactitude without the use of speedometers. Thereupon the magistrate directed the police authorities to communicate with the owners of the vehicles suggesting the provision of speed indicators. The subject has certainly become one of great importance to motorists, who will doubtless be interested in the further notes on the merits of various devices which we publish on another page.

Commercial Vehicles in Glasgow.

A PARADE of commercial motor vehicles is to be held at Glasgow on the 5th prox. under the auspices of the Commercial Vehicles Department of the Scottish A.C. Manufacturers and dealers as well as owners of motor vehicles who have acquired the same since January 1st, 1903, are invited to send vehicles, but these will not be eligible for competition in the prize scheme. Vehicles which had been in use prior to that date will be divided into four competition classes, the prizes being awarded on the basis of condition and appearance. The categories will be (1) vehicles constructed for carrying loads of one ton and under; (2) those between one ton but not more than 35 cwt.; (3) vehicles driven by internal combustion engines constructed to carry loads greater than 35 cwt.; and (4) steam vehicles. The number of firms north of the Tweed that have adopted mechanical traction in their delivery work is so large that a great display should be seen in the city of St. Mungo on the occasion of the parade.

Police Evidence.

AT Marlborough Street (London) Court, the other day, Mr. Meade, the magistrate, dismissed a case in which he was dissatisfied with the manner in which the notes of the policemen were made. The solicitor representing the Commissioner of Police said that it was obvious the notes were made in collaboration, although there was a regulation that police officers should make their reports independently of each other. The point is one of special importance to motorists, who have always protested against such collaboration, which has conducted to much bad feeling in many districts of the South of England. Surely the authorities should insist that the records of police officers should be made quite independently of each other, to avoid all suspicion of collusion.

The Canine Race.

RECOGNISING the fact that dogs are a frequent source of danger to motorists, our readers will be interested to learn that last year 1,640,017 dog licences were taken out in England alone. This is an increase over the previous twelve months of 30,586, and nearly 400,000 as compared with the last decennial period. It would appear that the suggestion made in the early years of the automobile, that it would lead to the destruction of the canine race, has been falsified. Instead, it may be stated that during the last ten years in which the motor-car has flourished the number of dogs in the country has multiplied to a great extent.

A Scottish Census.

DURING the first fifteen days and nights of August the Surveyor to the Elgin County Council, in conjunction with the Badenoch District Committee, carried out a count of the motor traffic at Fochabers Bridge, Findhorn Bridge, and Dulnain Bridge. Over the first there passed 455 automobiles, eighty-one of which were Elgin cars, 143 were registered in other counties in Scotland and England, eighty-three in burghs in Scotland, twenty-eight in burghs in England and Wales, and 118 in London. Similarly over the other two points there passed 127 and ninety-three of London registered cars respectively. Speaking generally of the automobile traffic in the district 15 per

cent. was of cars registered in Elgin, 20 per cent. of cars belonging to the northern counties of Scotland, 41 per cent. English cars, half of which came from London, and the remainder from other Scottish districts. Since the beginning of the current year to the end of August 3,147 cars passed over the Findhorn Bridge, proof of the growth of the automobile movement.

**Stands Scotland
where it did?
Yes.**

◆ ◆ ◆
In our issue of the 15th ult., under the questioning heading "Stands Scotland where it did?" we referred to the way in which the members of the Scottish Motor Trade Association were asserting their rights in connection with the exhibition at Edinburgh, which has long formed a part of their annual programme. We then wrote that their position was "perfectly consistent and they can be trusted not to be overawed by the menaces of a southern body." That we were well justified in such belief is now being proved by the decision of the Society

Mr. Eggar to make his remarks in peace, for we do not hear of any comments made thereon. All that happened was that it was resolved to ask the Local Government Board to grant no order in regard to the speed of motor-cars whilst passing through Farnham without holding a local inquiry to enable the Council to express their views.

**New Petrol Motor
Fire Engine.**

◆ ◆ ◆
ON Wednesday last Messrs. Dennis Bros., Ltd., invited a number of members of the Press to a demonstration at Weybridge of their new petrol motor fire-engine. The machine is fitted with a 40-h.p. four-cylinder engine, which is utilised both for propelling the vehicle and for driving the pump. The latter is of the Gwynne-Sargeant turbine type, running at a normal speed of 1,700 revolutions per min. A 5 in. suction hose is employed, the water being admitted to the vane chamber on both sides. The power of the engine is more than ample for a

Practising for the "Four-Inch" Race in the Isle of Man.—One of the Cars at Hillberry Corner.

◆ ◆ ◆
of Motor Manufacturers and Traders not only to withdraw their previous prohibition of the event, but to approve of the Show, which it is proposed to hold at Edinburgh at the beginning of next year on the same lines as formerly.

**The Turnpike
again.**

◆ ◆ ◆
THE persistency with which some of the members of the rural district councils continue to advocate the imposition of tolls in connection with motorists is really amusing. The other day, at the meeting of the Farnham Council, Mr. J. A. Eggar urged that they should return to the use of the old turnpike gates, restricting the payment of tolls, however, to motorists. He suggested that the gates should be placed at the extremities of the town, and that telephonic communication should be established between them, so that those vehicles which travelled too fast could be detained. Fortunately, however, the other members of the Council seem to have allowed

delivery of 450 gallons per minute from two deliveries of $\frac{3}{4}$ in. to $\frac{7}{8}$ in. with 120 ft. jets, or a single 2 in. jet of 210 ft. A small pump tank is carried, which supplies the pump with water until the suction is at work. As soon as the pump is thrown into gear with the engine, water is sprayed at high pressure from the tank past the ejector nozzle leading from the suction pipe. The air is extracted almost immediately from the suction lift, with the result that as soon as the suction strainer and basket are inserted in a dam or stream the deliveries commence. Muddy water or sand do not interfere with the delivery as there are no valves to clog. The transmission system from the engine to the pump is exceedingly simple; over and geared to the clutch shaft driving the change-speed gear is another shaft which has no connection whatever with the gear-box. Normally the pump shaft is not in mesh with the clutch shaft; as soon as the vehicle stops at a fire a small lever is pulled over and the pump shaft is put into mesh with the clutch shaft, still being driven from the engine.

The New Daimler Engine.

A STRIKING DEPARTURE.

WIDESPREAD interest has been aroused by the announcement by the Daimler Company of its sweeping motor innovation for 1909, a brief reference to which was made in the last issue of the *M.C.J.* For the first time since the noted engineer from whom this company derives its title gave to the world the present type of high-speed engine which has made the success of the motor-car possible, has there been a noteworthy change from the original design. In fact, the original Daimler type of motor has been copied and adopted throughout the motor world to an extent which has caused it to be looked upon as almost the last word in internal combustion motor construction. The original poppet valves with their springs have almost come to be accepted as a necessary evil, and efforts to eradicate them from the high-speed four-stroke model have hitherto met with little success. The impracticability of the original Otto slide valve has been accepted as a just condemnation of the application of all devices of the kind to motors working under extreme temperatures, and improvements which have been effected in petrol engines for use on motor-cars have been directed more to refinements than to radical changes. Hence it may readily be imagined that the news of a firm with the high standing and reputation the Daimler Company enjoys for conservatism having absolutely discarded the ordinary type of inlet and exhaust valves, with their accessory cam shafts, tappets, springs, &c., and, after more than two years of the most exhaustive investigation and severe tests, deciding to stake their reputation upon an entirely new design of engine, is of more than passing interest.

The motor in question which works on the ordinary four-cycle system is of American origin, its designer having

Company working in conjunction with its engineering and mechanical departments to the end of perfecting the design and adapting it to the requirements on this side. The result of all this work is seen in a motor which the Daimler Company believe

Fig. 2.—The Sliding Sleeves shown detached and mounted one over the other as they are fixed in the cylinder.

to be the nearest to perfection of any power-producing mechanism so far produced. The engine is described as being incredibly smooth and noiseless, plain and simple in construction, economical in operation, and so designed as to almost eradicate the element of mechanical troubles. Briefly summarised, the main feature of the new motor is the substitution of the ordinary poppet or mushroom valves and their adjuncts by cast iron tubes or sleeves (Fig. 2) used as a lining of the cylinder, containing ports which register with one another at desired intervals, being actuated by eccentrics coupled up with miniature connecting rods. The result is a remarkable combination tending toward theoretical perfection in the matter of positive valve opening, spherical combustion chamber, direct ingress and discharge of gases, and efficient cooling propensities, as well as comparatively light weight and accessibility of parts.

Following the few particulars given in the last issue of the *M.C.J.*, we are able this week to publish a drawing and a number of photographs, from which, in conjunction with the accompanying description, a good idea of the radical departure of the new design from what has come to be regarded as the standard type will be gathered. In general appearance the new motor is puzzling: it resembles neither the familiar four stroke type nor the two stroke pattern, there being no external evidences of mechanism for opening and closing valves. But for the fact that the inlet and exhaust pipes are attached to opposite sides of the cylinder near the top, one might mistake it for a two-stroke engine, as there are no projections from the cylinder castings. Not only so, but there are no externally projecting moving parts excepting the crank-shaft ends and the cross-shaft which drives the pump and magneto, the motor thus bearing every evidence of plainness and extreme simplicity. In fact, outside the spirals which drive the magneto, water pump and commutator off the eccentric shaft, there are no gears, and so simple is the design and construction that not a single oil hole requires attention anywhere about its mechanism, the lubrication being wholly effected from the motor base.

As will be observed by the accompanying illustrations, this novel combination affords an almost perfect theoretical construc-

Fig. 1.—The new Daimler Engine.

The upper view shows the crank shaft and the secondary eccentric shaft for operating the sleeves; below are seen two general views of the motor.

spent more than five years in experimental work, during three of which time it was marketed to a limited extent in a high-grade American car. For more than a year Mr. Knight, its inventor and designer, has been at the works of the Daimler

tion. Probably the first evident advantage is the possibility of an almost perfectly spherical explosion chamber, with no pockets or irregularities, and every inch of the surface of which is machined, affording absolute uniformity of volume, contributing to perfectly even explosive pressures throughout the various cylinders of the motor, and contributing to perfect combustion, smallest possible heat losses to water jacket and consequent high fuel efficiency. Furthermore the absence of sharp unmachined corners, projecting points in the casting, and any uncooled surfaces such as valve heads or plugs, makes high compressions possible without danger of pre-ignition, and also contributes to smooth running. Aside from the advantages afforded by the regular-shaped spherical explosion chamber, the design of the motor is such as to provide the most direct and unobstructed passages for the swiftly moving gases. The fresh charge rushes directly into the cylinder without encountering any sort of obstruction which would cause it to become heated and lose weight, while the burnt gases are permitted an absolutely unimpeded path to the exhaust pipes, which are of liberal dimensions, resulting in remarkably small heat absorption to the cooling water. This direct discharge and carrying away of the exhaust gases, together with the extremely small wall area of the combustion chamber, render the matter of cooling the engine one of extreme ease, while the possible intake port area permits the filling of the cylinder with fresh gases at any engine speed desirable, there being practically no limit to the size of the openings which can be secured with this construction.

Referring to the sectional drawing Fig. 3, it will be seen that instead of poppet valves, two thin moving cast iron sleeves, A and B, are made to work together in an outer water-jacketed cylinder. These sleeves, or cylinders, are actuated by separate eccentrics on a secondary shaft, W, through the connecting rods C and D, attached by gudgeon pins to the lugs X. The eccentric shaft is driven by a silent chain off one end of the crank shaft. L is the water-jacketed cylinder head, resembling an inverted piston, carrying the sparking plugs and a wide packing ring, J, in two sections, held out against the inner walls of the sleeve A by the inner ring K, which is split in one place, the same as an ordinary piston ring. The piston travels in the cylinder A 130 millimetres (the stroke), while this cylinder, as well as the outer sleeve, B, travel 25 millimetres, the eccentric which actuates cylinder A being set 70 degrees on the circle head of the eccentric, which pulls the outer sleeve B. In operation, beginning with the exhaust, the process is as follows:—The piston travels downward on explosion stroke until it reaches a point where it is desired to exhaust. At this stage of the operation the sleeves A and B have moved downward until the lower lips of the exhaust port, F, pass behind the compression ring K. The continued downward movement of the sleeve A and B completely uncovers the exhaust port F. The latter remains open until the piston reaches the top of the scavenging stroke, when it is closed by the upper lips of the port F, in the sleeve B, telescoping with the lower lips of the exhaust port G in the water-jacketed cylinder. As the piston starts downward on the suction stroke, the ports F, through the eccentrically-actuated sleeves, move away from each other, and the opening in A is closed by the wall of B. This same movement brings ports H into register, thereby opening up the intake port and allowing the explosive mixture from the carburettor to be drawn into the combustion chamber.

When the piston starts on the suction stroke the sleeves having reached the bottom of their outward travel begin their upward stroke. The movement of the sleeve A is so timed as to carry the inner port H upward behind the ring J, just after the piston has reached the lower end of the suction stroke. This closes and tightly seals the cylinder while the piston returns on the compression stroke, the pressure of the gases aiding in keeping the ring J tightly over the ports F and H until the explosion occurs, which, if timed for the dead top centre, would find these upper ports over the centre of the ring J.

The use of a cast iron sleeve or tube as that portion of the combustion chamber in which the piston travels affords numerous

advantages which contribute to the high efficiency of the motor; principal among these are a perfectly round cylinder machined inside and out to uniform thickness, having no tendency to warp or go out of shape under heat. Probably the most marked advantage of this even-walled non-distorting cylinder is its absolute non-interference with the travel of the piston, its unvarying roundness affording a constant wall contact with the piston ring surfaces, preserving their true circular form and at all times maintaining perfect compression. Another feature which will appeal to the user generally is the detachable head which forms the dome of the explosion chamber and carries the sparking plugs and compression rings. The removal of this head is only a matter of a few minutes, which permits easy cleaning out of any carbon deposits from the piston or combustion chamber walls, or the piston and connecting-rods may be drawn upwards and out without removing the cylinders from the base.

Lubrication is effected entirely by splash, oil being fed into the base-chamber and distributed to the sleeves, pistons, and all internal mechanism by the dipping of the connecting rod big ends. The motor was originally designed for lubrication higher up in the cylinders, but this was found unnecessary and undesirable. As will be seen from Fig. 1, four large inspection covers are provided in the base chamber. The new motor does not

Fig. 3.—Sectional view of new Daimler Engine.

require any additional training on the part of the operator. In fact, its control is identical with that of the poppet valve type. The same carburettor, coils, commutator, sparking plugs, and magneto used upon the standard valve motor answer perfectly for this type. The sleeve mechanism peculiar to this construction is stated to require practically no attention whatever, so that the operator, instead of having new problems to solve in connection with the new design, may safely forget a great deal he has been compelled to learn about the grinding of valves.

The Daimler Company state that after a full year of constant test, the new motor has proved superior to the old type from every point of view, and it is only after the most exhaustive and drastic trials and investigation that the management have concluded to deliberately cut loose from the standard pattern and launch out upon the manufacture of the new and novel design. Three sizes are now in course of construction at Coventry, viz.: engines with a bore and stroke 96 by 130 mm., 124 by 130 mm., and 140 by 150 mm. The small motor is designed for a light touring car, the 124 by 130 mm. is calculated to answer all ordinary requirements for power and speed of a medium weight vehicle, while the 140 by 150 mm. type is for the heavier work. The water circulation of the small model will be accomplished on the thermo-siphon system, and in the two larger sizes by centrifugal pumps.

GOSSIP FROM PARIS.

-1-

"DON'T talk of it!" said one of the leading intermediaries for the sale of big touring cars in Paris, when I asked him whether he had done much business this summer. Never had he sold so many comparatively small cars, and never had he disposed of so few big ones. Of course, the profit on each vehicle was not what it used to be, but the number to some extent made up the deficiency. As for what would happen next year he did not care to predict, but he was certain a lot of even wealthy clients were being attracted by the taxi-cabs for town use and by the touring cars which can now be hired. My friend explained, "You see people are no longer so enthusiastic about driving their own cars. They do not find that the pleasure of holding the steering wheel compensates for the bother it entails. Then if they own the car and have a 'chauffeur' in their employ they are responsible for everything; and how can they get good honest 'chauffeurs'?" "Ils ne courent pas les rues," as the saying goes. There is no doubt a great many people nowadays hire cars of all descriptions. There are already in France over sixty companies offering motor-cabs and bigger cars for hire. Very few of them are making fortunes, and many will, in all probability, have to go through the bankruptcy court before long. It is not that the cars do not let well, but because the

The Floating Bridge across the Seine at Rouen.

risks are too heavy for the comparatively modest hire paid by the client. As my friend said, "All depends on getting good reliable chauffeurs, and that is very difficult." "If people are taking to hiring cars, how is it you have sold so many?" I inquired. The answer came pat and prompt, "Well, the horses are being driven off the road much quicker than even we expected."

THERE is no longer any question as to whether aviation is practical or not. Orville Wright has flown during more than an hour, and Wilbur Wright, Delagrange, Henry Farman, Bleriot, Captain Ferber, Esnault Pelterie, and others have maintained themselves in the air on their flying machines a shorter space of time; they were brought to the ground by nothing but the failure of their motor. Man can fly! There is no doubt of that. A certain number of very scientific gentlemen have, however, been writing to various newspapers and other periodicals to say in substance "What if he can? His flights will never serve any practical purpose." For my part I have great respect for science, but in the present case I am inclined to agree with Wilbur Wright, the former bicycle maker, who says "When an invention is made, use is always found for it." I showed Professor Simon Newcomb's article on aerial flight, published in the "Nineteenth Century," to several aviators. His assertion that an aerial vessel, whether it be a steerable balloon or an aeroplane, will never be able to replace the Scotch express or compete with the ocean steamer rather amused them

Their ambition is not so great, or at least they all contended that though railway and steam navigation companies are not in danger of being ruined by the steerable balloons and aeroplanes, companies for aerial trips need not despair of paying a dividend. Delagrange is so sure of it that he has not hesitated to place himself at the head of a company destined to be a sort of school of aviation. Kapferer, who constructed the steerable balloon "Ville de Paris" before he made the aeroplane with which he is now practising flight, will not for a moment admit that aerial vessels are to be nothing but toys for grown-up people. As for Henry Farman, his ambition is to build a good practical aeroplane, with which he hopes to show the world that long excursions can be made safely and agreeably.

M. RENE QUINTON'S National League for the conquest of the ethereal realm will work in harmony with the French Aero Club. The two associations are to remain independent from a financial and administrative point of view, but they will collaborate together, the unity of their action being secured by a committee of twelve men chosen among the leaders of the two societies. If it only keeps its promises, much may be expected from the National League, especially as it announces it has no sort of intention of seeking to usurp the rights of the Aero Club, which will remain the only French sporting authority officially recognised by the International Aeronautic Federation. Moreover, no member of the league is to receive payment for the services he may render. Everyone interested in aerostation and aviation wishes success to the new society, which has at its head such celebrities as René Quinton, Deutsch, Archdeacon, Armengaud, Michelin, and many pioneers in the campaign for the conquest of the air, including Captain Ferber, Delagrange, Esnault-Pelterie, Henry Farman, Kapferer, Julliot, Gastambide, &c.

A GENTLEMAN friend of mine who has a motor-car and drives it himself even in the streets of Paris shouted the other day, while he was passing me, "Keep to the right." I was in an ordinary horse-drawn cab, which had, it seems, blocked the way for a minute or more by keeping in the middle of the road. When I met him at a café later on he was still furious. "Why on earth cannot the cabs and omnibuses keep to the right? You should see how things are managed in London." My friend, who crossed the Channel for the first time last month, and who is enchanted with all he saw in London, especially with the way in which the police manage the traffic, is not alone to complain. The outcry is becoming general among those who use motor-cars. They cannot see why omnibuses, wagons and loading cabs, often with no fare in them, should be allowed to occupy the middle of the road, leaving no room for a faster vehicle to pass. Their grievance is not imaginary, as in fact there is in Paris only one thoroughfare, the Avenue des Champs Elysees, where the traffic is properly regulated. There the horse-drawn vehicles keep to the two sides while the centre is reserved for motor-cars. Squads of Parisian policemen have from time to time been sent to London to study the way in which the traffic is regulated there, but some of them have failed to profit by the lesson.

MARNEY.

MOTORISTS in South Wales should beware of the railway crossings, which are not always provided with gates. There is such an one between Morriston and Skewen.

THE Cast Iron Brazing Co., of Station Street, Stratford, E., to whose excellent work we made reference in our last issue, have opened an establishment at 10, Ellbroad Street, Bristol, for the convenience of motorists and others in that district.

A FIRM in the South of Ireland, Messrs. Pohlmann's, of 9, Marlborough Street, Cork, are displaying considerable enterprise in the adoption of the automobile in connection with their business. They deal in pianos, and are inviting any likely purchasers within thirty miles of the town on the Lee to send word of their intention, when they will despatch a motor-car to bring them to Cork, and take them back to their residence.

THE "FOUR-INCH" RACE.

(BY OUR OWN CORRESPONDENT.)

DOUGLAS, Monday.

ALTHOUGH practising for the "Four-inch" Race since last Thursday has not been immune from accidents, nothing of a serious nature has occurred. The weather on the whole has been of a very inclement nature, and the muddy condition of the roads has prevented the drivers from using goggles, consequent upon which most of them are suffering from bad eyes. The early hours of Thursday last week were fine, and many of the drivers completed one circuit in comfort, but about half-past six, when most of the competitors were accomplishing their second round, the conditions changed, and rain fell heavily, accompanied by a strong wind, with the result that many were storm-bound at different parts of the course. Notwithstanding the conditions, however, Coatalen went well, and his second circuit only took fifty-three minutes. Perhaps the fastest time attained was by Watson on a Hutton car.

Friday morning was fine and warm and there was a large concourse of people at Hillberry to witness the performances. The roads, however, were still very much affected by the rain of the previous day, but those cars fitted with non-skids experienced little difficulty in negotiating the corners. Most of the vehicles were out and good times were recorded. Some sensation was occasioned by the excellent performance attained by Watson on his Hutton. He completed the circuit in 43 min., which, considering the tortuous and undulating nature of the course, is remarkably fast time. Good as this performance is, however, the fact must not be lost sight of that it just equals that accomplished by George on a Darracq a few mornings ago. Resta on an Arrol-Johnston was slow on his first round, but his second attempt was much more satisfactory. Roberts, who had a narrow escape a few mornings ago by running into a herd of cattle, with disastrous results to the beasts, was out for the first time since his mishap, and traversed several circuits without incident. The two Deasy cars which arrived on the 9th inst., and which have been named "Scarlet Pimpernel" and "Long Span," excited much favourable comment, and their red coats rendered them very conspicuous. A S.C.A.T. car was the only one to experience any trouble, a wheel coming off when ascending the mountain road near Ramsey. Fortunately no one was injured and the driver was brought back to Douglas by Rawlinson on a Darracq.

Saturday was the finest morning that has yet been encountered for practice, and a large number of competitors had very satisfactory spins. The roads were hard and dry in most places, and all the drivers reported satisfactory runs which were negotiated without incident. Several of the speedometers registered 80 miles an hour. One of the Westinghouse cars was out for the first time. Its number, according to the Club, is thirteen, but the driver, no doubt from superstitious motives, has numbered it 12A. The car was, however, in trouble, and had to be towed home. The vehicle which came in for the most attention was the Calthorpe driven by Porter. Every morning since practising commenced Porter has been one of the first out, and his performances have been marked with the wonderful consistency with which they have been accomplished. On Saturday morning he traversed the course no less than three times at a very fast rate. His driving is exciting deserved admiration, and at no time is he more at home than when taking the difficult corner at Hillberry at about fifty miles per hour.

Monday was again a beastly morning and the drivers had a very hard time. Hutton, who arrived during the week-end, went over the course, but he did not push matters. Another accident happened this morning to a S.C.A.T. car driven by Buckley. While turning the Waterworks corner near Ramsey a wheel came off. Buckley and the mechanic escaped injury, but the car sustained damage, the front axle being broken and the rear axle damaged.

A meeting of the Highway Board was held on Wednesday, at which the various orders for the closing of the roads were signed. After the meeting the members were taken round the course by Mr. Orde on his Daimler car and Mr. Egan on his Panhard, and among various other matters in connection with the race that were considered was the proper barricading of the corners so that the spectators would be kept at an absolutely safe distance should any car get out of control. In fact, there was not one important point of the course which was not thoroughly considered by the members of the Board and Mr. Orde, and every possible precaution was taken for the safety of the competitors and public alike. Every part of the course will be connected by telephone with the different stations, which in turn will be in telephonic connection with the enclosure. The Isle of Man Railway Company have consented to stop the northern train service on the day of the race so as not to interfere with its progress.

DOUGLAS, Tuesday.

The practising this morning was marred by an unfortunate accident. G. W. Brown on a Coventry Humber was out for the first time since his mishap at Kerrowmoar, and appeared to be going well until he reached Willaston—a point approaching Bray Hill—where he skidded into the gutter. He quickly pulled the car into the middle of the road, but before he could recover him-

Mr. Oscar Copper at the wheel of the Metallurgique Car he will drive in the "Four-Inch" Race.

self he dashed into the hedge at a speed of about sixty-five miles an hour. The impact was so great that the car was thrown across the road into the opposite hedge, a distance of about forty feet. Brown was thrown out at the back, and was uninjured, but his mechanic, named Howarth, from Coventry, was not so fortunate. He was thrown out, and fell heavily on his stomach, and was rendered unconscious for a few minutes. A Beeston Humber driven by Read, which was following, took Brown, and Mr. Egan, of Dunlop's, conveyed the injured mechanic to Kirk Michael. The car was badly damaged, the front axle being broken, the frame twisted, and it is thought improbable that the car can be repaired in time to compete in the race. Usmar, the driver of the Vinot which met with a mishap at Creg-na-baa a few days ago, was reported this morning to be progressing favourably, but it is understood that he will not be sufficiently convalescent to drive in the race. Hutton with his special "Hutton" was out this morning. The car, which has an unknown stroke, was recognised to be capable of very great speed, and is attracting considerable notice. It is reported that some large stones had been placed on the course near Creg-na-baa Hotel in the early hours of this morning, and the Vulcan car had a narrow escape. The matter has been reported to the motoring officials, who intend taking every possible step to discover the perpetrator and deal with him in a way that the offence merits.

[BY TELEGRAM]

DOUGLAS, Wednesday Morning.

I hear that the Metallurgique cars left Belgium on Tuesday and are expected to reach Douglas by Friday.

This morning was fine and all cars in Island turned out to participate in practice. The feature of morning's accomplishments was a wonderful journey made by George on a Darracq. He completed the circuit of 38 miles in a few seconds over 42 min. This is the quickest time yet attained by any of contestants. Nothing serious in the way of accidents happened. Porter, of Belfast, driving a Calthorpe, took Hillberry Corner too fast and ran into hedge, sustaining broken spring and bent axle and body. Neither of occupants injured. Repairs are being quickly effected, and car will be out again to-morrow. Hodge, on Thornycroft, was in trouble near Ramsey through striking footpath, but with the exception of bent axle no damage was done. Vinot, driven by Outhwaite, had a narrow escape at the same point as the Calthorpe.

During the practice of competitors in the Tourist Trophy race a driver unfortunately ran into a number of calves which had strayed on to the road between Glen Helen and Kirkmichael, killing three of them. The owner's immediate concern was lulled when he found that the Royal A.C. would readily make cash recompense to him, but later on he announced his intention of

One of the Arrol-Johnston Cars which will take part in the "Four-Inch" Race.

Except that the valves are larger, that several parts have been lightened, and that a special carburettor is used, the vehicles are of the standard type. The cylinders are 4 in. bore by 5 in. stroke, and have overhead valves. The three-speed gear-box gives a direct drive to the live axle in the ratio of 3.05 to 1.

driving the whole of his live-stock on to the road during practice hours. In view of the possibilities, Mr. A. J. Wilson immediately detailed an additional couple of Dunlop flagmen to guard the scene of the threatened bovine promenade. Apart from their aversion to injuring live cattle, competitors have no inclination toward collision with even inanimate objects. The flagmen have been of great value on several occasions.

THE modern motor garage and repairing establishment of Messrs. Caffyn Bros. at Eastbourne is well known to all visitors to that popular resort. From a booklet they have just published motorists at a distance who may ever be likely to go to Eastbourne will be able to gauge the extent of this firm's accommodation for the storing and repairing of motor vehicles. The system of private lock-ups is evidently well developed and the engineering department, in charge of a fully qualified expert, is fitted with modern plant and appliances. The coachbuilding section of the establishment is equally replete with modern tools and the branch devoted to accessories is well stored with a variety of spare parts of every description.

THE SOCIAL WHIRL.

AT the instance of H.R.H. the Duke of Connaught, and at the request of the A.A., the M.U. is arranging for the erection of a warning sign on the main road on the London side of Bagshot, between the Cricketers' Arms and the bridge in the village.

DURING the visit of the Duke of Connaught to Rossmore Castle, Monaghan, as the guest of Lord and Lady Rossmore, an accident occurred, but, happily, no serious injury was caused. The Duke and the other members of the house party had motored to Eshnaglough Mountains on Friday for a day's grouse shooting in three motor-cars. On their return the Duke of Connaught and Lord Rossmore, who were in the first car, met at Cortolvin Bridge a horsed vehicle belonging to Mr. Patrick Kieran, of Monaghan. The duke's car passed the horse safely, but on the approach of the second car the animal became fidgety, and backed the vehicle into a ditch, snapping both shafts. Mr. Kieran attributes the accident to the glare of the light of the second car, the cob he was driving being very fresh.

ON Sunday evening Lord Curzon was travelling in his motor landaulet from London to his residence at Hackwood Park, near Basingstoke. About a mile from Sunningdale Station his car collided with another vehicle coming from the other direction. Both vehicles were damaged and his lordship received a wound on his forehead. After a while he was conveyed to Sunningdale Station and went to his destination by train.

THE Churchill wedding on Saturday was quite an automobile affair, the bridegroom and bride each going to St. Margaret's Church in a motor-car. Mr. and Mrs. Winston Churchill drove away to the reception in a car, and, later, made the journey to Paddington in an electromobile.

AT the Ampleforth (Yorks) Agricultural Show, to which the Hon. Gervase Becket, M.P., motored the other day, he made some remarks on the future of horse breeding, and said he did not think that the coming of the motor-car would be the going of the horse. The only suggestion he had to make was that motorists generally should drive with consideration for the use of other people—a piece of advice that is becoming a favourite text nowadays.

AN exciting encounter between an Irish stag and a motor-car has occurred near Killarney. The occupants of the car were the Gaikwar and Maharanee of Kapurthala, and they were being driven by Mr. J. Maher-Loughmann, chairman of the Urban Council and proprietor of the Victoria Hotel, where they were staying. They returned from a delightful drive from Glengarriff after nightfall through the forest, with two powerful acetylene gas lamps alight in front. Their passage was, however, disputed by a fine red deer, who charged full tilt at the radiator with disastrous results to himself. The Prince and Princess alighted from the car; the stag's body was removed from beneath it and placed beside the road on the side of the forest from whose fastnesses the deer had just emerged.

MISS MARIE CORELLI introduces the motor-car into her latest book, "Holy Orders." It appears at the opportune moment to kill a ruffian in the story who would have been hung for previous crimes had the car not been so merciful as to save him prolonged agony. And then—Miss Corelli is always up-to-date—the heroine and her lover go for a trip in a dirigible balloon, the climax being suggested in the following Kiplingesque fashion:—

When noon came both sun and sky were clear of anything more strange than the sea-birds flying across the roughening waves, and diving like winged sunbeams among the rising and falling crests of foam.

LOLLIUS.

THE NAPIER 1909 TYPE 45-H.P. SIX-CYLINDER CAR.

THAT the 1908 motor touring season is now nearing its end is indicated not merely by the keenness in the air and the presence of autumn leaves, but also from the fact that the announcements of the leading motor-car builders with regard to their 1909 models are beginning to make their appearance. Among the earliest in the field are Messrs. S. F. Edge, Ltd., who have sent us a long description and a large number of photographs of the new Napier 45-h.p. six-cylinder car, of which one or two have already been turned out, and of which regular deliveries will begin early next month. As will be gathered from the subjoined description, the changes that have been made, while large in number, are mainly confined to details, the whole chassis having been designed with the view of reducing both the cost of running and of upkeep.

Two views of the engine are given in Fig. 1, from which it will be seen that the cylinders are cast in pairs, the inlet and exhaust valves being operated from one cam shaft and inter-

Fig. 1.—Two Views of Napier 45-h.p. Six-cylinder Engine.

changeable. The gears for driving the cam shaft, the water circulating pump and magneto (when fitted) are enclosed at the front end of the motor, the wheels having helical teeth to ensure quiet running. The high-tension distributor and oil circulating pump are driven by skew gear (Fig. 2) from the rear end of the cam shaft within the crank case. The water circulating pump is of the centrifugal type; the system is, however, so arranged that should, for any reason, the pump stop working, the circulation would still be maintained by thermo syphon, assuming that the water in the radiator is at a higher level than the outlet from the engine. The water pipes are of large diameter, and the method of their attachment in the centre of the large cover plate over each pair of cylinders is such that the plates can be readily removed to give ample access to the cylinder jackets for cleansing them from water incrustation and deposit.

The water inlet pipe to the jacket is seen at H in Fig. 1, and the outlet pipes to the radiator at GG. The radiator fan, which is of cast aluminium, runs on ball bearings, supported in a substantial bracket carried on the forward end of the base chamber. The explosive mixture is furnished by a new design of car-

burettor, the main feature of which is that the opening of the jet can be varied by the driver in accordance with the work that the engine is called upon to do, so preventing waste of petrol. A general view of the carburettor, together with the hydraulic regulator controlling the admission of extra air, is seen at K and L in Fig. 1, while details are shown in Fig. 3. In the latter the regulator R is shown in a horizontal position with the air shutter chamber T unscrewed. On the engine the regulator stands verti-

Fig. 2.—Rear View of Engine, showing method of operating the oil pump and the high-tension distributor.

cally over the jet, and the pressure of the water (being greater or less in accordance with the speed at which the engine runs) acts on the diaphragm, to which is attached a plunger opening the triangular ports as the speed rises and gradually shutting them as the speed decreases, thus automatically adjusting the mixture of the gas to suit all variations of speed. The jet V has for its opening a minute hole and a narrow slot which can be just discerned. On the top of the jet is a cover or baffle held down by a spring, and having a slot corresponding in radius to that of the slot in the jet. The movement of the baffle is made to coin-

Fig. 3.—Details of "Controllable" Carburettor.

cide exactly with the gas and air throttle, and is under the control of the driver, who can uncover as much of the slot in the jet as is desired, and so regulate the supply of petrol so that no more flows than is required for the speed at which the car is required to run.

Another point to which attention may be drawn is that of ignition. While provision is made for readily installing a gear-driven magneto where desired, the standard type is by coil and accumulators in conjunction with the Napier synchroniser or high-tension distributor, which, together with the low-tension.

contact-maker, is now enclosed on the upper end of an aluminium support bolted to the rear end of the engine crank-case. Just below the high-tension distributor I, Fig. 1, is the low-tension contact maker; the shaft driven by the skew gear is provided with a six-pointed cam, on which works a roller connected with the platinum make and break points. The high-tension distributor carries a finger taking current through a steel strip and distributing it as it revolves to each of six fixed contacts connected with the plug wires, which are carried in an aluminium tube. The high-tension collector is fixed to the plate which carries the low-tension roller and the advance and retard is effected by moving this plate round its own axis, so simultaneously altering the relative position of the roller with the cam and the distributor with the collector. The whole device is beautifully made, substantial in all its details and frictionless in action; the spindle revolves in a ball bearing, while the thrust is taken on a ballrace mounted between two hardened discs.

Special attention has been devoted to the question of the lubrication of the engine, this being maintained by the pump seen at A, Fig. 1, and which, as has already been mentioned, is driven by skew gearing off the rear end of the crank shaft. B is the delivery pipe from the reservoir in the base chamber to the pump; C, the pipe through which the oil is delivered to the engine. Alongside the pump is a chamber containing a gauze

Leaving the engine and passing to the transmission it may first be noted that the clutch is of the multiple disc type. Plugs are placed in the clutch casing so that the plates can be easily washed to free them from dirt and prevent them becoming gummed together. A leather-faced plate brake or clutch stop is provided to prevent the clutch "spinning" and so facilitate gear changing. The pressure between the plates of the clutch is obtained by means of three coil springs, the tension of which can be readily adjusted. A double universal gimbal coupling is provided on the shaft between the clutch and the gear-box, which relieves the transmission from any strain which might otherwise come on it when travelling over rough roads. This joint has numerous greasers fixed to it so that every part can be lubricated.

The gear-box is adapted to give three forward speeds and a reverse with direct drive on the top. The gears, which are operated by a "gate" lever, are so arranged that when the top or direct drive is in operation the lay shaft is out of mesh and therefore not revolving; furthermore, the box is so designed that when a gear is in mesh there is always a bearing immediately next to and supporting it. The sliding gear sleeves are mounted on castellated shafts of large diameter, which ensure an easy movement together with great strength and rigidity. A special stop contained in the upper portion of the gear-box prevents

Fig. 4.—Plan of Chassis of Napier 45-h.p. Six-cylinder Car.

strainer, which can be easily removed for cleaning and through which all the oil passes. D is a relief valve which comes into operation should more oil than is actually required for the lubrication of the engine be delivered; when the correct pressure is exceeded this valve opens and the excess of oil runs back to the reservoir by the pipe E, thus preventing any smoke being emitted from the exhaust. The presser of the oil pump has an adjustment nut for the purpose of taking up any play between the plunger and the valve stem.

The crank shaft, which is made of nickel chrome steel, is retained in position by caps bolted to the upper part of the crank case, and runs on four bearings. The base chamber does not take any part in supporting the shaft but acts simply as a sump for the oil, and can be readily removed for inspection purposes. The main journal bearings and crank pins are lubricated under pressure, holes which extend from each journal bearing to a crank pin being drilled in the crank shaft. The webs connecting the pair of cranks at each end of the shaft are in the form of discs, with the view of balancing the reciprocating parts of the engine, and of ensuring freedom from vibration. The substantial design of the various smaller details of the engine is also worthy of attention, particularly the inlet pipe, with its flanged ends, the packed gland joints at the end of the exhaust pipes which allow for expansion and contraction, and the substantial size of the guides in which the valve tappets work, and the manner in which each pair is held in position by a double fork.

the gear wheels moving out of position when the gate change lever is in the neutral position. The whole of the operating mechanism and the reverse wheel are contained in the top portion of the gear-box, which is provided with three inspection covers.

The final drive is by a cardan-shaft and bevel gear to a ball-bearing live axle. The latter is of substantial design and construction, being built strong enough to transmit 120-h.p. The two internal shafts have the differential wheels forged solid with them; the differential gear is of the parallel type with six dead-hard steel pinions, these being bushed with phosphor bronze and mounted on hard steel pins. The outer ends of the external casing of the live axle, upon which the spring brackets bear, are prolonged to take the weight of the car from off the ends of the driving shafts.

The frame of the car, which is of pressed steel, is perfectly straight, without any upward or in-set, the deep section being prolonged well towards the ends to give the necessary rigidity. The rear suspension is composed of three elliptical springs, a special feature of which is that the bracket to which the transverse spring is attached projects from the side members. All strains, therefore, are transmitted through it to the latter, instead of to the centre of the rear cross member. Beyond the induction coil the only other fittings on the dashboard are the oil circulation and air pressure gauges, and the hand pump for starting the air pressure in the petrol tank.

NOTES FROM PERTHSHIRE.

THERE is perhaps no county in Scotland better adapted for motor travelling than Perthshire. The main roads are wide and in good condition; there is an excellent supply of hotels, while the scenery is superb. Situated as Perth city is, in the centre of Scotland, and forming as it does the gateway to the land of the heather and the grouse, it has ever held an important place in the now historic "rush to the North." Up to a few years ago, however, this rush was entirely confined to the railway, but this year has gone to prove that the motor-car must now be included. Prior to the opening of the grouse shooting there was a continual stream of cars of all varieties proceeding northwards, and since then dozens of automobiles have been passing and repassing daily to and from the Highlands.

This, of course, opens up a question which in the future will become a much more burning one than at present, namely, what effect motor traffic may have upon railway travelling, and it is in an annual event like the shooting season that some idea of the important place motoring is now taking as a mode of locomotion can be got. The number of passengers by rail who have come to the grouse shooting this year shows a considerable increase, but this is entirely composed of third-class passengers, there being, on the other hand, a considerable falling off in saloon and first-class travellers, or, in other words, those possessing motor-cars. When one considers the advantages derived from motoring, provided time does not interfere, as compared with journeying by rail, the reason for the growing popularity of the newer mode of locomotion is not difficult to find.

In Perthshire the motorist has been faced with the bitterest opposition from farmers, and the police-traps with which the county abounds are all more or less directly traceable to the numerous complaints made by "tillers of the land." No doubt the automobile will live down this opposition, but to advocate a give and take policy with some Perthshire farmers in their present frame of mind would be next to useless. This feeling, however, has been largely engendered through inconsiderate driving on the part of a few automobilists, and had a little more discretion and consideration for others been exercised in the infancy of motorism much of the unpleasantness now existing might have been avoided. In quite a score of cases prominent farmers in the county are all in arms against motorists, not so much from objections to the motor-car, but because at one time or other they have had an accident, or nearly so, which they believe, whether imaginary or not, was due to carelessness on the part of a motor-car driver. Whatever may have been the faults of the motorist, there can be no doubt he has begun to see through the error of his ways, as only the other day, in the course of a conversation with some half-dozen Perthshire farmers, they all admitted that greater care and consideration was now being shown by drivers when passing horses.

From the number of police prosecutions which have taken place in Perthshire this season, and the heavy penalties inflicted, one would imagine that not only would motorists drive at a slow speed, but that they would have been "driven out" of Perthshire altogether. It would be well if automobilists would contest these cases. No doubt the easiest and the cheapest way is to plead guilty, but the continual submission without any attempt whatever to controvert the statements of the police is, in Perthshire at least, creating a very bad impression against motorists in the public mind.

HEATHER.

MESSRS. BROWN BROS., LTD., to whose Autoclipse lamp and other motor specialities reference has recently been made in our columns, have just issued their new Catalogue of motor vehicles and accessories, fittings, tyres, &c. This comprises nearly 200 pages and more than 1,000 illustrations of the many specialities of this well-known motor house, whose West End showrooms are at 15, Newman Street, Oxford Street, London, the trade being supplied from their extensive depot at 22 to 32, Great Eastern Street, London, E.C.

CONTINENTAL NOTES.

The Mont Ventoux Hill Climb.

Under the auspices of the Automobile Club Vaudois, a two-days' hill-climbing meet was held on Mont Ventoux, France, on Saturday and Sunday last. The course is 21.6 kilometres long, the gradient varying from 1 in 16 to 1 in 7. The starting point was at Bedoin, between which place and the finishing point there is a difference in altitude of 5,345 ft., or just over a mile. On the first day the fastest performance was that of Gauthier, on a Griffon motor-bicycle, who climbed the hill in 28 min. 33 1-5 sec. Notwithstanding the bad weather a large number of spectators assembled to witness the performance of the high-powered cars. Bablot, with his Brasier Grand Prix, proved the hero of the day, for he succeeded in scaling the hill in record time, 19 min. 8 4-5 sec., equal to over forty miles per hour. Last year the best time (19 min. 30 2-5 sec.) of the day was made by Rougier, on a Lorraine-Dietrich. The previous record for the course was 19 min. 13 sec., made by Cagno on a Fiat in 1905.

British Motorists in France.

Recent British motoring visitors to France include Mr. Scott, London (40-h.p. Napier); Lord Rosslyn (50-h.p. Mer-

The Delivery of Milk by Motor Vehicles.

Messrs. Mooney and Sons, of Blackrock, co. Dublin, are employing the 8-h.p. Benz car shown above for the daily conveyance of milk from their farms at Baldonell to Dublin, as well as for the retail delivery to customers.

cedes); Mr. N. Reichardt (25-h.p. Darracq); Mr. Durham (24-h.p. Brasier); Sir John and Lady Brunner (24-h.p. Panhard); Lord Haversham (24-h.p. C.G.V.); Captain Jeffray (40-h.p. Daimler); and Colonel Allen (24-h.p. Napier).

Aeronautical News.

The record for flying has during the past week passed from France to the United States. Mr. Orville Wright, the brother of Wilbur Wright, astonishing the world by two flights at Fort Myers, near Washington, on the 9th inst., lasting 57 min. 31 1-5 sec. and 1 h. 2 min. 15 sec. respectively. The following day he remained in the air for 1 h. 5 min. 52 sec., on the 11th for 1 h. 10 min. 24 sec., while on the 12th he surpassed all his previous records by flying 1 h. 14 min. 24 sec. The greatest altitude reached by his aeroplane was 250 feet. Earlier in the day he had taken a passenger with him and flew for 9 min. 6 sec. In France one of the events of the week has been the formation in Paris of a company with the object of encouraging those who are bent on the conquest of the air. The concern, which is known as the Compagnie d'Aviation, has a capital of £8,000, and M. Delagrangé is a director, and a moving spirit in the enterprise. A suitable ground near Paris is being secured for experiments. A charge will be made for the use of sheds, though aviators who do not require them will be permitted to use the field free of charge. To encourage the sport contests and races will be

organised. There will be stands on the field, and, of course, the public will have to pay for admission. The aim of the company is to offer valuable prizes, so that aviators from all parts of the world may be attracted to give exhibitions and trials. On the 10th inst. Mr. Wilbur Wright made the longest flight he has so far achieved since he settled at Le Mans. Rising to about 100 feet he flew for 21 min. 45 sec., covering about 17½ miles. M. Bleriot suffered another disaster at Issy-le-Moulineaux on Saturday last. He made a number of successful flights, reaching an average altitude of 45 ft. Finally his machine fell to the ground from a height of 30 ft. and was totally wrecked. M. Bleriot was fortunately not injured. The German army airship the Gross, on Friday and Saturday last week, accomplished a circular tour which occupied 13 h. 2 min., thus establishing a new record. The average speed was 20 kilometres per hour and the distance covered about 300 kilometres.

Speed Trials at Salon.

A series of flying kilometre and five kilometre speed trials

French Motor-car Imports and Exports.

Returns just issued show that the value of the foreign motor-cars and parts imported into France during the eight months ending with August last amounted to only £200,400, as compared with £245,040 in the corresponding period of last year. As regards the exportation of French motor-cars and parts, the aggregate shipments during the eight months recently ended only totalled £3,581,880, as contrasted with £3,884,240 in the similar period of 1907.

Industrial Motor Vehicles in Russia.

It is announced that a syndicate of financiers have just submitted to the Russian Minister of Finance the articles of association of a joint-stock concern formed with the object of providing a motor service for goods transport in the districts of St. Petersburg, Moscow, Odessa, and Kieff. The capital of the company is 5,000,000 roubles. Twenty motor lorries are stated to have already been ordered in England. Another company has applied for a concession to run a public motor-car service

Speed Trials at Salon, France.—Bablot finishing the Flying Kilometre at a speed of over 100 miles per hour on a Brasier Grand Prix Racer.

was held on the road between Salon and Arles, France, on the 10th inst. In the flying kilometre the honours of the day fell to Bablot, who, driving a Brasier Grand Prix racer, covered the distance in 21 2-5 sec., equal to a speed of nearly 104 miles per hour. Alezy, on a Clement-Bayard six-cylinder, who came next in 22 1-5 sec., had, however, his revenge over the five kilometres, his time for which was 1 min. 52 sec., as against Bablot's 1 min. 54 sec.

German Motor-car Imports and Exports.

A very quiet state of affairs continues to prevail as regards the imports of motor-cars into Germany. The arrivals of pleasure and industrial motor vehicles and chassis into the country during the seven months ending July last only attained a value of £435,718, as compared with £608,173 in the corresponding seven months of 1907. During the same periods the value of the similar exports from Germany declined from £421,160 to £411,225.

between Elima Kyrokoby, Lapptrask, Mushla and Koria, in Finland.

Miscellaneous Items.

The Northern Games, which are to be held at Stockholm in the second week of February, 1909, will include a number of motor-car races on an ice-bound lake.—Over sixty entries have been received for the Austrian Automobile Club's annual hill-climbing competition up the Semmering, which takes place on Sunday next. In the racing car section the competitors comprise several Grand Prix cars, including the Mercedes, Fiat, Benz, and Mora.—The Automobile Club of Ostend et du Littoral is organising a flexibility and reliability trial for the 26th and 27th inst.—The Automobile Club de la Sarthe is organising a hill-climbing competition to be held on the road between Le Mans and Saint Calais, France, on October 4th.—The annual hill-climbing competition at Gaillon, France, is also to be held on October 4th.

ONE of the leading motor-car firms in the United States is adopting an automatic tyre inflator as a standard fitting on its 1909 models.

A MOTOR-CAB driver was fined 1s. at Lambeth for carrying a greater number of passengers than his vehicle was licensed to carry. He descended Brixton Hill with five passengers in a cab permitted to hold two.

THE military authorities at Dublin are inviting tenders for the supply of motor-cars in the Irish capital for the use of the Army Service Corps for a period of six months from October 1st. Such will be received at Lower Castle Yard, Dublin, until noon on Monday next.

A TWENTY-FOUR HOURS' motor race on the Brighton Beach track, New York, was held on the 12th inst. The event was won by a Lozier car, which, driven by Mulford and Cobe, who took the wheel in turns, covered 1,107 miles. Another Lozier was second with 1,092 miles to its credit, and a Fiat third.

MESSRS. C. S. SADGROVE AND CO., of 4, Hans Road, London, S.W., have sent us a photo depicting the fleet of four Darracq cars they have supplied to the sons of Admiral Bromley. The admiral himself has now ordered a 25-35-h.p. Darracq landaulet from the same firm, which will bring the number of vehicles of one make in the family up to five.

THOSE who are intending to take positions in the automobile industry should become acquainted with as many aspects of its work as possible. Several applicants for situations have lately failed, despite their other qualifications, owing to lack of knowledge of the H.F. vulcanizing process. This can easily be remedied on application to Messrs. Harvey Frost and Co., at 39, Great Eastern Street, London, E.C., where the firm provides ample facilities for chauffeurs to obtain complete knowledge of their standard vulcanizing methods.

ON a recent evening a 12-16-h.p. Clement-Talbot car, with a limousine body, the property of Messrs. Strettons, Ltd., was being driven by Mr. L. Edwards from Northleach to Cheltenham. On the way the car ran out of petrol, and the driver got down and proceeded to open a can to refill the tank. Just afterwards the vapour given off by the liquid became ignited by the side lamp which was near by. The whole car immediately burst into flames, which, despite prompt action, could not be checked. In a short space of time the flames got a hold on the car, and the vehicle was soon destroyed. The affair was a pure accident, no one being to blame in the slightest way. The car was partly insured.

MR. B. S. KEMP, of Chesham Birs, Bucks, has furnished the Rover Company with a brief account of an interesting tour he recently made on one of their 6-h.p. cars which had previously run nearly 5,000 miles. Leaving Chesham on June 27th, the first day's run was Huddersfield, 180 miles. Thence he went through the Lake District, over Shap, up the west coast of Scotland as far as Ballachulish, taking "Rest and Be Thankful" among other notable hills. From Ballachulish he crossed Scotland to Inverness and on up the east coast to John o' Groat's, and nearly to Cape Wrath. Then down through Sutherlandshire and across again to Inverness and on over the Grampians to Dalnaspidal and Dalwhinnie to Pitlochry, where Mr. Kemp turned and came down the west coast to Dumfries, and over Shap and so home. The trip, including various off days for fishing, walking, &c., occupied a month, and the total distance covered was just under 1,900 miles. Throughout the entire period he had not one single stoppage on the road, and he never touched the car with a spanner or any tool throughout. The passenger and driver totalled 24 stone, and a large trunk of considerable weight, fishing rods, bag and oilskins, &c., were loaded up behind. In addition Mr. Kemp carried four gallons of oil, a spare two gallons of petrol, a spare tyre, tubes, and a large kit of tools, including a vulcanizer. The petrol consumption worked out at 37½ miles per gallon, and that of lubricating oil for all purposes 450 miles per gallon.

At the recent Cardiff Horse Show Messrs. J. Norman, Ltd., exhibited two motor bodies they have built for two well-known motorists.

THE War Office having offered Bradford Corporation terms for the hire and purchase of motor vehicles in case of emergency, the Tramways Committee have agreed that the two tramway motor-lorries owned by the Corporation should be enrolled.

THE Bradford Fire Brigade Committee has recommended the Council to purchase a motor fire engine from Messrs. Dennis and Co., of Guildford, at a cost of £850. The engine of this machine drives the vehicle, works the pump, and can also be used as a chemical extinguisher in the early stages of a fire.

ACCORDING to a report from Sydney there has recently been a marked expansion of the motor-car business in Australia, it being estimated that there are at least 1,000 cars running in New South Wales alone, although only three or four years ago there were not over forty. Originally French cars were most in demand, then American vehicles came to the front, but now British makers have succeeded in largely capturing the market.

MESSRS. F. S. NICKELLS AND CO., of 2, Dornberg Road, Blackheath, S.E., have lately brought out an improved form of instantly detachable ignition terminal connection, which appears to possess some useful features. The device as made for high-tension wires is shown in the upper portion of the accompanying illustration, while that for the low-tension system is depicted at the bottom. The method of attaching the wires is so clearly shown that no description is necessary. The point about the

device is, that by simply squeezing the side, holes in the two bottom strips are made to coincide, so that the connection can be slipped on to the terminals of the accumulators or sparking plug, &c., a firm and rigid connection being made as soon as the pressure on the fingers is relieved. The little fitting shown in the centre of the picture is a device by means of which an electric inspection or tail lamp can be connected up to the accumulators without interfering with the ignition wires, the metal end of the flexible connection being simply pushed into the special position provided for it on the terminal. Messrs. Nickells are putting these useful accessories up in boxes of eight at a popular price.

WE have received from the Manufacturers' Association of Great Britain, Queen Anne's Chambers, Westminster, an official copy of the new Australian Tariff (with index) as finally revised for 1908, and are informed that British manufacturers may obtain copies of same on application to the offices of the association. The following are the import duties relating to automobiles:—Bodies for motor lorries, and wagons and parts thereof, general tariff 35 per cent. *ad valorem*; British productions, 30 per cent. Chassis for motor wagons and lorries, general tariff 5 per cent.; British manufactures free. Bodies for motor-cars and parts thereof, general tariff 35 per cent.; British 30 per cent. Chassis for motor-cars, but not including rubber tyres, general tariff 5 per cent.; British made free.

THE AUSTRO-GERMAN MOTOR VOLUNTEER COMPETITION.

The Austrian and German Motor Volunteer Corps recently held a joint trial between Vienna and Berlin. The above illustrations, reading from left to right, show (1) a group of officers awaiting the cars at Berlin, (2) Officers inspecting the cars at the end of the run, (3) An early arrival at Liegnitz, (4) The Control at Liegnitz. *Autosport, Liegnitz.*

SUCCESSFUL SPEEDOMETERS.

Smith's Speed Indicators.

In many police-courts throughout the country Messrs. S. Smith and Son, Ltd., have demonstrated the capacity of their speedometers to rebut police evidence in motor cases; and at their show-rooms at 9, Strand, London, W.C., we have just examined a range of the firm's specialities, which illustrate the scientific care taken in their construction. For three-quarters of a century Messrs. S. Smith and Son have held a great reputation in connection with watches and other instruments where precision was absolutely necessary, and when they commenced the manufacture of speed indicators the King naturally ordered one for his car. Since then the royal appointments of the firm have been extended and there is scarcely a Royal garage without its Smith's speed indicator. The instrument is made in various types—a simple speed indicator showing speeds varying from 5 to 40-100 m.p.h.; a new model in which a speed indicator and a watch are cleverly combined; a speed indicator and electric communicator, and a triple instrument, comprising indicator, watch and communicator in one excellent device. The driving mechanism consists essentially of an aluminium ring, screwed to the wheel of the car, and of a pulley, which is pressed against the ring by a flat spring. The pulley is provided at its periphery with a rubber tyre. This not only ensures silent running, but also serves the useful purpose of increasing the friction between pulley and ring. When the car is in motion the pulley is rotated by friction, and transmits its rotation, by means of a flexible steel wire, to the speed indicator proper, which may be placed in any position convenient to the driver. The steel wire is enclosed in a flexible metal tube. Within the case of the speed indicator there is a small centrifugal governor, which is driven

from the steel wire above referred to through a train of toothed wheels. The axle of this centrifugal device is horizontal, and consists of three parts, which telescope within each other. There are also three springs of different size, which successively come into action as the speed increases, the weakest spring being compressed first. After a certain speed has been attained, the latter is prevented by a suitable collar from being compressed further, and the next size of spring comes into action. After a further increase of speed, the third spring is also used. The three spring device described forms the special feature of the instrument, and its advantage lies in the fact that it permits of an open scale, not cramped at one end as is often the case. The movement of the centrifugal governor is transmitted to the dial hand by a grooved sleeve and a pinion, and any backlash is taken up by a spiral spring, which continually tends to move the hand back to zero. The latest form of indicator is fitted with a mileage register up to 10,000, and a trip recorder which can be set to zero at will. The indicating hand is placed in the centre of the dial, and indicates in the standard design all speeds from ten to sixty miles per hour. Lubrication is simple, and the indicating hand is unaffected by vibration. Recently we described and illustrated some of the popular types of these indicators, notably the "Runabout" and the "Popular," which are specially designed to meet the pockets of men of moderate means—a phrase that is losing its point now that such motorists constitute the majority. In attaching the indicators a S spring is now employed to enable a perfect contact with the wheel. The firm have brought out the new model illustrated above, fitted with a maximum hand, which by the use of the key shown, instead of a push pin as previously employed, can be made to fall to the ordinary hand, thus combining to indicate the speed at which the vehicle is then travelling. Motorists near London will be well advised to inspect the exhibition of these devices at No. 9, Strand,

London, W.C.; those living at a distance will find much of interest in the firm's excellent catalogue.

The Britannia Speedometer.

The "Britannia" combined speedometer and mileage recorder is the introduction of Messrs. Dobbie McInnes, Ltd., of 45, Bothwell Street, Glasgow, and is illustrated below. The makers have long been associated with the manufacture of speed indicators for general purposes, so that in developing their ideas in connection with motor-cars they had the advantage of experience in kindred directions. The "Britannia" speedometer has a horizontal centrifugal regulator, and

this is combined with a subsidiary clock-gear mechanism controlling the movement of the pointer. The latter being thus separately energised, and not directly connected to or moved along the scale by the centrifugal regulator, does not hamper the finer movements of the latter, on which, of course, the accuracy and sensitiveness of all such instruments depends. A friction drive of simple construction is employed. The mileage recorder is contained within the case of the speedometer, and the mileage up to 10,000 miles is shown through a small window in the dial, a feature of value being the distinctness of each figure. Ample provision is made for the lubrication of every working part of the instrument. The "Britannia" speed indicator is secured to the dashboard by bolts or screws with ease, and altogether the device is one of merit and ingenuity.

Bailey's Miloscope.

At the Cordingley Motor Show held in the spring one of the novelties attracting considerable attention was the speciality of Bailey's Motor Miloscope Company, 225, Oldfield Road, Salford, Manchester. This was the miloscope or motor-car speed indicator illustrated herewith. The makers lay great claim to the simplicity of the device, which is entirely without gearing, governor, or other delicate mechanism liable to soon get out of order. There is only one moving part, which runs in a ball bearing, and the indicator will stand the vibration, jolts, and jars which may be encountered when fitted on a car. This miloscope depends on centrifugal force, the material acted upon being a liquid which cannot wear out. The revolving vessel consists of two parts, an upper and a lower, connected together by three tubes. The centre one is of glass, the outer two being of brass. The lower chamber and the tubes are filled with liquid; on revolving the instrument round its vertical axis the liquid falls in the glass tube, rising through the brass tubes into the upper vessel, taking up a level which varies according to the speed. There is a float in the centre tube seen in the illustration which acts as a pointer, and enables the speed to be read from the scale at the side. On this scale the speed is indicated at anything from zero to fifty miles an hour. The instrument is hermetically sealed, is instantaneous in action, and quite dead beat. The ball bearings are the only wearing parts in the instrument, and the driving gear, by means of a flexible shaft running at a moderate speed, is simple and easily fixed. Bailey's Miloscope can be driven from the front wheel of the car through this flexible shaft or from any revolving shaft by means of a spring belt. In addition to the miles per hour, the device also indicates the total mileage, and has a neat appearance when fixed to the car.

Correspondence.

(Letters to the Editor should be addressed to the office, 27-33, Charing Cross Road, London, W.C.)

THE PUBLIC ATTITUDE TOWARD MOTORISTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sure I have only shared the interest which must have been felt by your other readers of Mr. Stenson Cooke's letter in your recent issue; and assuming, as we are entitled to, that the statements are true, the attitude adopted by the Newmarket police is deserving of the utmost reprehension on the part of right-thinking citizens. One can only regret that the pernicious example set by certain benches of magistrates and their obsequious minions has had this baneful influence on the police.

Now, it would be unreasonable to expect that everyone should welcome the introduction of the new form of locomotion. A reference to the pages of history would quickly dispel any such expectation. The outcry against the railways was, indeed, far more virulent than that at present being engineered against the automobile. But in the deluge of unmerited obloquy and atrabilious vituperation to which the motor-car, and everything and everyone connected with it, is being at present subjected there may be, undoubtedly, some occasional complaint which has some more legitimate foundation than mere owlish obscurantism, and such complaints should be carefully inquired into, and the cause, if existent, removed. This is the attitude adopted by the overwhelming majority of motorists in this country, and it is certainly the attitude, if not the very cause of the existence of the various motoring organizations in the kingdom. The suppression of the road hog is the aim not only

make it popular to journey through the highways, which have been practically deserted since the extinction of the stage coach. Such traffic through those highways must confer immense benefit on the rural population, just as the withdrawal of the stage coach was the cause of considerable distress, and when we hear that an attack on motoring is being engineered at Newmarket, it might be pointed out that such an attack is surely very ill advised.—Yours truly,

FAIR PLAY.

DISC CLUTCHES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—My experience of disc clutches has impressed on me the importance of correct lubricating in obtaining efficient results; but, as is always the case, the tests of the suitable lubricant have to depend on the pressures, temperature, and speed. For instance, on my Napier, if my clutch springs are screwed up, I must use a more viscous oil if I wish to avoid fierceness. Again, on a cold morning the clutch may slip, owing to the oil being too viscous at the low temperature. Or, on a hot day, and especially with the frequent declutching as in traffic, the oil may be too thin. My firm, when asked to advise in cases of clutch troubles, suggest to the applicant that he should fill his clutch with a medium bodied oil, and gradually add paraffin until he gets the best all-

Five of the German Daimler 6-ton Motor Lorries that are about to be put in service in Antwerp.

of the few hysterical anti-motorists who attain a brief notoriety in the columns of the daily newspapers, or in the meetings of various insignificant local bodies. That the present speed limit is utterly inefficient in attaining the object of its imposition is proved by the attitude of these wisecracks of the eastern counties. Everyone, motorist or non-motorist, desires that all forms of traffic should make use of the highways in such a manner as not to endanger the lives or limbs of the lieges, or in any way cause detriment to property. But, while the policy of the A.A. in placing its scouts upon the road would largely conduce to this end, that in no way, apparently, meets with the views of the Newmarket police. The compilation of a handsome addition to the local revenues by means of fines seems an object of a much more meritorious description, and in the present unfortunate state of our legislation on the subject the Dogberries of any squalid hamlet are given an unfortunate amount of freedom in this direction.

The automobile organizations have done everything in their power to prevent the misinterpretation of the law, yet we find that a very common accusation hurled against these bodies by the Press is that they and their members are desirous of "evading the law." Were a refutation of this calumny necessary it would be found in the fact that the Archbishop of Canterbury, the Bishop of London, many Cabinet and ex-Cabinet Ministers and members of both Houses of Parliament belong to one or other of these organizations. It would be supererogatory to point out that men in such positions are incapable either of personally evading the law or giving any encouragement to such evasion. But, on the other hand, men holding such exalted ecclesiastical and political positions are ever ready to give every encouragement to the eradication of such a social nuisance as has evidently broken out at Newmarket. Without even claiming for the motorist that "even his failings leaned to virtue's side," it might be pointed out, especially to the authorities at Newmarket, that the motorist has again begun to

round results. He then sends a sample of this all-round mixture to us, and we are able to supply him with a clutch oil of the same viscosity, but of course free from paraffin. I trust this simple and fairly efficient method may be of use to your readers who have trouble of this nature.—Yours truly,

A. DUCKHAM.

A CAR FOR THE SCOTTISH HIGHLANDS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As there must be many who, like myself, require each season, for shooting lodges in Scotland, a moderately-priced car, which is able to run over roads that are sometimes little better than tracks, I think it would be interesting to hear from your readers what they consider the best chassis for such a purpose. My own ideas are that the following conditions are essential:—

- (1) Chain driven, for I feel sure no cardan shaft would stand the work.
- (2) A four-cylinder engine (probably two ignitions).
- (3) Extra strong springs.
- (4) Weight of chassis not more than 15 cwt.
- (5) Top speed up to 25 m.p.h. without accelerating, and carrying six people.
- (6) Tyres, solid would be best if the machinery would stand it.
- (7) Price of chassis not to exceed £400.

For the last three seasons I have used the same 8-11-h.p. three-cylinder Panhard (with a very light wagonette body), which has been most satisfactory, but it just lacks a little power for hills, although it will go up anything at its own pace, and, although only fitted with magneto ignition, I have never had the slightest trouble with it. As to

tyres, I use the old-fashioned Collier, and these stand very well, some of them doing two seasons' work, but, of course, they are somewhat difficult to detach if one does have a puncture.

In conclusion, I think the Panhard would be an ideal car for the purpose if it had four cylinders without increase of weight, and as the present price of a three-cylinder chassis is only £300, such a car could easily be built at the price of about £350. If anyone knows of a suitable chassis I should be glad to hear of it, but of course one wants a car that will last, and not merely do for one or even two seasons.—Yours truly,
W. P. BRIGSTOCKE.

SOME NEEDED IMPROVEMENTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In response to "Arcanum's" invitation in the *M.C.J.* of the 29th ult. for points in which makers of motor-cars might effect some improvements in their vehicles, I venture to draw attention to the undershields fitted to many cars. Many of these are so fitted that it is quite a task to detach them whenever the operation becomes necessary. While these shields no doubt fulfil their purpose admirably, they are sometimes a great nuisance, especially when one happens to drop any small tool they may be using, or even a nut or bolt which one has usually to "fish" for in a pool of oil and dirt. That this is not an unusual thing is shown by the introduction by one of the accessory firms of a device known as an electro-magnetic nut-catcher, by means of which any small parts which may drop into the gear-box or undershield can readily be recovered.—Yours truly,

S. KNIGHT.

THE CAUSE OF A KNOCK

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the driver of a 10-12-h.p. Argyll car with Aster engine, and would be obliged if you could give me the cause and remedy for the following:—The car runs well on the level road, but on going up a very slight hill will knock very badly, and practically stop. I have retarded the ignition but the knocking still keeps on. At times I hear an explosion at the exhaust. Would too rich a mixture cause the trouble? The carburettor is of old pattern, the air and gas are regulated by hand. I shall be greatly obliged by any information you can give me.—Yours truly,

ERNEST BROWNLESS.

[Perhaps the ignition on our correspondent's car is not sufficiently retarded for hills. Looseness of the connecting joints or other cause may allow too small an arc of movement to the contact maker. This should be verified by checking the position of the pistons when spark passes at plugs with the ignition lever retarded.]

The knock suggests the advisability of a thorough overhaul of the engine, taking up all loose bearings and scraping out the cylinder heads. Too rich mixture, if such is the case, will certainly not improve matters, and is most likely the cause of the explosions occasionally heard in the silencer.]

TAPER CYLINDERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The motor-car of the present day has now reached such a high state of efficiency that it is somewhat difficult, when taking general construction as a whole, to see in what given particular any great improvement can be embodied that will add to economy in working or materially assist in obtaining a higher state of evolution. Makers have spent much time and money—doubtless from a business point of view—in bringing about the present standard of car as we now know it, but a fruitful source of information is the correspondence columns of the *M.C.J.* and other papers that are devoted to the automobile or self-moving vehicle.

The cylinder of the internal combustion engine forms a most important part of the latter's anatomy, for it must be remembered that it is here that the "vital spark" springs into life; the latent energy takes active form, which causes a harmless mass made of various materials to burst forth into a wild-tearing monster that is capable, when under control, of giving untold joy to those who throw their lot in with it; but which, if, on the other hand, like all great powers, it is allowed to get beyond control, is turned into an engine of destruction that may spread disaster around. There have of late appeared many letters on the subject as to the advantages or otherwise that may be gained by boring the cylinders of a petrol motor so as to give more clearance at one end than the other; in other words, to bore it taper so that the sides are not parallel.

I do not propose to go into the many technicalities but only to explain in simple words the reasons why the matter is worthy of consideration. To realise the very high temperatures that the cylinders of an internal combustion engine are subjected to, it is only necessary to remember that resort to some kind of a cooling process, either through the agencies of air or water, is absolutely necessary, whereas in the cylinders of the steam engine not only is such a heat-reducing factor not required, but the reverse element is brought into play, the trunk being encased in a steam jacket to stop as far as possible condensation. The heat in this latter form of cylinder is nothing like so great, and water, though a

poor co-efficient, is to a limited extent a lubricant; in addition to this the steam enters the cylinder at alternate ends and combats the piston on the reverse side each stroke that it travels the cylinder walls. In the case of the internal combustion engine, on the other hand, the ignited gases always make their entry at the same end of the cylinder and on the top side of the piston.

The natural consequence of this is that the cylinder walls are hottest at the compression end, and so must expand more than at the other. It may be said that the piston also being hot expands too, and so equalises any over-expansion of the trunk; but it must not be forgotten that the piston travels into a cooler part of its casing every trip. Such a sequence of events tells one that if the rings are a perfect gas-tight fit at the cool end, they must be loose when they reach the zone which has the highest temperature; if the rings, when in the coolest part are not a good gas-tight fit, there is loss of compression and consequent decrease of power. If the fit is all that it should be at the compression end, there is a decided tendency to "seize" at the other. The grooving and loss of effective force (so often heard of) by undue pressure on the side walls is oftentimes the result of such excessive friction. Motorists may think this is a subject that is not within their province, but one for manufacturers only; this is quite an erroneous impression; cylinders that have parallel sides may be rebored and made taper. For the information of those who may feel disposed to try it, a clearance of 1-70th to 1-90th of an inch may be accepted as ample for all purposes, but no actual hard and fast line can be laid down, as the amount of taper must depend upon the size of the cylinder, although any great variation from the above mentioned tapers would only apply to very large and powerful engines.—Yours truly,

E. T. H.

The 2-ton Petrol Lorry recently supplied to Mr. W. Banfield, of the Taff Aerated Water Works, Pontypridd, by Leyland Motors, Ltd.

CHARGING ACCUMULATORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an electric lighting plant from which I should like to be able to charge my 15 ampere-hour ignition accumulator. The installation consists of 150 lamps of 16-c.p. at 100 volts continuous current. The lamps are ground in sets of ten, i.e., one switch controls ten lamps, and I also have at intervals wall sockets for connecting up extra lamps as required. I should be glad if you could inform me if I would be safe in taking current from one of these wall sockets to charge my accumulator?—Yours truly,

DONCASTER.

[It is an easy matter to charge a 15 ampere-hour accumulator from a 100 volt installation, but on no account should the attempt be made to do so from a wall socket, as this would result in connecting 100 volts on to the accumulator, which would probably destroy it in a few moments. All that is necessary is to obtain what is known as a charging adaptor from an electrical firm, and use this from one of the electric lights. A charging adaptor is simply an ordinary lamp holder with a flexible cord attached to it in such a manner that one can charge an accumulator in series with an incandescent lamp. The lamp should be removed from one of the pendant fittings (inserting the charging adaptor in its place, which it is made to fit), the lamp being put into the holder which is provided in the adaptor. A flexible cord is fixed in the holder, and after testing the two ends of this with pole-finding paper to ascertain which is the + wire, the accumulator should be connected up, taking care to connect the wire from the adaptor to the terminal of the accumulator. The latter is charged by the current passing through the lamp and then through the battery, the lamp acting as a resistance and preventing too much current flowing through the accumulator.]

A TRIAL RUN IN SCOTLAND.

MR. PERCY RICHARDSON, the managing director of the Sheffield Simplex Motor Works, Ltd., has furnished us with the following account of a run he recently made over a greater part—including an official hill climb—of the Scottish Reliability Trial course with one of the new model Sheffield-Simplex cars which the company are putting on the market for the 1909 season: Owing to the question of patents we are not at present able to make known the details of the improvements which have been effected, but we are breaking no confidence in stating that they relate to a considerable simplification of motor vehicles, a large number of parts which have hitherto been considered essential to a touring car having been entirely done away with. Previous to starting on the trip described below by Mr. Richardson, the car had, according to the motometer, already covered 3,597 miles, during which period it had climbed a number of well-known hills in Derbyshire and Yorkshire, and also in the South and South-West of England, of such fame as Chapelton, Mam Tor, Snake, Cat and Fiddle, Birdlip, Bath Street, Frome, Porlock, &c.

"The start was made from Tinsley, Sheffield, on the afternoon of Friday, the 28th ult., and the road taken was that to Doncaster, where the Great North Road was joined, to York, Thirsk, Northallerton, Darlington, and Newcastle-on-Tyne. Here a stop was made for the night, the car having covered this distance of 134 miles on the top gear. After showing the vehicle to a few friends in Newcastle the following morning we passed through Morpeth, Alnwick, Berwick, Dunbar, on to Edinburgh. At the latter place we had arranged for Mr. W. E. Townsend to accompany us over the Scottish trial course in order to guide us aright over the unknown roads brought to light by the Scottish Club.

at the commencement, varying from 1 in 5 to 1 in 10 in gradient, we slipped in the top gear, which the car took rapidly for a considerable distance at a surprising speed, and it was not until the steep and tortuous portion near the top of the hill was reached that it was necessary to drop to a lower gear, on which the vehicle finished the hill climb with the greatest ease. Returning again by the same route to Aboyne, we put up for the night there at the Huntley Arms. The distance for the day was 123 miles, and included two hill-climbs; up to this time it had only been necessary to come off the top gear on five occasions, those being at the actual hill climbs themselves.

The next morning we started off for the Trinafour Hill, and leaving Aboyne passed over the trial route through Dafftown, Tomintoul, to Grantown-on-Spey, where we lunched. On the way to this point we took the two stiff ascents of the Bridge of Avon and the Bridge of Brown, as well as the difficult descent between these two points. The car glided along on the top gear the whole of this distance with the exception of the two steep ascents mentioned, which made it necessary to drop to a lower gear, and even on this the vehicle did these stiff climbs well up to the legal limit. Leaving Grantown we passed along the main Highland road running from Inverness to Perth, going through Aviemore, Kingussie, Dalwhinnie, and Dalnacardoch. On leaving the main road for Trinafour at this point we crossed the old disused road across the moor, the car still maintaining its top speed notwithstanding the long and difficult ascent, then on descending the opposite side of the hill our Scotch companion pointed out the Trinafour Hill climb rising in the distant country. Stopping the car at the starting point of the hill-climb my friend gave the word and off we went. Within twenty yards the car was again on top speed, and for some time, owing to the curves on the road, it was necessary to keep the throttle partially closed; however, when the road became visible for a safe distance, the throttle

On An ulree Hill.

TESTING THE 1909 TYPE SHEFFIELD-SIMPLEX SIX-CYLINDER CAR IN SCOTLAND.

Arriving in Edinburgh late in the afternoon, we pushed on, after having tea, to Perth, making a total for the day of 193 miles—everything having still been taken on top gear. Leaving Perth on the Sunday morning we ran on through Blairgowrie, and entered the famous Spittal of Glenshee. The car was still sliding along on its top speed, and continued to do so right away up to within a short distance of the bottom of the notorious "Devil's Elbow," where the gradient, for the first time since leaving Sheffield, a distance of approximately 360 miles, made it necessary to use a lower gear. On this the car romped round and up the awkward, steep double bend of the "Elbow" with ease, after which it was reversed down on to the worst portion for the purpose of snapshotting. The vehicle easily started again on this bad gradient, and after having to keep it on the lower gear a short distance until the top of the ascent was reached, the top speed was again slipped in, and we ran silently and smoothly on to Braemar.

After leaving Braemar and proceeding along the main road towards Aberdeen, passing on the way Balmoral Castle, we turned south at Aboyne and reversed that portion of the Scottish Trial road in order to get direct to "Cairn o' Mount." From Aboyne we passed through Strachan and went up the opposite side of the hill climb. This is not quite so steep in itself as the hill climb, but will be remembered by those who took part in the trials as having a very long and severe gradient with a rough and loose surface. The car went at this gallantly, and with the exception of one short piece at the bottom and the last few hundred yards at the top, took the whole of the ascent on the top gear, at a speed well above the legal limit. Arriving at the top we ran down the "Cairn o' Mount" and turned round at the bridge at the bottom, so as to start at the same point as in the trials. The car, starting on the low speed, sprang at the hill, and after mounting the well-known steep bit

was opened full and the car simply shot forward, taking the top gear with ease right over to the top of the hill. Our cautious Scotch friend had been gradually getting enthusiastic over the capabilities of the car, but after climbing Trinafour on the top gear he could not control his enthusiasm any longer, and came out with the words, "Well, Trinafour on top, it is the best piece of work she has done, and if I had not been with you I should not have believed it."

After this we passed on to Tummell Bridge, across the famous Pass of Killiecrankie, through Pitlochry and Dunkeld, and put up for the night at Birnam, in order that first thing the next morning we might tackle the much-discussed Amulree Hill, having during the day covered 169 miles. On leaving Birnam in the morning we were soon at this noted hill, and without a doubt it certainly did look, and proved to be, by far the most severe hill that we met. We ran on the top gear from Birnam to the bridge at the bottom of Amulree, when it became necessary to slip into a lower gear, on which the car easily tackled the hill. All went well until we came to the noted bad double bend, and here we misjudged the first corner and were just unable to get the car round. However, on getting down to examine the corner we came to the conclusion that it was quite possible to get round without reversing, so we let the car run backwards down the hill for a matter of 20 yds., and then went at it again. This time the car took the difficult double bend without a falter in a perfectly clean manner, though there was little left to spare. In order to test its starting qualities under such severe conditions, the car was again backed on to what appeared to be the very steepest part and was started again with ease.

After having had the experience of going over this hill we must say that it is the worst we have ever encountered with a car, and deserves the notoriety that it has gained. Whether it is fair to ask cars to climb

a hill like this in a trial or not we do not propose to discuss, but certainly a vehicle that can take such a hill would be capable of going anywhere even the most exacting would require. After surmounting this "masterpiece of a hill-climbing test," we drove the car across the moor and down the practically equally difficult descent into Kemore. From there we drove along the side of the lovely Losh Tay to Crianlarich, where we lunched. After this we passed along the side of Losh Lomond, and, arriving at Tarbet, we turned west through Arrochar and on to the renowned "Rest and be Thankful." We pulled the car up on the official starting place for this hill, and starting off at the same the car quickly took the top gear, on which it romped along for about two-thirds of the way, when it became necessary to use a lower gear, on which the vehicle travelled as fast as the tortuous road would permit and climbed to the summit with the greatest of ease.

This completed all the official hill-climbs of the Scottish Trials, so at this point we turned for Edinburgh and home. At the bottom of the "Rest and be Thankful," on our return journey, we met that ardent motorist Lord Shrewsbury, on his peculiar boat-shaped Talbot car, evidently on his way to mount the "Rest and be Thankful" Hill. We duly arrived in Edinburgh, and the next day drove on to Newcastle-on-Tyne, where our friends had some more hills ready for us to try the car on. In the city of Newcastle itself we were taken up a steep gradient which is well known to motorists there as "Bottle Bank," and up which the car raced with ease. Spending the night in Newcastle, the works at Tinsley were safely reached on the following day.

On returning, the motometer showed that the car had covered a total distance of 1,207 miles for the trip, making the total altogether of 4,804 miles that the car had run since first put on the road for testing purposes. During the whole of the trial it was wonderful the way the vehicle was able, without any feeling of effort whatever, to maintain its top gear, and it was only necessary to drop off this when tackling the steepest parts of either the official hill climbs themselves, or such well-known bad bits as Bridge of Avon, Bridge of Brown, and Amulree. All the normal running on the main roads and through towns was easily done on the top speed. The only incidents during the run were the sooting up of one sparking plug and two punctures.

AUTOMOBILE INSTRUCTION.

THE Northampton Institute at Clerkenwell has an excellently equipped engineering section, which includes automobiles in its scope. The day classes are held on Thursdays and also on Saturday mornings, while the evening classes are held on Tuesdays and Thursdays in the design, construction and working of motor-cars, the lecturers and instructors being Messrs. C. E. Larard, D. G. Snodgrass and R. Curtis. The course of thirty lectures begins on the 29th inst. and for advanced students drawing office work and practical design is dealt with on Wednesdays. Laboratory work and workshop practice are also included in the course, a thoroughly practical opportunity for becoming acquainted with the technical side of motoring being given.

The special classes and course of instruction in motor-car driving for mechanics and engineers at the Battersea Polytechnic commences at the end of the present month. These are divided into four classes, including (a) Evening and Saturday classes for chauffeurs, (b) Similar workshop tuition for mechanics, (c) Day college course and preparation for motor engineering, and (d) Special lectures and laboratory work in motor-car engineering. Mr. R. J. Taylor is the lecturer and instructor in driving, Mr. L. H. Hounsfield also lecturing to the motor classes. The Polytechnic possesses a modern 20-h.p. Darracq car, 12-h.p. Mors car, and a two-cylinder 10-h.p. car for demonstrations and tests, the two former being also available for driving lessons.

There are several lectures and laboratory courses at the East London College, Mile End Road, E., suitable for those who wish to study to become automobile engineers. In the heat engine laboratory there are two petrol engines upon which brake trials are run by students at the College. There is also a Campbell paraffin oil engine, a Crossley gas engine and apparatus for determining the calorific value of gas and oil. In design work students make working drawings from their own calculations for motor-car engines. In the strength of materials laboratory research work is at present being conducted upon the strength of vanadium and other special steels used in motor-car work and of aluminium. The importance of a University degree in engineering is now fully recognised, and special facilities are given to students to take such subjects for their degree as will be helpful to them in whatever branch of engineering they may enter.

The syllabus of the Petrol Motor Class at the Borough Polytechnic Institute, 103, Borough Road, London, S.E., is of a practical character. The instructor is Mr. A. Marsden, who is assisted by Mr. W. Hill. Course A includes lectures, drawings and calculations and practical work. Arrangements are being made for students to receive demonstrations upon and inspect a typical car, but it is not at present proposed to teach driving upon the road. Course B will relate to motor-car design, and is for motor engineers and draughtsmen. It is intended to carry out the complete calculations and designs of a modern 20-h.p. commercial lorry chassis.

THE "Perfecto" non-skid of the London Motor Tyre Company, of 9A, Newman Street, Oxford Street, London, W., has attained some distinction. A motorist writes that he obtained one two years ago and that it has stood the test of time.

CASES AGAINST MOTORISTS.

ALLEGED RECKLESS DRIVING.

Lord Newborough's chauffeur, Max Dalloz, was charged at Woking on Saturday with having, at Worplesdon, recklessly driven a motor-car, thereby causing the death of one William Larby, aged 13, who was found dying on the roadside just after a dark green car had passed the spot. He was remanded. At the court Lord Newborough was represented by counsel, who stated that his lordship was staying at Harrogate at the time of the fatality. He had telegraphed expressing his deep sympathy with the relatives, and offering to defray the funeral expenses.

"FAILING TO GIVE INFORMATION."

At Chelmsford on Saturday, Benjamin Wickens, of Cranbrook Park, Ilford, was summoned for failing to give information to lead to the identification of the driver of a motor-car, of which he was the registered owner. Mr. F. P. Sutherly prosecuted; Mr. T. W. Staplee Firth defended. Mr. Sutherly said it was alleged that an offence was committed by the driver of the defendant's car at Chelmsford and Widford, and on August 21st Deputy-Chief Constable Somerset wrote to the defendant asking him to give the name of the driver of the car, who, it was "averred," committed an offence on the day in question. No reply was received to this letter, and on the 25th Mr. Somerset wired to the defendant that, if a reply was not sent, he must proceed for refusal. On the 28th the defendant wrote, stating that he had referred the matter to his solicitor. On the 27th he wrote, stating that there was nothing in the Motor Car Act fixing the time in which the information should be given, and that it would be given within a reasonable time. On the 28th the defendant wrote, stating that no offence was committed by the driver of the car. In this case, however, it was not a question of refusing, but of "failing" to give information. Mr. Firth said the rights of the police had been misconceived. He submitted that the prosecution must fail, because no offence had been proved to have been committed. It was not sufficient merely to "aver" that an offence had been committed. The prosecution had not proved that the driver of the car had committed any offence, and the defendant had not been told what offence was "averred" against the driver. The defendant was fined £5 and costs, £1 6s. Mr. Firth said the case would be taken further, and undertook to produce the defendant's licence when required.

CHAUFFEUR SENT TO PRISON.

Claude Levy, 31, a chauffeur, of East Dulwich, was indicted at the Central Criminal Court for the manslaughter of William Burr, aged 34, of Bethnal Green. The case was tried before the Recorder at the July Session, when the jury disagreed. The prisoner was employed by Mrs. Freshfield, of Hampstead, and on the day in question, June 27th, she gave him permission to use her car. In the evening he went to a theatre at Shoreditch, and there took on board some passengers, and proceeded with them into Bishopsgate Street Without. He had gone a distance of about 700 yards when the car knocked down the man Burr, who died from his injuries. On Monday the jury returned a verdict of guilty, and five previous convictions having been proved, Mr. Justice Pickford sentenced the prisoner to four months' imprisonment in the second division.

BATCHES.

Several batches of motorists have been before the courts during the last few days, notably at Newcastle, Carlisle, Basingstoke, Bridlington, Grantham, and the usual Surrey and Sussex rendezvous.

AT TOTNES.

The Totnes Bench have decided that in future motorists summoned to appear before them shall do so in person. Representation by a solicitor alone will not be sufficient for the magisterial dignity.

ROAD REPORTS.

EASTBOURNE.—A system of finger posts is to be introduced at Eastbourne, which will considerably facilitate the passage of motorists through the town.

WARWICK.—The surveyor to the town of Warwick has been instructed to prepare a plan showing the streets that are dangerous to motor-car traffic, with a view to the application to the Local Government Board for a speed limit through the town.

MAYFIELD.—The East Sussex County Council is applying for an Order restricting the speed of motor-cars along the main road through the parish of Mayfield to ten miles an hour.

COWFOLD.—The West Sussex County Council have applied to the L.G.B. for a regulation limiting the speed of motor-cars to 10 m.p.h. on certain roads in the parish of Cowfold.

PENZANCE.—The Penzance Town Council are making application to the L.G.B. to make regulations fixing ten miles per hour as the maximum speed at which a motor-car may be driven within the area of the borough.

MESSRS. A. J. DEW AND CO., 8, Hart Street, High Holborn, London, W.C., have issued a list of spare parts for De Dion Bouton cars which they can supply.

CLUBS AND ASSOCIATIONS.

ROYAL.

ARRANGEMENTS have been concluded with the L. and S. W. Railway, by which members may now purchase passenger tickets and arrange for the transport of their cars from London or Southampton to St. Malo. A representative of the club has been appointed in St. Malo to give assistance and arrange for the issue of French licences without delay.

Arrangements have also been completed so that members may now obtain French licences in Cherbourg, where up to the present it has been impossible to procure them.

THE MOTOR UNION.

THE Motor Union has recently voted small grants for improvement on the coast road from Branton to Croyle, on the north-eastern side of Barnstaple Bay, and on a road near to West Heslerton village (Yorkshire).

The Union has also contributed 20 guineas towards the cost of further proceedings by the legal advisers of Mr. H. M. Gordon in connection with a case that recently occurred at Lancaster.

AUTOMOBILE ASSOCIATION.

THE Automobile Association Road Department has grown to such proportions that there is no longer room for it in the head offices. The

standard class short championship race similarly restricted and a 90-h.p. race with similar conditions. For the first Mr. J. W. Stocks's 25.6-h.p. De Dion is alone eligible, Mr. S. F. Edge's 39.6-h.p. Napier for the 40-h.p. race, and for the 90-h.p. race the only eligible cars are Mr. S. F. Edge's 90-h.p. Napier and Mr. F. R. Fry's 76-h.p. Mercedes. The sixth 26-h.p. race, fourth 40-h.p., third 60-h.p., and the fifth 90-h.p. races are among the events to be decided at the next Brooklands meeting.

YORKSHIRE AUTOMOBILE CLUB.

ON Saturday last the Yorkshire A.C. held a hill-climbing competition on Greenhow Hill, near Pateley Bridge. A large number of spectators were on the course. The latter has an average gradient of one in twelve, the steepest part being one in six. Weighing in commenced at eleven o'clock, and about two o'clock the first car, the 10-h.p. De Dion owned and driven by Mrs. Guy Barrett, of Horsforth, was despatched, and Mrs. Guy Barrett had the distinction of winning the gold medal for first place in Class A, the second prize winner being Mr. C. Pariah, whose 9-h.p. Sizaire-Naudin was driven by Mr. A. Bell. In Class B Mr. T. H. Woollen's 15-h.p. Talbot, driven by Mr. J. W. Hedge, secured first place, making the fastest time, and Mr. P. C. Kidner's 20-h.p. Vauxhall, driven by the owner, was second. In Class C Mr. T. C. Pullinger's 20-h.p. Beeston Humber, driven by Mr. Rowland Winn, of Leeds, secured first place, and Mr. T. H. Woollen's 25-h.p. Talbot,

The Yorkshire Club's Hill Climbing Competition at Pateley Bridge.—The Scene at the starting point.

department has therefore been transferred to 8, New Coventry Street, London, W.C., where all communications with reference to patrols, applications for agencies, positions, &c., should be addressed.

ROADS IMPROVEMENT ASSOCIATION.

ON Wednesday a meeting of the council of the Roads Improvement Association (Incorporated), was held at 7, Albemarle Street, London, W., when reports were presented with regard to the forthcoming International Road Congress, and as to various tests lately conducted with regard to the dust nuisance.

BROOKLANDS.

THE programme of races to be run on the Brooklands track on Saturday, the 3rd prox., includes the 5th all-comers' handicap sweepstakes, the October sweepstakes, the Large October sweepstakes, an obstacle race, a motor-cycle handicap and the Brooklands Grand Prix. Entries for all these events close at mid-day on the 28th inst.

The other events on the programme are the 1908 26-h.p. standard class short championship race for winners of any previous 26-h.p. race who have not competed in any subsequent race of that class. A 40-h.p.

driven by Mr. T. H. S. Atkins, of Leeds, was placed second. In Class D Mr. Albert Farnell, of Bradford, drove his 30-h.p. Daimler car to victory, the second prize falling to Mr. E. G. Cundy, of London, who, on a 60-h.p. Napier, made the fastest time of the day.

MOTOR-CYCLE SPEED TRIALS.

SPEED trials under the auspices of the Dublin and District Motor-Cycle Club were held at the Velvet Strand at Portmarnock on Saturday. Two of the races were won by R. H. Taaffe, while the third was secured by N. J. Chambers, the hon. secretary of the club. Mr. T. W. Murphy acted as timekeeper and starter. The placed men in each of the races were as follows:—

Two Miles Handicap.—R. H. Taaffe (Triumph), 30 sec. start, 1 N. J. Chambers (F.N.), 40 sec., 2; H. J. Wilson (F.N.), 50 sec., 3. Won by 21 sec., a poor third. Winner's net time, 3 min. 9 sec.

Four Miles Handicap.—N. J. Chambers (F.N.), 1 min. 30 sec. start, 1; R. H. Taaffe (Triumph), 20 sec., 2; T. W. Batey (F.N.), 1 min. 30 sec. start, 3. Won by 10 sec.; 49 sec. between second and third. Winner's net time, 7 min. 2 sec.

Six Miles Handicap.—R. H. Taaffe (Triumph), 10 sec. start, 1; F. J. Walker (Rex), scratch, 2; T. W. Batey (F.N.), 1 min. 50 sec., 3. Won by 11 sec.; a poor third. Winner's net time, 8 min. 58 3-5 sec.

NORTHAMPTONSHIRE.

THE speed trials of the Northampton A.C., which were to have been held on the 10th inst. on the drive of the Marquis of Northampton's Park at Castle Ashby, were abandoned owing to an unfortunate mishap which occurred a few moments before the time at which they were to have started. Two vehicles, one driven by Mr. Moreham, of Spratton Hall, the other owned by Mr. W. E. Wren, of Northampton, collided, both vehicles being badly damaged and Mr. Wren sustaining injuries that necessitated his removal to the hospital at Northampton.

MOTOR CYCLING CLUB.

THE annual M.C.C. petrol consumption trial was held at Gerrard's Cross on Saturday last. Thirty-two competitors faced the starter, Mr. S. J. Sewell.

The Car class was won by J. Platt Betts on an 8-h.p. Rover. He covered 19 miles on his allowance of petrol, equalling 47½ miles per gallon. J. van Hooydonk, 8-h.p. Phoenix, was second, doing 16 miles, and H. Fuller, 6-h.p. Piccolo, third with 15 miles to his credit. A gold, silver and bronze medal will be awarded to the above gentlemen, subject to confirmation by the committee. F. J. Jenkins, 20-h.p. Rover; G. A. Phillips, 10-12-h.p. Humber; F. C. Dee, 8-h.p. Rover; R. G. Booth, 15-h.p. Buick; E. A. Anthony, 15-h.p. Ford; J. Cozens, 10-h.p. Lagonda tri-car, finished in the order named.

The Motor Bicycle class was won by G. L. Fletcher on a 2-h.p. Moto-Reve, who will receive a gold medal. W. Smith, 2-h.p. Moto-Reve, was second, silver medal, and A. G. R. Slingo, 6-h.p. Griffon, third, bronze medal.

A storm delayed the start, causing the roads to be very heavy and making the winner's performance all the more meritorious.

Messrs. Camparole, R. M. Brice, R. C. Davis, E. D. Dickson, S. H. Fry, Robert H. Head, and S. J. Sewell have to be specially thanked for their valuable assistance.

THE Southern M.C. will hold a hill climb on the 27th inst., the competitors being divided into five classes.

A MOTOR CLUB for owners of motor-cars as well as motor-cycles has been formed at Ashton-under-Lyne, with Mr. Ellis Brooks as hon. secretary.

TWENTY-ONE new subscribers and six new members were elected at the last committee meeting of the Cycle and Motor Trades Benevolent Fund. A bank balance of £475 was reported.

THE motor gymkhana of the Lancashire A.C. attracted about 300 people, and twenty-four competitors participated in the sports. Mr. A. Birtwistle, J.P., was the hon. secretary of the meeting.

BY the kindness of the Earl of Devon (a vice-president of the club) a meet was held at Powderham Castle on Saturday, the 5th inst., when over forty cars were drawn up in the beautiful old castle yard.

AT the invitation of Mr. and Mrs. Geo. H. Hodgson, a garden party was held on Saturday afternoon at Hexton Manor, to which the members of the Hertfordshire County Club were also invited.

IN the Yorkshire A.C. closed hill climb at Pateley Bridge, on Saturday, the fastest time was made by a Dunlop-tired six-cylinder Napier, whose performance lowered the record for the ascent by five seconds.

THE CARE OF MOTOR-CAR BODIES.

THE following hints as to the maintenance of the paint work, bright parts and upholstery of motor-car bodies are taken from the book of directions issued by one of the best known French body builders. With regard to paint work, after the car has been out on a run it should be washed immediately upon its return to the garage, as mud and dirt will affect the paint if allowed to cake upon it. Starting with the mudguards and wheels, these should be hosed to loosen the mud, which can then be removed by means of a spoke brush. The stream from the hose should not be fierce, but only of sufficient strength to soften and loosen the mud. If a strong stream is allowed to strike the paint work upon a wooden body the panels will be swelled, developing cracks and seams, and the paint will flake off, to the detriment of the appearance and service of the body. The latter should next be lightly run over with a dripping sponge to remove dirt, &c., and then with a clean wet chamois leather, after which it is dried by means of another clean dry chamois. Under no circumstances should petrol, paraffin or siccatives of any nature be mixed with the water, as they are harmful to the surface of the paint. Dust can be readily removed by means of a feather duster used for the purpose.

Care should be taken when using the hose to avoid wetting the spare tyre cases and the various pockets and receptacles, on account of the tendency to rot and crack them. A damp cloth followed by a dry one should be used for cleaning these. The splashing of water from the hose into the interior of the body should be avoided. Stains and small scratches can be removed by the application of a preparation obtainable from coachbuilders, this being applied by means of a pad of cotton wool and dried up by a similar clean pad.

The interior of the car should always be neat and clean; the carpets, therefore, should be removed and beaten after each trip, and the hangings carefully brushed with a silk or other soft brush. Leather upholstery should not be washed, but simply well wiped off; brocades should be given over to the coachmaker, and their cleaning not be attempted in the garage, as the use of benzine and other stain removers tends to cause the material to become streaky. Grease spots may be treated by the

application of petrol and removed by rubbing when dry. Floor boards should be examined as to their fit, whether they have warped, &c., as, if they show cracks or spaces between them, the heat and odour of the motor, mud, and even grease may get into the car. When the body is of the landaulet type it is essential that the leather head or heads should always be kept closed when in the garage, to prevent cracking and bulging. As soon as the car has returned from a run the head should be closed and wiped over with a flannel dampened with linseed oil. A thorough washing with the oil should be given to the head once a month as well.

All bright work, such as lamps, horns, rails, &c., of copper, brass or nickel plating, should be taken special care of, polishing powder or fluid being applied immediately after the parts have been wiped dry with a flannel, as soon as the car is in the garage. The parts are then polished with a soft flannel or other polishing cloth. Oxidised or silver plated parts should be lightly wiped with a chamois or clean flannel and not rubbed briskly. Rubber foot mats, treads on the steps, &c., should be scrubbed with water and black soap, using a stiff scrubbing brush, and afterwards wiped dry with a cloth. To prevent their decay, particles of oil and grease thereon should be immediately removed, but not with petrol or the like, as this rots the rubber.

When a tyre bolt or mud guard is removed the paint at the junction is broken; this should be renewed, when the operation is completed, by means of a camel's hair brush and the necessary paint, which can be obtained from the coachbuilders.

COMPANY NEWS.

E. W. WILLARD AND CO.—This company has been registered, with a capital of £2,500, to acquire the business of a motor accessories factor and manufacturer, carried on by E. W. Willard at 187, Newhall Street, and 32, Paradise Street, Birmingham. The subscribers are Messrs. E. W. Willard; R. C. Willard, and P. H. Johnson.

THE BERNA COMMERCIAL MOTORS, LTD., with an authorized capital of £50,000, has been formed in Toronto, Ontario, to acquire the selling rights of the Berna Commercial Motors for Canada, the United States and Mexico.

THE second annual general meeting of the General Motor Cab Company (Limited) took place on Monday under the presidency of Mr. Davison Dalziel. At the present moment, he said, they were running on the streets (including those taken over from the United Motor Cab Company) nearly three times as many cabs as the average number which earned such good profits for the period to July 31st, and that number would naturally be materially increased until the whole of the 4,000 cabs they would own should be in use. The directors had fully gone into the question of depreciation, and it was amply met by the charging of all up-keep and maintenance to revenue, and the setting aside of one-sixth of the value of the average number of cars in use each year until their total value had been set aside. Unless the whole question of garaging and up-keep could be dealt with upon a comprehensive scale, no motor-cab company could be made to pay in London. The arrangements for taking over the United Motor Cab Company had been completed, and since August 1st that concern had been worked for the benefit of the General Motor Cab Company. In the course of a few days the liquidator of the United Company would be in a position to announce the distribution of the dividends accruing to the shareholders of that company, when an exchange of shares would forthwith follow, and the amalgamation be concluded. By that amalgamation the capital of the company had been increased to £1,000,000, with 1,000,000 shares of £1 each, and the directors had under consideration the possibility of asking the shareholders to approve the conversion of these million £1 shares into 200,000 shares of £5 each, or 250,000 of £4 each, one of the reasons being to meet the wishes of the French market, where the shares were already actively dealt in. The company's interest in and friendly alliance with the Provincial Motor Cab Company were of a most satisfactory character, and that company was successfully running motor-cabs in Manchester, Sheffield, Leicester, Harrogate, Bristol, Brighton, Bournemouth, Folkestone, and Aldershot, and was on the point of opening in Liverpool, Glasgow, Edinburgh, and other large towns. Mr. Edgar Cohen seconded the motion and the report was adopted.

PUBLIC SERVICES.

At the forty-ninth annual general meeting of the London General Omnibus Company it was reported that the number of omnibuses running was 1,336, the mileage run was 32,176,100, and the number of passengers carried was 195,894,900, the latter a decrease of over 12,000,000. Mr. Henry Hicks, the chairman, said they had gone in for motor-buses unwillingly, but having done so they were determined to keep up to the mark. He hoped that the contemplated amalgamation would result in economies that would act favourably on the future results.

AN application for the introduction of the electro-buses into Harrogate has just been made to the authorities.

A SERIOUS accident is reported from Alsackby, a village on the main road between Lincoln and Peterborough, a car overturning while running up a steep embankment; the passengers, two ladies and two gentlemen, being seriously injured.

FORTHCOMING EVENTS.

SEPTEMBER.

- 19th (Sat.).—Provincial meet of the Motor Union at Oxford. Sheffield and District A.C. hill climb at Padley Wood, Grindleford.
 North Middlesex A.C. 100 miles reliability run.
 Meet of the Hull Auto Cycle Club and the Lincolnshire Motor Cycle Club at Brigg.
 Lunch of the Kent A.C. at Dover.
 L.G.B. inquiry into application of the Bangor Town Council for a restriction of motor-car speed.
 Lancashire A.C. closed speed trials.
 22nd (Tues.).—A.C.U. International Auto-cycle Tourist Trophy Race, Isle of Man.
 Last Practice Day for Isle of Man Race; weighing of competing cars, 10.30 a.m.
 23rd (W.).—"Graphic" Trophy (10 a.m.) and "Henry Edmunds" Competitions (2.30 p.m.) in the Isle of Man.
 24th (Th.).—The "Four Inch" Race organised by the Royal A.C. in the Isle of Man.
 25th (F.).—Welsh A.C. reliability trial for motor-cycles.
 26th (Sat.).—N.W. London M.C.C. petrol quantity judging competition.
 Invitation to the Kent A.C. by Mr. and Mrs. Schlentheim to Chislehurst.
 Examination for R.A.C.'s driving certificates at the Adelphi Hotel, Liverpool.
 27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

OCTOBER.

- 3rd (Sat.).—Brooklands A.R.C. meeting.
 4th (Sun.).—Gaillon Hill Climb.
 11th (Sun.).—First International Road Congress and Exhibition opens at Paris.
 International long distance balloon race, starting from Berlin.

NOVEMBER.

- 6th (F.).—Invitation Smoking Concert of the Stanley Cycling Club at the Queen's Hall, London, W.
 14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club, Hotel Metropole, London, S.W.
 20th-28th.—Stanley Show at the Royal Agricultural Hall, London, N.
 26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.
 28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

- 23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces, India.

LIGHTING-UP TIMES—LONDON.

| | | | |
|---------------|-----------|-----------|-----------|
| Sep. 19th—7.5 | 21st—7.1 | 23rd—6.56 | 25th—6.52 |
| " 20th—7.3 | 22nd—6.59 | 24th—6.54 | 26th—6.49 |

To find the approximate lighting-up time in September for Birmingham 9 minutes should be added to the above times, 8 for York, 13 for Manchester, and 25 for Glasgow.

POLICE "CONTROLS."

MOTOR traps leading to Hailsham Petty Sessions have been established at Chiddingfold and Farmfield, the police being stationed near the Pear Tree Inn at the latter place. The control at Rottingdean is also in frequent operation.

THE Oakham police have established a trap of a quarter of a mile at Great Casterton.

THE Yorkshire traps recently reported include one at Fryston Park Corner, near Selby.

THE police are paying considerable attention to the speed of motor vehicles ascending Shilton's Hill, near Retford, observing the district from a position of vantage at Carolgate Bridge.

POLICE traps have lately been reported on the road between Glenshee and Blairgowrie.

THE Boroughbridge road, near Knaresborough, is again the scene of active police operations against motorists.

A POLICE TRAP is frequently in operation on the road between Melbourne and Cambridge.

THE police have established several motor traps in the vicinity of Camborne.

LINCOLNSHIRE controls lately reported include those between Long Bennington and Great Gonerby (4 miles), South Witham and Colsterworth (2½ miles), Great Ponton and Spittlegate (2½ miles), and Foston and Long Bennington (4 miles).

MESSRS. MINERVA MOTORS, LTD., have acquired the Belgian rights in the "Silent Knight" valveless engine. A 38-h.p. chassis embodying the new engine will be exhibited on the Minerva stand at the forthcoming Olympia.

THE RUBBER EXHIBITION.

AT Olympia, London, there is in progress, and will continue till the 26th inst., a Rubber Exhibition which is serving a great educational purpose, acquainting the public with the methods of cultivating and enlarging the view as to the utility of the finished product.

The India-rubber, Gutta Percha and Telegraph Works Company, of Silvertown, E., show models of motor tyres, including the Persian and the rubber-tread, Palmer cord, as well as examples of india-rubber matting and floor covering. Several machinery exhibits are on view, one of the most interesting being that of Messrs. David Bridge and Co., of the Castleton Ironworks, Castleton, Manchester, who have an electrically driven washing and sheeting machine in connection with which the Heywood and Bridge's improved patent clutch is employed to demonstrate how easily rubber machinery can be put in and out of gear. Their machinery is to be found on the leading rubber plantations, the firm having laid themselves out specially for this particular branch. They are able to deal with all species of rubber in a satisfactory manner in the washing, sheeting, crepeing, drying and blocking process, thus enabling the exportation of rubber in a pure state from the rubber growing countries. Messrs. Fleming, Birkby, and Goodall, Ltd., 39, Lime Street, London, E.C., have a representative exhibit illustrative of their "Teon" belting for power transmission. Ara, Ltd., have also a stand.

Latterly the "Prowodnik" tyres have come well to the front in this country, and considerable interest attaches to the Prowodnik Reclaimed for goloshes. This contains 40 per cent. of rubber and is going largely into use, Mr. John Lang, of 137, Fenchurch Street, E.C., being the selling agent in London. Messrs. John Bright and Brothers, Ltd., of Rochdale, show cotton ducks for motor tyres and the New Motor and General Rubber Company, Ltd., of Harpenden, has a good display. Another exhibit of motorial interest is that of Mr. A. W. Leslie, the well-known dealer in motor tyres and scrap rubber, of 119, Stoke Newington Road, London, N. Messrs. Piggott Bros. and Co., Ltd., 57-59, Bishopsgate Street Without, London, E.C., show their camp furniture and tents, and Messrs. Diespeker, Ltd., 57-60, Holborn Viaduct, E.C., display the Dunlop rubber tiles which they have supplied to many famous vessels and popular institutions.

BUSINESS NEWS.

MR. GEORGE TAYLOR, of All Saints' Street Works, Bolton, has recently put on the market a patent pressure indicator known as the "Okillo," for internal combustion engines. The device can be readily attached to the cylinders, and accurately records the actual explosion and compression pressure.

THE PETER UNION TYRE COMPANY, LTD., of 6, Upper St. Martin's Lane, W.C., has opened a Midland branch at 160, Corporation Street, Birmingham, where a stock of Peter Union pneumatic tyres will be kept.

WE are informed by Messrs. Clement-Talbot, Ltd., that they are now offering for sale the Talbot cars which have been used by them for contest work during the year. Among these vehicles are the 15-h.p. and 25-h.p. which came through so satisfactorily and successfully in the 2,000 miles trials, winning the silver cup in Class F; also the 15-h.p. car used at Saltburn, where it won the Yorkshire A.C. trophy, and afterwards distinguished itself so conspicuously at Astor and Newnham hill-climbs, &c.

MESSRS. J. KEELE AND CO. have now on view at their depot at 72, New Bond Street, London, W., the 1909 models of Belsize cars, trials on which can be arranged.

COINCIDENT with the information given in our last issue in respect of the establishment of an English agency for the Belgian "Imperia" cars in Great Russell Street, London, W., comes the information of the success of a 22-28-h.p. car of this type at the Mont Ventoux hill climb held in France last week end, the vehicle climbing the hill in 24 min. 7 sec.—the fastest in its class.

THE Motor House have made arrangements with the makers to supply them with 200 Jackson light cars fitted with De Dion motors for the coming season. Deliveries will commence in November, and cars for trial runs have already been received by the Motor House in Euston Road, N.W., which intends to dispose of these vehicles at a price which will enable them to reach many who have hitherto had to keep outside the ranks of motorists.

At the Yorkshire A.C. Hill Climb at Pateley Bridge on Saturday last, Mr. T. H. Woollen's 15-h.p. Talbot was again remarkably successful. In addition to making fastest time in Class B it secured first prize on the formula. This is probably the last competition in which a Talbot car will take part during Mr. Woollen's tenure of office as general manager to Clement Talbot, Ltd., and it is gratifying to note that his car has been so conspicuously successful on this occasion. It is doubtless the spirited enthusiasm which Mr. Woollen has all along displayed, and has inspired in those around him, in these events, that has contributed largely to the continuity of Talbot successes.

THE Motor-Car Journal.

VOL. X.]

COMMENTS.

The Week End at Brighton.

OUR Brighton correspondent writes:—
“Last week end, with its renewal of summer weather, brought forth interesting proof of the establishment of a new régime, for I was informed during the course of Sunday that all of the hitherto known police traps along the main road from London to its favourite seaside suburb had been temporarily abandoned, with the exception of one at Haywards Heath—a sign, apparently, of the willingness of the police authorities to test the sincerity of the crusade of reformation to which the R.A.C. has pledged itself. As a consequence the motoring traffic into Brighton was thicker than I have known it for many months past. The luncheon tables of the Metropole and Royal York were gay as gay could be, and up and down the Front the whirl of cars of all shapes and sizes was animated and incessant enough to suggest the marshalling of some big motor gymkhana. Among those calling at the Metropole were Mr. Alfred Rothschild, driving a beautiful Renault of imposing strength and dimensions; Mr. Abrahams and Mr. Bellisoe, each with a Darracq; Mr. Knox and Mr. Beck with Argylls, Mr. Brown (Mercedes), Mr. Edgar (Napier), and Mr. James (Mercedes). To identify a tithe of the Sunday visitors, who merely run their cars into a garage for an hour or two, and fetch them away without bothering to register the ownership, is, however, a matter of impossibility in a town like Brighton. But among the people whose fleeting presence at one or other of the best hotels I did hear of were Mr. Greening (Humber), Mr. Clase (Standard), Mr. Grace and Mr. Howlett (Darracqs), Mr. Randolph Barnes, with a particularly fine Napier, Mr. Acklam (La Buire), Mr. Cridlan and Mr. Cooper (Minervas), Mr. Peall (Panhard), and Mr. V. V. Schaposchinskioph—a gentleman whose imposing name I insisted on having carefully spelt over to me two or three times—with a handsome Renault.

The L.G.B. Circular.

THE circular which we were recently able to announce as being in preparation at the Local Government Board has just been issued to the County Councils and to the Town Councils of boroughs with a population of over 10,000. This recognises that there is ground for some of the complaints that have been made, and places on official record the existence of the inconsiderate driver. At the same time they note a growing desire among motorists to check the abuses that have been alleged, and before dealing with the representations which have been made as to further legislative restrictions being imposed on cars, have thought well to direct the attention of local authorities to those provisions of the existing law which have a bearing upon the subject of motor-car driving. These are contained in Sections 1, 8, 9, and 11 of the Motor Car Act of 1903, and they are considered at some length in the circular from the L.G.B. They suggest that the provisions for the suspension of licences and the conviction of reckless drivers should be carefully and systematically enforced, and in particular that racing on the public highways, especially by motor-buses in London, should be rigorously suppressed.

Importance of Section 1.

ALTHOUGH the Board thus calls the attention of the local authorities to the methods by which motor traffic can be dealt with at present, they do not encourage applications for the imposition of low speed limits. They would, in fact, prefer to see motor traffic regulated under Section 1 of the Act, where such is possible, and are convinced that a steady and systematic enforcement of that section would prevent the flagrant abuse of the highways by drivers. Thus it would seem that they are inclined to the abolition of the speed limit altogether, and would rely for convictions on the “reckless, negligent, and dangerous driving” rather than by the methods pursued by some of the police to trap motorists. We are glad to notice that the circular also emphasises the part that the local authorities can play in connection with this matter. Their whole duty does not consist in suggesting to the police a more watchful attitude towards motorists, but they should use “every effort to diminish the risk of accidents.” Where there are dangerous corners advantage should be taken of a suitable opportunity to obtain their removal where practicable; street corners in towns should be rounded and in rural areas pruning hedges should be undertaken in cases where, by obscuring the view, they constitute a danger to traffic at cross roads. In some instances it might be found possible, considers the Local Government Board, to arrange for open fences being substituted for hedges, while they cannot but think that centre posts in connection with tramways and light railways, electric and other standard lamps should if possible be avoided.

Restricted Speed Limits.

AN important section of the circular is that which gives the official view with regard to the authorisation of speed limits. It has been widely recognised “that motor-cars can often travel with safety at a speed exceeding ten miles an hour, and that for a careful and considerate driver who drives his car slowly through towns and villages, and when passing other traffic or pedestrians restricts his pace so as to avoid enveloping them with dust or bespattering them with mud, a compulsory low speed limit is scarcely ever necessary.” Unfortunately, however, all drivers are not of such exemplary character. It is pointed out that such speed limits are more suited for application to lengths of road or street than the isolated points of danger, the latter being more appropriately marked with danger signals. In some country towns extra precautions are necessary on market days and special occasions, and it might often, according to the Local Government Board, be best met by constables on point duty rather than by restrictions of speed to be observed at all times.

The Four-Inch Race.

THERE is no doubt that the opinion expressed by Mr. Joynson-Hicks at Oxford on Saturday with respect to the race for the Tourist Trophy is the view of many motorists who have followed the course of public opinion during recent months. The times attained by the cars during the practising days have alarmed many people, who have wondered

whether these "touring" cars capable of speeds far beyond the legal limit are to be frequently met on the road during the next season. They do not look forward to such a prospect with pleasure, and will feel much sympathy with the speech of Mr. Hicks.

The Motor Trade in India.

THE somewhat glowing account of the prospects of business with motor-cars in Bombay, which was recently published in an English journal, has brought forth a rejoinder from the "Indian Motor News," from which it would appear that India is not at present the El Dorado that we have been led to believe. "Indeed," writes our contemporary, "the opposite is the case. Several motor-car firms at home have considered that India is a good dumping ground for their surplus stock, and they have ruthlessly consigned to this country cars which they could not sell elsewhere, and the majority of those cars are still here. All the importing firms are overstocked, as buyers are fewer this year than last. Many manufacturers at home have been led away by the imaginary boom of cars in India, and have appointed agents who have meant well, but have in the majority of cases done little business. It is estimated that at the present moment there are some 200 new cars in Bombay for sale. Of

Touring in Sweden.—The Harbour at Sundsvall.

course, matters will improve after the monsoon, as there is no doubt that there are a large number of prospective purchasers for next cold weather."

Police Traps in Perthshire.

IN a recent issue we called attention to the number of convictions that were being recorded against automobilists in Perthshire, and suggested the advisability of chauffeurs and others contesting these cases. Since then the wisdom of that suggestion has been exemplified by a noteworthy discovery. A police trap was laid on a mile of the public road between Newton of Logierait and Knockintober, and a local motor-car driver was reported for exceeding the speed limit. He challenged the accuracy of the police authorities regarding the distance, which, judging by the speedometer on his car, he considered short. Before taking proceedings it is understood the police requisitioned the services of the Highland district road surveyor and had the mile measured, with the result that the actual chain measurement disclosed a deficiency of 218 yards! Needless to say, no further proceedings were taken in this case; at the same time it discloses an extraordinary state of affairs. It has always been asserted that in Perthshire there are long miles and short miles, and in cases where prosecution is intimated it is now absolutely necessary, in the interests of motorists themselves, that they should have the distance accurately measured. The speeds

in the majority of the prosecutions have ranged about twenty-five miles an hour, so that it will be seen a question of a few seconds and a slight shortage in the mile makes all the difference in the world.

Motorists and Cyclists.

JUST as magistrates laugh at the absurdity of giving a blind man a licence to drive a motor-car, so, in lesser degree, might the folly of really deaf persons riding bicycles nowadays cause a smile. But they do; and hence the wisdom of the C.T.C.—which seems to have become the possessor of a Roneo—in suggesting to those thus afflicted the advisability of affixing to the back forks of their machines two red and white semi-circular discs. If this signal becomes understood and recognised by users of the road, deaf cyclists would have the assurance that their affliction will not endanger their lives. In addition to notifying the Press, the C.T.C. might suggest to the A.A. the advisability of asking their scouts to warn their members of the presence of such discs on the road ahead. The idea is a good one; but we are afraid its object will be somewhat difficult of attainment. The fact that we have given it publicity, however, shows our practical sympathy in the matter.

Club Life.

AGAIN, at this season of the year, when the evenings have perceptibly shortened and the dull days are coming along, we renew our annual invitation to the motoring clubs in the provinces to acquaint us with the leading features of their winter programmes. Possibly some of them may find it an effective means of conciliating public opinion by organising discussions, to which public men of the locality—irrespective of their possession of motor-cars—are invited. The moral effect of such work universally carried out would be great.

An all-round Adviser.

AT the luncheon of the Easingwold Agricultural Society, Lord Londonderry, himself the owner of several motor-cars, has been lecturing to agriculturists and motorists alike. To the former he pointed out the value the automobile might be in farming operations, whilst in industrial districts "the motor-car was a great convenience in conveying working men to and from their work." Motorists were urged to proceed with "care, caution and courtesy," the local authorities were advised to urge a return to the turnpike system, and the police were recommended to attend to their own business rather than the pastime of setting motor traps in which to catch travellers by the road. We are afraid, in his endeavour to advise everybody, Lord Londonderry has satisfied no one. It might be well if speakers at such functions would confine themselves to a few obvious pleasantries or take the opportunity of emphasising the actual fact that the progress of the motor-car is inevitable.

Inflaming the Public Mind.

ANOTHER instance of how the public mind is incensed against motor vehicles occurred last week, when several London papers came out with startling lines on their placards as to a "motor tragedy" in which one person was killed and several injured. The accident, sad as it was, could, however, by no means—other than the vivid imagination of the placard compilers of a daily paper—be attributed to the automobile. As a matter of fact, the mishap illustrates the obvious dangers of horses in connection with traffic in crowded places. A cabhorse was quietly standing on the rank by the side of Paddington Railway Station when, slipping its bridle and nosebag, it suddenly made off down the street. Missing some mail vans outside the local post office the horse ran into Praed Street and

there dashed into a motor-bus, knocking down three or four people who were preparing to mount the vehicle. One of the passengers was struck on the back of the head and succumbed within a few minutes. Others were injured, and only the horse seemed but little the worse for the encounter. The fact that a motor-bus was concerned, although the cause of the escapade was a horse, did not worry the newspaper man, who at once described it as one of those tragedies for which the motor-car is responsible.

Illegal Speed Notices.

SEVERAL times have we referred to suspicions of restricted speed limits being notified at various English villages, and have drawn attention to the same. Now we are glad to learn that the Motor Union have discovered other instances of the same kind, and, satisfactory to relate, have been able to secure their removal. The cases in question were at Stairfoot and Burnley-in-Wharfedale, Yorkshire. The Motor Union having been in communication with the Yorkshire County Council on the subject, has received a reply saying that the attention of the Urban Councils in question is being called to

Corporation step-ladder, which when erected has a platform on top. From this standpoint the signs were removed—to the amusement of the onlookers. When the last trader was visited it was found that the first whose signs had been prohibited was re-erecting his motor sign, and ere long new signs had appeared in most instances. Everyone in Devizes is wondering what will happen now that the municipality has thus been set at defiance.

The Great Cab Battle.

MR. G. K. CHESTERTON, who is as prolific in paradoxes as an orchard in leaves at this season of the year, has been writing on the great cab crusade in connection with which he threatened to publish a work of fourteen volumes on "The Cab in All Ages." He describes an alleged debate between the motor-cab drivers and those who adhere, from force of habit as well as circumstances, to the driving of horse-drawn vehicles, and chronicles a pitched battle between a battalion of motor-cabs and a battalion of hansoms. Writing in the style of the "Battle of Dorking" and other volumes with which a past generation was amused, Mr. Chesterton describes the final stage of the conflict as follows:—"It was supposed at first that the superior force and impact of a motor

The Dennis Petrol Motor Fire Engine at Weybridge.

the illegality of the notices, and they will doubtless be removed without delay.

Motor Signs at Devizes.

A VERY amusing dispute is now in progress in the town of Devizes, and, although the matter is of purely local concern, it may be of national interest. Throughout the country it is the custom for motor agents, vendors of petrol and motor oils and the like requirements for motorists, to "hang their banners on the outward walls." These signs are sometimes of artistic effect, often of a very glaring description, and generally could be improved upon with advantage. But they serve the utilitarian purpose of acquainting travellers with places where they can be supplied with their wants. So far they have been tolerated in all the cities of the kingdom, but now the Wiltshire town of Devizes has drawn attention to itself by ordering the withdrawal of such signs from the streets of the borough. The Order has just been issued, on the authority of a regulation dating from the time of Charles I. But the traders did not comply, and the Borough Property Committee thereupon instructed the surveyor to take the signs down. Accordingly he set forth with a number of sturdy workers, armed with the

could always crush another cab; but in this, as in so many other cases, the experts were found to have made a miscalculation. The cabmen from Hammersmith Broadway, enrolled under the name of The First Chiswick Charioteers, soon adopted a manoeuvre which was entirely successful at the battles of Brompton and Sloane Square, and was only with difficulty evaded even on the tragic field of Clapham Junction. They trained their horses to swerve so as exactly to avoid the rush of the motor, and then, rearing on their hind legs, to kick out the brains of the chauffeur: a trick that seldom failed," but rarely happens outside the range of Mr. Chesterton's writings.

ONE of the "Dennis" motor-buses belonging to the Cardiff Tramways Company, Ltd., has recently been fitted with a novel speed controller devised by Capt. Beattie and Mr. R. J. Sully and put on the market by Sully's (Cardiff) Ltd., of Penarth Road, Cardiff. The device, which is driven off one of the shafts of the car, is arranged to ring an electric bell when a speed of twelve miles per hour is attained and give audible warning to the driver; when thirteen miles is reached the governor short circuits the ignition, so stopping the engine until the speed is reduced.

The "Four-Inch" Race.

(FROM OUR OWN CORRESPONDENT.)

The "Four-Inch" Race in the Isle of Man.—A View of Douglas Promenade.

DOUGLAS, Monday.

THIS is the week of the International "Four-Inch" Race for the Tourist Trophy—to give the event its full official title as decreed by the R.A.C. It was founded "for the purpose of encouraging the development of the touring car of the horsepower required by the ordinary user as opposed to the racing car." In previous years there has been a limitation in respect to the fuel allowed by competing cars; but on this occasion a different basis has been established, the fuel consumption being discarded as a factor in the race and the bore of the cylinders limited to four inches.

This year there are thirty-eight entrants, and nearly all are probable starters. The three previous events have resulted as follows:—

| | Starters. | Finished. | Winner. | Speed. |
|------|-----------|-----------|--|-----------------|
| 1905 | ... 42 | ... 18 | 18-h.p. Arrol-Johnston ... (Mr. G. S. Napier) | ... 33.9 m.p.h. |
| 1906 | ... 29 | ... 9 | 20-h.p. Rolls-Royce ... (Hon. C. S. Rolls) | ... 39.5 m.p.h. |
| 1907 | ... 22 | ... 2 | 20-h.p. Rover ... (Mr. E. Curtis) | ... 28.8 m.p.h. |

In 1905 Mr. Percy Northey was second on a 20-h.p. Rolls-Royce; Mr. Norman Littlejohn, on a 14-h.p. Vinot, third.

M. Bablot, on a 22-h.p. Berliet, was second in 1906, and Mr. A. Lee Guinness third on a 15-h.p. Darracq.

Last year only two finished, Mr. J. Reid being second on a 15-20-h.p. Beeston-Humber.

Among this year's drivers who participated in the 1907 event are Messrs. E. J. C. Roberts, A. Lee Guinness, L. Coatalen, O. Cupper, M. Porporato, J. E. Hutton, J. Reid (second last year), K. Lee Guinness and T. Rimmer. Mr. A. E. George, who now drives a Darracq, steered an Argyll in the 1906 Race. The order of starting this year, which will be at half-minute intervals, is as follows:—

| No. of Starter. | Name of Car. | Driver. |
|-----------------|------------------|------------------|
| 1 | Rover... | H. B. Browning |
| 2 | Hutton | W. Watson |
| 3 | Arrol-Johnston | E. J. C. Roberts |
| 4 | Darracq | A. Lee Guinness |
| 5 | Coventry Humber | G. W. Brown |
| 6 | Hillman-Coatalen | L. Coatalen |
| 7 | Metallurgique | Oscar Cupper |
| 8 | Berliet | M. Porporato |
| 9 | Thornycroft | G. V. Baxendale |
| 10 | Vinot... | M. Ross Browne |

| No. of Starter. | Name of Car. | Driver. |
|-----------------|------------------|-------------------------|
| 11 | Calthorpe | Leslie Porter |
| 12 | Deasy | P. Graham |
| 13 | Westinghouse | A. Gaal |
| 14 | S.C.A.T. | R. O. Harper |
| 15 | Hutton | J. E. Hutton |
| 16 | Arrol-Johnston | D. Resta |
| 17 | Darracq | A. Rawlinson |
| 18 | Beeston-Humber | J. Reid |
| 19 | Hillman-Coatalen | K. L. Guinness |
| 20 | Metallurgique | J. T. C. Moore-Brabazon |
| 21 | Berliet | |
| 22 | Thornycroft | D. S. Hodge |
| 23 | Vinot | T. R. Outhwaite |
| 24 | Calthorpe | J. Robinson |
| 25 | Deasy | E. W. Lewis |
| 26 | Westinghouse | J. Gaal |
| 27 | S.C.A.T. | F. Ward |
| 28 | Hutton | P. D. Stirling |
| 29 | Arrol-Johnston | G. Moss |
| 30 | Darracq | A. E. George |
| 31 | Beeston-Humber | T. C. Pullinger |
| 32 | De Dion Bouton | J. W. Stocks |
| 33 | Metallurgique | Warwick Wright |
| 34 | Piccard | Andre Debuissy |
| 35 | Thornycroft | Tom Thornycroft |
| 36 | Vinot | L. Molon |
| 37 | Vulcan | T. Rimmer |
| 38 | S.C.A.T. | H. S. Buckley |

For the first time every driver this year will be medically examined before he starts in the race, so that the physical fitness of those who take part in the event shall be assured—as far as is humanly possible.

The complete circuit of the course is $37\frac{1}{2}$ miles, and as the cars will be required to make nine rounds, the total distance to be covered is $337\frac{1}{2}$ miles. The start will take place at 9 a.m. on Thursday at Ballaskilly. Thence the cars will go to Ballacraigne, where they will leave the course of last year's race and go northward to Kirkmichael. Then the previous track will be followed by way of Ballaugh and Sulby into Ramsey, from whence the ascent of the "hairpin" corner will be made for Snaefell and by the Bungalow for the finish at Ballaskilly.

Wednesday was to have been devoted to the "Graphic" and "Henry Edmunds" trophies, but, owing to the few entries received for these events, both have been abandoned. For each, two Napier and two Metallurgique cars were entered, and for the "Graphic" contest one Westinghouse car.

DOUGLAS, Tuesday.

The morning of Thursday last week was characteristic of the bad weather that has been general throughout the preparations for the race, and none of the drivers attempted very high speeds. Only about eighteen cars faced the elements, and they were content to tour the course, with the intention, no doubt, of making themselves better acquainted with the nature of the corners, but even in this process a number got stuck on the mountain road. The Vulcan car, however, had a good spin. The two Westinghouses were out, No. 20 being noticed to be "missing" badly. The second car of the same make, No. 12a, was out

Mr. P. D. Stirling at the wheel of his Hutton "Four-Inch" Car.

again, the necessary adjustments having been effected to the magneto and its timing. Rawlinson on the Darracq took matters very easily, and perhaps the fastest round of the morning was accomplished by Ward on a S.C.A.T., his time being 47 min. The topic of conversation at the practices on Friday morning was the arrival on the previous day of the three Metallurgiques, accompanied by Oscar Cupper and a large number of mechanics. No risks were apparently taken with regard to the safe arrival of the cars, and no expense was spared in their transport, as they were conveyed to the Island from Belgium by special boats and trains. On arrival of the steamer in Douglas Bay it was found that the tide would not permit of the steamer entering the harbour, so they were ultimately landed at Ramsey. A large number of cars were out, but practising had hardly begun when a serious accident happened to the Metallurgique No. 7, driven by Cupper. He was turning Willaston corner when he ran into the hedge with such force that the car overturned with Cupper and his mechanic (Brandt) underneath. Several spectators on the scene rushed to the assistance of the unfortunate men, and it was only after much difficulty and after some length of time that the car could be righted and the men extricated. While the rescue work was proceeding the oncoming cars were stopped, George and Lee Guinness having been following close on the heels of Cupper, who was starting on his second circuit. Guinness went back to Hilberry and brought Dr. Finnay to the scene of the disaster. Cupper, with the exception of suffering from a slight shock and receiving a cut eye, was not hurt, but Brandt, who was on the side of the car which struck the hedge, had not escaped so luckily, and was removed to Nobles (Isle of Man) Hospital. The car was not badly damaged, the most serious injury being to the steering gear. Practising after this was practically stopped for the day, it being thought that Brandt was more seriously hurt than ultimately proved to be the case. Cupper, seen during the day, stated that he had accomplished his first circuit (38 miles) in 37 minutes; his speed up the mountains was 63 miles an hour, and his pace down Hilberry reached 100 miles an hour, while his car developed 97½-h.p. He wired to Belgium for another mechanic, and expected to be out in the course of a day or two. On Friday afternoon another accident occurred, the victim being Slaughter, on a Triumph motor-bicycle, while practising for the Motor-cycle

Race. He collided with the hedge on a corner and sustained a badly-cut head.

On Monday morning many spectators took advantage of the fine conditions, and all seemed pleased to see Cupper out again on his repaired car. The injury to his eye was, however, still prominent. He took matters very easily and stopped and keenly surveyed the corner at which he came to grief with such disastrous results. Most of the competitors took matters more or less easily, no doubt recognising that, owing to the proximity of the day of the race, a smash would at this period be fatal, as time would not permit of any necessary repairs being effected. The fastest time was done by the Beeston-Humber—50 min. The Piccard car was round this morning and met with favourable comment.

Much curiosity has been evinced to-day in the absence of the special "Hutton" car driven by Mr. Hutton from practice since Thursday. This evening I learned that it is evident that something serious is the matter with some part of the engine. My informant happened to pay a surprise visit to the Hutton garage at Glen Helen this afternoon, and was surprised to find a big staff of mechanics busily employed on parts of the engine.

[BY TELEGRAPH.]

DOUGLAS, Wednesday.

Tuesday morning was the last occasion allowed for practice for the Four-inch Race; the weather was fine, but only very few cars were out, on account of their having to be presented for inspection at ten o'clock at the enclosure at Hilberry. Most of the competitors who indulged in practice only toured round the course, and no high speeds were attained, as will be understood from the fact that several carried ladies as passengers, Porter on his Calthorpe, however, did several fast rounds, and the chances of this competitor are viewed with considerable favour. Thirty-six cars were presented for the inspection yesterday morning, the only absentees being the two Berliets. The scene was a busy one; no fixed time had been stipulated prior to which cars must put in appearance, but weighing-in began at ten o'clock, and competitors made an attempt to get there before that hour.

Three Darracqs and two Thornycrofts were actually the last to appear. A weighing machine had been erected, and the officials proceeded rapidly with the checking of the cars, which have to be over 1,600 lb. in weight. The racing cars are not this year being detained in the custody of the Club, and were at liberty as soon as they had passed the scales. Most of the

Mr. G. W. Brown at the wheel of his Coventry Humber.

drivers have now submitted themselves and passed the doctor's examination. Prince Francis of Teck, chairman of the R.A.C., arrived last night, and is staying with the Lieutenant-Governor of the island. The Hon. Arthur Stanley is also expected. To-day a motor meet takes place, the Government House officials making a tour of inspection of the course. Admirable arrangements have been made for the race, which is expected to be keenly contested.

THE TOURIST TROPHY MOTOR-CYCLE RACE.

ON Tuesday the Tourist Trophy Motor-cycle Race was run, over the same course as last year, starting from St. John's to Ballacraine, Glen Helen, Kirkmichael, Devil's Elbow, St. Germain's, Peel and back to St. John's. This was covered ten times, making a total distance of 158 miles 220 yards. The allowance of petrol was 1 gallon 4 pints 13 oz. for the single-cylinder, and 1 gallon 7 pints 16½ oz. for the multi-cylinder machines, calculated on a basis of one gallon per 100 miles for the former and one gallon per 80 miles for the latter.

The following is a complete list of entrants of single-cylinder machines:—C. R. Collier, 4-h.p. Matchless-J.A.P.; H. A. Collier, 4-h.p. Matchless-J.A.P.; Triumph Cycle Co., Ltd., 3½-h.p. Triumph (three): R. W. Ellis (P), 3½-h.p. Rex; C. Gordon Gibson (P), 3½-h.p. Triumph; C. B. Franklin (P), 3½-h.p. Chater-Lea-J.A.P.; Brown Bros., 3½-h.p. Brown; W. G. McMinnies (P), 3½-h.p. Triumph; H. Lister Cooper (P), 3½-h.p. Triumph; H. Brown (P), 3½-h.p. Triumph; Rex Motor Manufacturing Co., 3½-h.p. Rex (two); N.S.U. Motor Co., 3½-h.p. N.S.U.

The multi-cylinder entrants were:—H. Rem Fowler (P), 5-h.p. Norton; H. Collier, 7-h.p. Matchless-J.A.P.; Bat Motor Manufacturing Company, 6-7-h.p. Bat-J.A.P.; W. H. Wells, 5-h.p. Vindec Special; W. H. Bashall (P), 6-7-h.p. Bat-J.A.P.; W. E. Drury (P), 5-h.p. Jap; S. C. Perryman (P), 5-h.p. Norton; W. H. Wells, 5-h.p. Vindec Special; W. Gurr, 5-h.p. F.N. (four); A. J. Moorhouse (P), 5-h.p. Rex; E. G. Young, 3½-h.p. Young-Bentinck; E. Varney (P), 7-h.p. Crownfield; H. Reed, 5-h.p. Dot-Peugeot; Rex Motor Manufacturing Company, 5-h.p. Rex (three); R. O. Clark, 5-h.p. F.N. (four); N.S.U. Motor Company, 4-h.p. N.S.U.; Pellant and Bilbie, 3½-h.p. Young-Bentinck; J. O. M. Dixon (P), 5-h.p. Vindec Special; J. Lang (P), 6-h.p. N.S.U.; J. Baxter (P), 5-h.p. Rex. (P) Private owner.

All of the fifteen entrants in the single-cylinder class started, while of the twenty-two competitors in the multi-cylinder class there was only one absentee, E. Varney. The riders were dispatched in pairs of one single and one multi-cylinder machine, there being an interval of 30 sec. between each couple. At the half distance, when the competitors were allowed five minutes to take in a re-fill of petrol, the leading positions were:—Single cylinders.—C. R. Collier, 2 h. 8 min. 49 sec., first; J. Marshall, 2 h. 11 min. 7 sec., second; Capt. Sir R. K. Arbuthnot, 2 h. 14 min. 57 sec., third. Multi-cylinders.—W. H. Bashall, 2 h. 8 min. 54 sec., first; W. H. Wells, 2 h. 13 min. 49 sec., second; R. M. White, 2 h. 16 min. 25 sec., third. A keen struggle was maintained in the single-cylinder class between Collier and Marshall, but eventually the latter won by nearly three minutes, thus reversing the positions in the 1907 contest. The result was:—J. Marshall, 3½-h.p. Triumph, 4 hr. 4 min. 50 1-5 sec., first and winner of Tourist Trophy; C. R. Collier, 3½-h.p. Matchless, 4 hr. 7 min. 6 4-5 sec., second; and Capt. Sir A. R. Arbuthnot, Bart., 3½-h.p. Triumph, 4 hr. 17 min. 57 sec., third. Seven other competitors finished the contest, while five retired.

In the multi-cylinder class the honours of the day fell to H. Reed, 5-h.p. Dot, in 4 h. 15 m. 58 2-5 sec., W. H. Bashall, 6-7-h.p. Bat, being second in 4 h. 18 min. 15 sec., and R. O. Clark, 5-h.p. F.N., third in 4 h. 21 min. 2 4-5 sec. Of the other competitors seven finished and eleven retired. There were two or three falls during the race, which did not occasion any injury to the drivers, but Gurr, who was on a 5-h.p. F.N. machine, had a side-slip, and his face, coming into contact with the ground, was badly disfigured. It was by no means serious, however, and, although he retired from the contest, he was not compelled even to seek medical aid.

So far fifteen entries have been received for the race for the American Automobile Club's Grand Prix, which is to be held in Savannah on November 26th next; they include six European—three each Fiat and Benz—and nine American vehicles.

THE SOCIAL WHIRL.

PRINCE FRANCIS OF TECK, the chairman of the Royal A.C., has accepted an invitation to attend the annual dinner of the Northamptonshire Automobile Club on October 16th. Among those who have signified their intention of being present on the occasion are Lord Annaly, Lord Lilford, Sir Thomas Fermor-Hesketh, Sir Charles V. Knightley and Mr. S. G. Stopford Sackville, chairman of the Northamptonshire County Council. Mr. Sackville sat in the last Parliament, and is keenly interested in local government.

THE motor-car played a conspicuous part in the recent appearance of Mr. Harry Lauder before the King at Rufford Abbey, Newark, where His Majesty was the guest of Lord and Lady Savile. Mr. Lauder first visited Captain Laycock at Wiseton Hall, near Retford. Captain Laycock is a member of the R.A.C., and a few years ago was well known in connection with all club events. He and the Scottish comedian motored to Rufford Hall, twenty-two miles away, and later they returned to Wiseton.

MR. HENRY C. PEARSON, Chairman of the Contest Committee of the Massachusetts Automobile Club, is at present touring with his car in this country. He writes that he is delighted with the London traffic regulations, with the skill of the drivers of motor-cars, the good nature of the operators of horse-drawn vehicles, and the sound common-sense of the police. "No city in the world has anything equalling it. Your country roads are very nearly perfect."

THE chauffeur to the Duchess of Newcastle escaped the police on Saturday, when taken before the magistrates of the Eastern Ainsty Petty Sessions at York. The facts of the case were that the Duchess of Newcastle, who was at Harrogate, had lent her motor-car to take a party to York races. The chauffeur (defendant) knew the road perfectly well, was aware there was a police-trap at that place, and drove at an ordinary normal pace. The defendant was cautious in passing traffic on the road. Defendant, said his solicitor, was formerly in the service of Lord Linlithgow, had been driving ever since 1896, and had never been cautioned. The case was a serious one for him, as the Duchess of Newcastle would not employ a chauffeur who drove at a dangerous pace along the public roads. The magistrate dismissed the case.

MOTORISTS in the quiet cathedral city of Hereford, the Bishop of which is a vice-president of the M.U., know both the Mitre and Green Dragon hotels. Each has played its part in connection with local motoring, and now the latter will come even more to the front, Mr. James Fryer, the well-known motor agent, of Kington, having taken over the Green Dragon garage, at the rear of the hotel. Accommodation will be provided for a hundred automobiles.

SIR JOHN BETHELL, who represents the largest constituency in the country, viz., the Romford division of Essex, is a motorist—so too are the representatives of a couple of constituencies nearer the City of London. Mr. Stopford Brooke, M.P. for Bow and Bromley, has a car, and the other day motored from his residence at Cranleigh, in Surrey, to Chingford, in Epping Forest. Mr. Leverton Harris, M.P. for Stepney, has just toured Ireland in his automobile, and has now taken his car with him to Scotland. Later it is his intention to go to the Continent and have a motor tour in the Loire Valley.

VISITORS to Llandudno are probably better served in the way of seeing the surrounding country by motor-car than those who go to any other resort. Mr. Thomas Foster, the manager of the Llandudno Motor and Garage Company, Ltd., has arranged various trips to places of interest and delight in the district. Often motorists, fearful of their tyres over the mountain passes, take trips by these public conveyances, and cause much wonderment among the "ordinary trippers" by the variety and extent of their technical knowledge.

LOLLIUS.

GOSSIP FROM PARIS.

SOME people have predicted the coming Paris Salon will be less successful than its predecessors. I do not pretend to prove the contrary, but if it is not a success it will not be because it will be wanting in novelties; for instance, there will be the aeroplanes, which will surely make a brave show, and constitute one of the great attractions. Then again, most if not all of the automobile manufacturers have learned by experience and will exhibit cars really suitable for every-day work, and not simply vehicles which only the very rich can purchase and use. The Panhard firm has in this respect turned over quite a new leaf. Instead of devoting all its attention to the production of high power touring cars, it will exhibit as one of its most important models for next year a chassis destined to compete with the Renault taxi-cabs and suitable for a comparatively light body. Though I have not as yet been able to ascertain the exact horse-power of the motor, I am assured it will be about the same as that of the Renault. The Panhard Company is also making a six-cylinder of about 20-h.p. But even that is not all. The company has acquired the

find autophobes. There are plenty of them still left in France, and even in the immediate vicinity of the Ville Lumiere some communes, believing they have a free hand against automobilists, and that they can levy blackmail on them with impunity, are trying to make the persecution of the motorist a paying enterprise. For instance, the Mayor of Rueil, almost at the gates of Paris, not long ago gave instructions which resulted in the fining of very nearly every motorist who was unfortunate enough to approach the locality. He wanted to make them in this way pay for the tarring of the roads; but after a time, finding the money did not come in so quickly as he had expected, he conceived the idea of "catching" innocent cyclists and making them also contribute to the fund. With this object he had one of the most frequented roads broken up and covered with a thick layer of stones which were left for forty-eight hours before being rolled in. Of course the unsuspecting cyclists took to the footpath. But the Mayor's men were awaiting them at the further end, and a *proces verbal* was drawn up against each of the offenders. It is affirmed the fines which thus fell into the municipal treasury amounted to quite a good round sum. In

The Special Motor Van which has lately been put into service in the Paris district for the Transport of Race Horses.

patent rights of a new change-speed gear invented by Henriad. The mechanism is practically lodged in the flywheel of the motor; consequently this new gear occupies but very little room. It is said to be most efficient and cheap to manufacture. Although it is premature to give a detailed description of it at the present moment, I may say the gear is of the epicyclic type, but quite different from what has been designed in that line up to the present moment. The engineers of the Panhard firm have been putting the new gear to all sorts of tests for several months, and it is possible, if not probable, that it will be employed in the 1909 cars. As for Messrs. Renault Frères, their new models for 1909 will include a small car complete with body having seats for two persons, and fitted with a two-cylinder motor of about 6-h.p. The price will be approximately 4,500 francs (£180).

"I SHOULD imagine that in the future the inhabitants of every civilised country, including the Japanese and Chinese, will class the persecution of automobilism with the former persecution of science." It was a gentleman who, making a tour in Switzerland, had suffered from the endless vexations imposed on motorists in that country, that expressed his sentiments to me in that elegant but forcible phrase. But unfortunately it is, as everybody knows, not necessary to go to the land of William Tell to

any case the Mayor appears to be satisfied with the result of his stratagem.

ANOTHER vexatious and incomprehensible measure has been taken at St. Malo. When a motor-car is shipped on a steamer the petrol tank is always emptied to avoid the possibility of an accident, consequently all the touring automobiles arriving by boat at St. Malo require essence immediately they are put on shore. Until quite recently there was a petrol depot on the quay, but for some unknown reason the St. Malo authorities have suppressed it, and, what is more, they have prohibited the vendors of petrol from bringing even a litre or two on the quay to enable the cars to reach the nearest garage in the town.

MARNEY.

AN American motorist writing to the "Automobile" of New York states that he has found old newspapers a useful aid to touring. "I have found it a good plan," he writes, "to carry several newspapers in the car when touring. If the rear wheels start to spin round in a muddy spot a couple of newspapers spread over the mud will often enable the rear wheels to climb out. Newspapers will also be found handy when any adjustments have to be made under the car."

HUNTING FOR HILLS ON A 15-H.P. TALBOT.

"WOULD you like to go on a hill-hunting expedition?" was the message that came over the telephone a few days ago from Mr. H. W. Cutler, of the Clement-Talbot, Ltd., and as the proposal was both novel and interesting, I readily acquiesced. The result was the arrival outside the offices of the M.C.J. of a smart-looking 15-h.p. Talbot, with Mr. Cutler on board, and Mr. F. W. Hedge, one of the company's most experienced drivers, at the wheel. A brief "council of war" was held, during which it transpired that not only had the car which was standing quietly near us successfully mounted most of the steepest hills in Kent, including one having a piece as acute as 1 in 4.3, but that it was the identical vehicle which had carried off the gold medal in its class in the Irish Reliability Trials (where it scored the maximum number of marks

"which is Hendon way," was quickly passed, as was also Edgware. Then came Brockley Hill, up which the car glided so easily that doubts arose in my mind as to whether Woodcock Hill would, after all, prove any obstacle to the Talbot. Arrived at Elstree, we turned sharp to the right and within a few minutes the vehicle was ploughing its way up the hill at a rate which, four years ago, would have been deemed impossible. As a matter of fact, the major portion was taken on the top speed, only the steep part towards the summit necessitating a drop to "third."

Hedge made so light of the hill that I determined to find one that he at least would deem worthy of the name. After taking a by-road which landed us in a farmyard, and retracing our steps, we got to South Mimms and eventually to Ridge Hill, where we found a narrow road known as the Old Lane, the gradient of which appeared to present some possibilities in the way of putting the vehicle to the test. I was, however, doomed

Hunting for Hills on a 15-h.p. Talbot.

The centre picture depicts the car on Woodcock Hill, Elstree, while the two lower ones show it on the steep gradient near the railway station at Radlett.

on all the three hills as well as for reliability), and also proved the victor in Class B in the Pateley Bridge hill climb of the Yorkshire A.C. on the 12th inst.

With such a record as this, any idea I had entertained of finding a hill in the neighbourhood of London that the car could not negotiate was dashed to the ground, and it was with a sort of *nil desperandum* feeling that I suggested we should make for the district bounded on the north by St. Albans, on the west by Watford, and to the east by Barnet. Our driver seemed to scoff at the idea that there were any gradients worthy of the name in that centre; but I had not forgotten that the last Glasgow to London run promoted by the Scottish Club included in its itinerary Woodcock Hill, a gradient on the road between Elstree and Barnet, which, starting with a stretch of 1 in 18, and increasing in steepness to 1 in 7 and 1 in 8, proved the undoing of several competitors who up to that part of the 1904 Scottish Trial had scored full marks. Proceeding along the busy Edgware Road, I had ample opportunity of noting how easily the vehicle can be handled in traffic, and how quickly both the engine and car respond to the slightest movement of the throttle lever. Once clear of the traffic, Hedge also gave me a short demonstration of the speed of the machine on the level, as a sort of proof that it is not specially geared for hill-climbing and hill-climbing work only. The Welsh Harp,

to disappointment again, for the car made almost as light of it as Woodcock, going up on "third," and that from a standing start. Making inquiries of some local people, we ascertained that there was a very stiff hill near Radlett, whither we rapidly journeyed, passing on the way through the quaint village of Shenley, with its old round-house or village lock-up near the horse pond. "Here we are," cried Hedge, when he caught sight of a C.T.C. danger board, and we wended our way down a very steep and winding road into Radlett. Arrived at the bottom, the car was turned round, and from a standing start was set to the task of mounting what even our driver was bound to admit was worthy of his metal. However, the Talbot forged its way up without a falter. Starting on the first speed, the second gear was quickly slipped in, this being maintained to the top, the speed at which the car made the climb greatly astonishing the constable seen in one of the photos reproduced herewith.

The run back to town, while uneventful, further emphasised the fact that the Talbot 15-h.p. four-cylinder car should meet the requirements of a very large section of the motoring public. Silent and easy running, it is not only extremely speedy on the level, but, as is shown above, its hill-climbing capabilities are considerable; indeed, in view of the size of the engine—the bore is only 90 mm. and the stroke 117 mm.—they are extremely noteworthy.

ARCANUM.

A CANADIAN MOTORIST'S TOUR IN ENGLAND.

IN a recent issue of our Canadian contemporary, "Motoring," Mr. Lloyd Harris gives an account of a tour he recently made from London to Land's End, from which we take the following:—

While in England this summer I found that I would have a week to spare, and decided that I would rather spend it motoring than in any other manner. I made inquiries in London and found that it is quite easy to hire good cars on reasonable terms. There are a number of motor-car companies who have cars for this purpose, and who let them out for a day at prices ranging from five guineas, by the week for £30 upwards, and by the month at about £100, including the services of a chauffeur. I came across a man who had recently purchased a Panhard touring car with seating capacity for seven people who is at present devoting his time to hiring his vehicle and driving it himself. I made arrangements with him for a week, to take my party from London to Land's End and back, across the South of England. My arrangement with him was for an inclusive charge per day, he paying all his own expenses and agreeing to look after the car and to be responsible for any damages which might occur. Before the trip was over I decided that this arrangement was a most excellent one from my own standpoint.

I left London on the afternoon of Friday, June 5th, with one of my party. The traffic in the Metropolis certainly makes motoring in the City very difficult and not a very pleasant pastime, but when once in the country the beauty of motoring gradually begins to impress itself upon you, and after a few days of it you become imbued with the idea that the sport, under Canadian conditions, is not all that it should be, and it will take a very long time for us to have the same splendid roads that exist in England. We passed through Kingston, and on reaching Guildford stopped for afternoon tea for half an hour, and then continued our journey, travelling by the Hog's Back, which has one of the most beautiful views I have ever seen. The road itself runs along a high ridge, very much above the level of the country on either side of the car for some distance. We passed through Farnham, Petersfield, Havant, and arrived at our destination, Southsea, at 7 p.m., the distance covered being seventy-six miles.

Starting on the afternoon of the following day with our whole party, numbering five, including the chauffeur, we took the road following the sea coast through Southampton West, and from there, skirting inland, passed through the New Forest to Ringwood, and then on to the old agricultural town of Dorchester, a distance of seventy-five miles. The next morning, June 7th, we set out at ten o'clock and followed the road running along the coast to Bridport and Charmouth. Just before reaching Charmouth we had a front tyre burst and unfortunately did not have a spare one with us, but were able to make repairs which carried us to Exeter, through Axminster and Honiton. After lunch we continued our journey, and passing through Chudleigh and Ivy Bridge, went on to Plymouth. Everyone has heard about the beauties of Devon, so that I do not propose to enlarge upon them, but I certainly think that this is one of the finest and most interesting counties in England to see from an automobile. The hills are very steep and it is practically all up and down hill, so that it requires a good car with high power and with the brakes in excellent condition.

On Monday, June 8th, we left Plymouth at 10.30 and ran down to the ferry, where we ferried across to Saltash. When

leaving, it was raining slightly, but by the time we landed in Saltash the rain had ceased, and this was the only time on our whole trip that we had any rain, so that we were exceedingly fortunate in this respect. We were now in Cornwall, passing through Liskeard, thence to Lostwithiel, and from this point we branched off to a small watering place named Fowey, where we had arranged to lunch. This I found one of the most beautiful spots I had ever visited, and, it being a public holiday, all the people were out in their gala attire, and we interested ourselves for a couple of hours after lunch watching and listening to the Cornish people, who were enjoying themselves in their own way. On arriving at Truro in the afternoon we looked into the cathedral which has been in process of building for several years past, and which is now about completed, but has not the same interest as some of the older cathedrals in England. Leaving Truro, we took the road running to Penryn, thence to Helston, and some distance further on St. Michael's Mount came into view. From the side that we approached it, it was a most beautiful and impressive sight to see the old castle standing on a rock rising out of the ocean. As we had all visited the castle before we did not stop but ran on into Penzance, having covered about eighty-five miles for the day. The following day was spent in Penzance, renewing old acquaintances and calling at Newlyn, the famous fishing village which so many English artists make their permanent home.

We left Penzance early on June 10th, taking a road further north than the one we had arrived by, passing through Camborne and Redruth, then across the moors, where the road is straight and wide. After lunching at Launceston we quickly entered Devonshire, and the whole afternoon was spent crossing the moors of Devon, the road taking us through Okehampton to Exeter, where we arrived before five o'clock, having covered about 112 miles for the day. We visited the famous cathedral and had a good look over the town, some parts of which are very old and quaint.

The next day we followed the same road as far as Honiton as we had journeyed on our way west. At this point we branched off to Chard, passing through Yeovil, Sherburne, and Shaftes-

bury to Salisbury. Here we stopped for a view of the cathedral, which we found very interesting, although not so much so as that at Exeter. We then started for Winchester, and on our way there had the first accident which occurred on the trip, and which fortunately was not as bad as it might have been. A horse and trap coming down a side road, travelling at a rapid rate, ran into our car; the result was that the occupants of the trap, a lady and her coachman, were thrown out and injured. However, we were able to render all necessary assistance and took the lady to her home. Although we were unable to reach Winchester until 7.30 at night we were able to see something of the town, which is one of the most interesting in the whole of England. The tour came to an end on Friday, June 12th, and the following day I sailed for New York.

I was greatly delighted with the experience, and am ready to take another tour of the same kind. The country is perfect for motoring, and the only danger is that the roads generally are rather narrow and very winding, so that it is impossible to see any great distance ahead, and for this reason it is very unsafe to travel at an excessive speed.

From my experience I do not think I would go to the trouble of taking my own car over for use for a month or two, as I believe that satisfactory cars can be hired in England, and the cost would not be any greater than that of taking a car from Canada, when everything is taken into consideration.

The Fore Street, Okehampton.

HOW TO FOLD AN INNER TUBE.

NUMBERS of automobilists, especially novices, are unaware of the proper method of folding spare inner tubes or how to carry them on the cars, writes Baudry de Saunier in our French contemporary "Omnia." To fold a tube in the most satisfactory manner the detachable parts of the valve should first of all be removed in order that the air may easily escape during the latter operation. The work should be done on a table, or other convenient flat surface, providing it is free from oil or any liquid, and especially from grit. If no table is available, it can be done by holding the tube against one's chest, but the operation is then more difficult, and the operator's clothes are not improved. Whatever may be the support, the tube should be rolled up as tightly as possible, beginning at the end farthest removed from the valve. A large part of the air is thus partly driven out through the open valve tube, but, owing to the bend at *bb'*, some will accumulate at *aa'*. To get rid of this, while holding tightly the rolled part *R* with the left hand, draw to the rear from time to time the opposite end *V*. Continue to do this until the tube is completely rolled, as shown at Fig. 2.

Still holding the tube as tightly as possible, insert the valve parts and put on the cap, screwing up as tightly as possible with the fingers, but not on any account using the pliers. The inner tube is now completely flattened, and it should always be brought into this condition (if it is not so already) every time it is desired to put a new tube in a tyre. When perfectly flattened

the insertion of a tube is greatly simplified and at the same time it is largely preserved from nipping or injury from a lever or other tyre tool. The results are well worth the little labour.

The next stage in the folding of the spare tube in order to carry it in as small a space as possible is to open it out again, as at Fig. 3, the valve being in the centre and uppermost. Careful motorists will find it advisable to cover the valve with a rubber finger similar to those sold at drug stores. If these are not available, one can be made out of a piece of cloth. This covering protects the tyre against the ill effects which may arise when the valve is allowed to rub against the rubber. Now fold each end of the tube inwards towards the valve as indicated in Figs. 4 and 5, forming the flat package Fig. 6, which should be secured by a couple of tapes, or, better still, by a couple of rubber bands made out of an old tube.

If the tube is punctured or without a valve, it is useless to attempt to fold it, for, although the air may be driven out, it will enter again by the hole or through the valve as soon as pressure is removed. In cases of this kind, the tube, as soon as it has been rolled in the way shown at Fig. 2, should be held securely with tape in order that it may not lose its shape, and left in that condition. The particular advantage of this is that it enables one at a glance to distinguish between perfect and imperfect tubes, the perfect ones being folded and the punctured ones rolled.

Each tube should be placed in one of the waterproof bags specially made for the purpose. This is only a detail, but it is a very important one. The bag protects the tube better than any other kind of packing, preserving it from contact with tools or other rough objects, and keeping it out of the way of oil and water. If a handful of French chalk is thrown into the bag, the tube automatically prepares itself for being mounted within the tyre. If no bag is available, the tube should be wrapped in a piece of clean cloth and secured with a string. When on the road the spare tubes, packed in the way indicated, should be carried in a separate box and not in the common compartment where oil cans and tools struggle for the most comfortable position.

SOME USEFUL NOTES.

VALVE springs, more particularly the exhaust, will not remain the same for ever. When everything else has been tried, and still the engine lacks its usual power, put a new set of valve springs all round and the trouble will then probably vanish.

WHEN side brakes are actuated by a wire rope, keep a lookout now and again at the places where the wire rounds a bend, or anywhere where it is liable to chafe. These wires, after a strand or two has gone, soon go altogether, and to suddenly find the side brake useless is most disconcerting, more particularly as a roadside repair is not particularly easy.

Do not neglect a "blow" in an engine. It may only be a faulty joint, such as a leaky valve cap, &c., but it may be an internal blow, which means badly-fitting piston rings, or possibly the rings have so moved that the slots are all in line. In any case an internal blow is very bad, as it causes a carbon deposit to eventually accumulate in the base chamber, and then the big end and main bearings are liable to be scored.

THE fouling up of cylinder heads, tops of pistons, valves, and valve ports, is frequently the cause of loss of power. This is a bad feature of an engine, and is due to either (a) bad carburation, (b) over-lubrication (c) or both these causes. Sometimes an inferior brand of lubricating oil will cause a rapid deposit to form on these parts. It is always well, if there is any doubt in the matter, to examine them every thousand miles.

A COVER that is nearly worn out frequently gives way at the head and is usually scrapped. This is not at all necessary, as a repair can be made, and it is one of the many cases where the careful man can save money. First patch the burst inside with a piece of very short canvas, bringing the latter just up to the inside edge of the bead; then stick another piece of canvas over this one, but bring it right over the bead, and about one inch and a half higher than the bed of the same on the outside. The whole lot should then be stitched with a wax-end, so that the canvas will not stretch. A repair of this description is good, if used on a front wheel, for fully three hundred miles.

It may not be clear to all motorists why the gaseous charge in the cylinders of a petrol motor is compressed before ignition, especially since the compression absorbs power. By compressing the charge before ignition a proportionally higher explosion pressure is obtained, and also a much higher mean pressure during the explosion stroke. Much greater power is therefore obtained from the same engine, and the thermal efficiency—i.e., the relative amount of power obtained from a certain amount of fuel—is also increased. Generally speaking, the higher the compression the greater the power of an engine of given dimensions and the greater the fuel economy; but there is, of course, a limit beyond which it is not advisable to go, this being fixed by the facts that when the compression is too high the charge is liable to ignite spontaneously at a too early period—a phenomenon known as pre-ignition—that the motor is hard to start (for the first explosion the charge must be compressed by hand), and that if the piston and valves are not a perfect fit a considerable part of the charge is likely to leak out.

It is said that Brighton is losing £3,000 every week end owing to the fear motorists have of motor traps between Redhill and Crawley.

A GOOD garage at Hereford is that of Messrs. Bowen and Co., whose establishment in the Commercial Road is well equipped for assisting motorists passing through the city.

THE decision of the directors of the Humber Company to concentrate the whole of their works at Coventry has occasioned very serious concern at Beeston, which owes so much of its development to the Humber Company.

MR. C. F. KNIGHT, the designer of the engine which has been adopted by the Daimler Company, will read a paper on "The Valveless Engine" at the Royal Automobile Club on the 15th prox., while on October 29th Mr. Charles Wicksteed will give one on "Change-speed Gears."

THE "Simplex" Speedometer, which was submitted to the Royal A.C. for official test on their calibrating machine, by Mr. A. T. Hawkes, on the 15th September, was found to be, at twenty miles an hour, absolutely correct, there not being the slightest fraction of error to be recorded.

WE learn from the Star Cycle Company, Ltd., Wolverhampton, that they have decided to call the 10-h.p. two-seated vehicle (built on racing car lines) illustrated in our issue of the 29th ult., the "Little Briton." A four-page leaflet giving full particulars of the car has just been issued by the makers.

A COMPANY in India is in the market for the supply of nine motor vehicle chassis, to carry loads of about 4 tons, and a dozen trailers of 2½ tons capacity. Full particulars can be obtained from the Manufacturers' Centre, Ltd., Commercial Buildings, Steelhouse Lane, Birmingham, to whom tenders for the supply of the vehicles are to be sent.

THE Kirkham police are said to be very busy working "traps" between Preston and Blackpool, and especially on the length between Lea Gate and Kirkham in the direction of Blackpool. Quarter-mile stretches are being timed at various points. The other Saturday about eight motorists were "held-up" between Lea Gate and Lane Ends, leading up to Freckleton Marsh.

It is announced that the differences between the Automobile Club of America and the American Automobile Association have been settled, the two bodies having arranged to work harmoniously together in future and to co-operate in organising the Vanderbilt Cup and the Savannah Grand Prize races. The first-named event will, it is reported, be confined to American-built cars.

THE County Chemical Company, Ltd., Excelsior Works, Birmingham, send us particulars of a new lubricant they have lately brought out for use in the gear-boxes and differential cases of motor-cars. The use of "Vasoleum," as the preparation is called, secures that a film of oil will adhere to each of the rubbing surfaces, and thus, by keeping them apart, preventing the friction of solids taking place and setting up fluid friction only. The lubricant is of sufficient consistency to prevent leakage either through the gear-box or axle sleeve, and is claimed to ensure quiet running and prevent wear and tear.

As stated in our last issue, Messrs. Dennis Bros., Ltd., Guildford, gave a demonstration of their new petrol motor fire engine at Weybridge, on the 16th inst. The machine was driven to the riverside town from London, and on arrival was coupled up to the mains in company with the local steam fire engine, in order that some idea of their respective powers could be obtained. Afterwards both machines were set to work to pump water from the Thames, and in this test the new appliance proved to be well ahead of the horse-drawn steam engine. Pumping 450 gallons of water to the minute, the automobile sent a spray into the air about 140 ft. high, which was considerably higher than that pumped by the steam engine. Even pumping a double spray the motor was able to exceed the heights attained by its rival, while it also succeeded in forcing three sprays of water through 300 ft. of hose 120 ft. into the air.

AN American steam car enthusiast—Mr. W. Hazelton, of Oneonta, N.Y.—has lately completed a steam car, the boiler of which uses coal as fuel.

THE Dumfries District Committee of the County Council have been considering applications by a number of schools in the district for the erection of caution boards.

AN addition to the Clydebank Fire Brigade has been made in the form of a motor fire engine of the "Fire King" type.

NEARLY all the paper manufacturers in Indianapolis, U.S.A., now employ motor-lorries for the delivery of paper to their customers.

THE Lord Provost of Aberdeen has given notice to suggest a report to the magistrates as to the propriety of regulations being made restricting the speed of motor-cars within the city boundaries to ten miles an hour.

CAPTAIN WINDHAM, of Clapham Junction, S.W., is taking steps to form an aeroplane club, the object of which will be to bring together all interested in the development of aeroplanes or "heavier-than-air" flying machines.

WE give an illustration herewith of the tool kit which is now being supplied gratis with the Lorraine-Dietrich cars. It will be noticed that this is remarkably complete, and includes, in addition to a large outfit of tools, a good assortment of spare

parts, as well as a jack, tyre pump, repair outfit, and a water bucket. All the tools are fitted in special places and contained in a handsome polished oak chest, which adds considerably to the appearance of a car when mounted on the footboard.

A STELLA 16-20-h.p. car belonging to Mr. F. J. Norbury has recently completed a tour of over 5,000 miles on some of the worst roads in India, Malay Peninsula, Straits Settlements, China and Java, including the Poeutjak Pass in Java. The latter is a six mile ascent, the average gradient of which is one in five, and the Stella car carried three passengers and luggage.

SIGNOR SCARFOGLIO, the Italian competitor in the New York-Paris race, arrived in London on Tuesday afternoon on his Züst car, which, since February last, has travelled across three continents, the journey extending altogether to about 28,000 miles. Scarfoglio reached Paris last week end and motored straight on to Calais, crossing by special boat. On Tuesday morning he ran up from Dover to the metropolis, accompanied by Mr. A. Pereno, of the Züst Motor Company, and amidst the cheers of a huge crowd his car came safely to rest in the temporary depot of the company in Long Acre, W.C.

AT Epsom, situated on the main road to Leatherhead and Dorking, Mr. T. Hersey not only has garage accommodation for about twenty cars but is well equipped for carrying out repairs of all kinds.

DURING the seven months ending with July last 558 motor-cars valued at £234,124 and parts to the extent of £59,751 were imported into the United States, the total of £293,875 comparing with £458,844 in the corresponding period of 1907.

Two Local Government Board inquiries in connection with proposed limitations of speed are about to be held. The first will be held at the Newhaven Urban District Council offices on October 1st to consider a proposal by the East Sussex County Council for restricting to eight miles an hour the speed of any motor-car driven along a portion of the Brighton to Eastbourne main road within the urban district of Newhaven. The second will be held at the Church Schools, Shepperton, on October 3rd to consider a proposal by the Middlesex County Council to reduce the speed limit in a specified portion of the parish of Shepperton to ten miles an hour. The Wimbledon Borough Council have also applied to the Local Government Board for a regulation reducing the speed limit to ten miles an hour on certain roads within the borough.

The 24-28-h.p. Petrol Van recently supplied by Messrs. Marten and Jellisee, Ltd., of Thames Ditton, to Messrs. W. H. Smith and Sons. The van carries two tons and runs daily between London and Letchworth, where Messrs. Smith have large printing and book-binding works.

QUITE a new departure in electric headlights and lamps for motor-cars is being introduced by the Sylverlyte Electric Lamp Company, Ltd., of 11, Poland Street, Oxford Street, London, W., the great feature being that by the use of an electric lamp of only 8 candle power an illumination is obtained equal to that given by a powerful acetylene headlight. This great capacity is attained by the use of a special lens, the rear conically-shaped face of which is silvered in the same way as a mirror. The lamp is not set, as usual, between the lens and a reflector at the back of the lamp, but is inserted directly in the lens—that is to say, in a recess specially made to receive it. In this way the whole of the rays of light emanating from the electric lamp are utilised, with the result that a Sylverlyte lamp will, it is claimed, throw a light 160 yards ahead of the car and clearly illuminate the road for 70 yards; furthermore, one of its special advantages is said to lie in its capacity to penetrate the thickest fog. The lamps, which are being made in various sizes, are intended to be run off a 10-volt battery of accumulators, which will provide sufficient current to run two lamps for thirty hours continuously, or three lamps for twenty-four hours. Apart from the lighting capacity of the new lamp, its cleanliness and freedom from the care and attention needed by acetylene generators are points which will no doubt appeal to a large number of motorists.

ONE of the Darracq-Serpollet steam 'buses running on the Hammersmith-Piccadilly Circus service has been fitted with a speed indicator.

THE Coulsdon Parish Council have forwarded to the Surrey County Council a resolution in favour of the imposition of a special road tax on motor-vehicles.

AT Ashton-under-Lyne Town Council meeting it was decided to bring the matter of the speed of motor-cars through the borough to the notice of the Watch Committee.

A SECRET trial of the British military aeroplane is reported to have taken place on Saturday last, on a level stretch of grass-land near the aeronautic factory at Farnborough.

LA SOCIÉTÉ LORRAINE-DIETRICH ask us to mention that there is no truth in the report that Duray is leaving the firm in order to drive an Italian car in the forthcoming American Grand Prix race.

THE motor water-van purchased by the Surbiton District Council has now been in use for more than a year, and a comparison of the cost with the old horse-drawn water-vans is distinctly in favour of the steam motor. After meeting the annual payments for principal and interest, and allowing for depreciation, there is a saving shown of over £80.

DR. JAMES AITKEN, medical officer for the Lancaster Union, motored into Dalton Road, Lancaster, the other night, to attend a patient. While absent from the car a group of small boys commenced to play with it, one inadvertently starting the engine. The car ran away, collided with a lamp-post, which it broke at the socket, and ultimately dashed into a stone wall. The front part of the car was wrecked.

A LOCAL GOVERNMENT BOARD inquiry was held at Bangor on Saturday last into an application by the city council for power to restrict the speed of motor-cars through the main street of the city to five miles an hour, and to ten miles an hour through certain other streets. Opposition was offered by the Motor Union, the North Wales Automobile Club, and the Automobile Club. The Mayor stated that he had witnessed scores of hair-breadth escapes on the part of motor-cars in one part of the city, but he admitted that he had not given information to the police. On the other hand, several tradesmen gave evidence in opposition to the application.

THE Scottish A.C. has observed a trial over 1,008 miles of road of the R.R.H. patent motor-car wheel, and have come to the conclusion that the trial has demonstrated—first, that the wheel was reliable, and showed no important wear under the prolonged and somewhat severe test; and second, that the use of these wheels does not unduly, if at all, increase the petrol consumption of the vehicle to which they are fitted, nor does it unduly affect the speed of the vehicle on hills, or its capability to climb steep gradients. In this device the internal wheel is an ordinary pneumatic-tyred wheel of small size, upon which is mounted an external or slipper wheel consisting of a solid rubber tyre with the necessary channel or rim, on either side of which are bolted steel plates. The inside of the rim of the external wheel is lined with wood, which forms the path against which the inner pneumatic tyre presses. The side plates take up the thrust and keep the slipper wheel in position over the inner wheel. The drive is transmitted from the inner to the outer wheel by friction of the pneumatic tyre on the wood lining. Two of the patent wheels under trial were fitted to the driving wheels of a 16-20-h.p. Mass car, driven through a live axle by a four-cylinder engine, bore 98, stroke 130, having three forward speeds and one reverse. The wheels measured 36 in. in diameter, or 2½ in. more than the measurement of the wheels which are standard to the car. This alteration would have had the effect of increasing the speed of the car on top gear at normal revolutions from 38 miles to 41 miles per hour, but by an alteration of the gear in the back axle from the standard type the gear ratio was reduced from 18-60 to 15-60, and the speed consequently reduced to 34 miles per hour on the third or top gear. The weight of the car unladen, but including petrol, water, and spares, was 28 cwt. 2 qr. and the average laden weight of the car during the trial is stated to have been 35 cwt. 1 qr. 15 lb.

CONTINENTAL NOTES.

The Semmering Hill Climb.

The annual hill-climbing competition up the Semmering organised by the Austrian Automobile Club was held on Sunday last. The event, which was run over a ten kilometre stretch, during the course of which the road rises over 1,300 ft., attracted a very large number of entries, the competitors being divided into several classes. The best time of the day was made by Salzer, whose time on a Grand Prix Mercedes was 7 min. 23 3-5 sec., beating the record made last year by Poege, also on a Mercedes, by 5 3-5 sec.

Speed Trials at Evreux.

Some formidable speeds were attained on Sunday last during the course of the trials held at Evreux, France, under the auspices of "Les Sports." The morning was devoted to the flying kilometre events, when Alezy on a Clement-Bayard six-cylinder car covered the distance in 20 4-5 sec., equal to over 108 miles per hour. The next best performance was that of Bablot on a Brasier Grand Prix racer, his time being 22 sec. Other good times were made by Demeester on a Demeester Voiturette Grand Prix vehicle (41 2-5 sec.), Mademoiselle Hervieu (43 1-5 sec.) on a Werner touring car in the 86-90 mm. bore class, and Champoiseau (34 4-5 sec.) on an Imperia in the 101-110 mm. bore section. Bablot had his revenge over Alezy in the afternoon when the standing mile trials were run off, for the Brasier covered the distance in 52 3-5 sec., as against the Clement-Bayard's 58 sec. An interesting part of the day's programme was a flexibility trial for six-cylinder cars; this was won by a Vinot-Deguignand, which covered the flying kilometre in 35 1/2 sec. when driven at full speed, and in 4 min. 36 3-5 sec.—its slowest rate without allowing the road wheels to stop.

Aeronautical News.

Several notable flights on aeroplanes have been made in France during the past few days, among them being one of 39 min. 18 sec. by Wilbur Wright, on the 16th inst., and one of 30 1/2 min. by Delagrangé on the 17th inst. The event of the week, however, was Wilbur Wright's flight on Monday, which lasted for no less than 1 h. 31 min. 25 sec., during which time he covered over 40 miles—a record both as regards time and distance. A fatal accident occurred in connection with a flight of the Wright aeroplane at Fort Meyer, near Washington, U.S.A., on the 17th inst., when Mr. Orville Wright had taken Lieut. Selfridge with him as passenger. When about 70 ft. up in the air the blade of one of the propellers broke, and the machine overturned and fell to the ground. Mr. Wright was injured in the arm and hip, while Lieut. Selfridge, who was badly hurt about the head, succumbed to his injuries a few hours later. The German military airship "Parseval" met with disaster on the 16th inst. One of the fin-like balancing flaps attached to the rear of the envelope had been torn loose by the wind, and its jagged end tore a rent in the balloon, which collapsed and fell on the roof of a villa near Berlin. Fortunately none of the five occupants of the airship met with injury. The Aéro Club de France is reported to be about to offer a prize to the inventor of the aeroplane possessing the least volume.

British Motorists in France.

Recent British visitors to France include Mr. and Mrs. Enoch, London (20-h.p. Mors), Mr. S. A. Edenfield, Doncaster (Napier), Mr. and Mrs. P. Ronway, London (40-h.p. Daimler), Mr. and Mrs. Stafford (28-h.p. Mercedes), and Capt. and Mrs. Brett (30 h.p. Charron).

Motor Vehicles in the French Military Manoeuvres.

In response to the invitation of the French Ministry of War for the loan of at least 80 motor-wagons by manufacturers for use in the manoeuvres at present being held in the Blois, Tours, Chateauroux and Bourges district, only about fifty vehicles were offered and are now being used for various purposes.

Among them are three Renard trains, three Ariei lorries, a Latil, two Mathian-Cohendets, two Panhards, ten Emress, three Peugeotts, a Lorraine-Dietrich, a Delaunay and a Berliet.

A Motor Coster's Barrow.

The latest development of the automobile movement is a motor coster's barrow, a patent for which has just been taken out in France by M. Lionel Gervais, who provides an ordinary wheeled hand cart with a small air-cooled engine, which drives the vehicle through a belt and chains. It is doubtful whether the new arrangement will ever supersede the familiar donkey and cart, as, although the coster will not have to push his load, he will be compelled to walk between the shafts in order to guide the vehicle.

Automobilism in Norway.

Owing to the physical character of the country, it is probable that Norway will prove but a limited market for motor-cars. Nevertheless, they have come into use in several parts of the country, both for pleasure and commercial purposes. There are about ninety cars registered in the country, the greater portion of them being in Christiania, which is the only city in Norway where registration of cars is compulsory. The strict rules and regulations laid down by the authorities for driving cars on the Norwegian highways is one of the serious drawbacks to the development of the movement. Every district has its special

The novel N.A.G. Public Service Vehicle lately put on the road between Marklissa and Flinsberg, Germany.

rules in regard to such matters; thus a new permit has to be obtained for each one to be traversed. In some districts motor-car driving has been entirely prohibited; in other places only certain roads may be used, and then only on specified days. The explanation given is that the roads are too narrow for the safe passage of horse vehicles and motor-cars at the same time. New and more liberal rules, uniform for the whole country as far as practicable, are now under preparation by a committee specially appointed for the purpose, but it will take a year or more before any new enactment comes into force.

Miscellaneous Items.

A Lorraine-Dietrich 5-ton petrol lorry was recently driven to the summit of the Acropolis at Athens.—The municipal authorities of St. Petersburg are about to inaugurate fresh trials of motor fire engines. The two vehicles which have been used for some time past have not answered expectations, they being not powerful enough to attain a good speed when carrying a full complement of men.—To meet the demand for a medium-power car, the Brasier Company has just introduced a 12-h.p. live axle vehicle fitted with a two-cylinder (90 mm. bore by 120 mm. stroke) engine.

TYRE PROTECTORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some time ago I asked in your columns "Can somebody invent a system of attaching non-skid detachable leather covers to motor car wheels independently of the tyre rim?" I have used all kinds of tyres on seven motor-cars that I have owned. My last car, a 40-h.p. Fiat, had plain Michelins. I had a complete set of detachable non-skid covers fitted to protect the smooth tyres, and for eighteen months the tyres were not disturbed nor did I have a puncture. At the end of this time, as I was going for a long motor tour in Ireland, I took off the tyres and put on a set of rubber non-skids. These have been cut to pieces by the sharp stones encountered in Ireland while running 1,155 miles. The plain covers that I took off were only worn or frayed where the hooks fit under the rim. They were also sodden, because one objection to this form of attachment is the fact that water gets into the tyre when the car is being washed.

I feel convinced that if a satisfactory system of attaching detachable leather non-skid covers, such as Durandal, Grose, &c., could be devised, they would be universally used, because there is no reason why a plain rubber cover or tyre should not run for two years on a car if it is protected by a well-constructed and independent detachable cover. The art of making these detachable covers is now fully understood, but the system of attachment is wrong, and can't, in my opinion, be easily

The 5-ton Petrol Motor Lorry used by the Buffalo Bag Company, of Buffalo, U.S.A.

The vehicle, which was built by the American Motor Truck Company, of Lockport, N.Y., is fitted with a 35-40-h.p. four-cylinder engine, planetary transmission giving two speeds forward and reverse, and side chain drive to the rear wheels. The owners report that "the vehicle has been in use daily for over six months in all kinds of weather, having displaced two of our double horse-drawn vehicles."

improved. Small castings could be made to receive the hooks, and these castings could be screwed on to the wheels by any handy man. It is well known that non-skid tyres do not run as long as ordinary smooth rubber tyres; they are also much more expensive. I find that these non-skid detachable cover can be repaired by any good belt man, and I think there is a great future for them if they are constructed as I suggest, to be attached quite independently of the rubber cover and its rim.

I shall be glad if others of your readers will give their experiences on this subject.—Yours truly,

C. D. LENG.

A SUGGESTED NEW AEROPLANE CLUB.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Owing to the increasing and rapid development of the aeroplane, I have started a club to be devoted entirely to the aeroplane or "heavier than air machines," the object of the club being that those interested in aerostation shall be brought in touch with each other. The following are a few ideas which I suggest as a basis on which the club may be formed:—(1) That the subscription for the first 500 founder members shall be 10s. (2) That all printing matter from American, French, German and English papers relating to aerostation shall be obtained from press cutting agencies and suitably filed for reference. (3) That slides shall be made and kept, showing the various forms of aeroplanes in use, the parts used in the construction of same, and the various things connected with aeroplanes. (4) That no liability

will be involved to any member beyond the yearly subscription. (5) Until the club is self-supporting, I am prepared to do the secretaryship and to provide an office, telephone, lighting, &c., free of cost.

I have sent out some 8,000 circulars in connection with the matter, and have already had a large response from all parts and from all classes, expressing their wishes for the success of the club. I shall leave no stone unturned as far as I am concerned to make the club a success, and I hope that your readers will give me their encouragement by joining. The subscription for the present as "founder" members is 10s.; this, however, is shortly to be raised, as we anticipate a very large number joining. A general meeting is to be held, the date, time and place of which will be announced in your columns, for the purpose of electing a technical committee and drawing up the rules for the club.—Yours truly,

W. G. WINDHAM

(Captain.)

WHY LONG STROKE MOTORS?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been rather interested in the question of the R.A.C. formula for petrol engines, and have noticed the letter from Mr. S. F. Edge attacking the formula, and also against the use of a long stroke in a motor engine. Personally, I look upon any kind of restriction as good for the development of motor-cars, as it is always safe to assume that manufacturers, when confronted with a restriction which means they cannot obtain more power along that line, will at once set to work to obtain more power and better engines from the lines of thought that are left open to them. The R.A.C. formula, therefore, has been useful if only to bring out the possibilities of the long stroke.

Undoubtedly, the Club evolved its present formula on the ground that if the stroke were increased, the number of revolutions would be decreased, and so the power of the motor would be kept normal: that is to say, one maker would obtain 10-h.p. by having a small bore and a long stroke, and another would obtain 10-h.p. by having the big bore and a short stroke, and each would get the same piston speed and the same power, though the number of revolutions per minute would be quite different. But it was found, and here comes the rub, that if the engine, as regards shapes and sizes of valves, combustion chambers, inlet and exhaust pipes, and all the thousand and one small points that go to make a successful engine, were correctly designed, it was possible to get the engine to turn round practically as fast with the long stroke as it had previously been possible to get it to turn with the short stroke, with the great additional advantage that the piston would then pass through so many additional feet in a given time. This, in so many words, meant so many pounds lifted a tremendous additional number of feet.

For the R.A.C., therefore, to have succeeded in forcing the manufacturers to re-design their faulty valves, to re-design their ports and combustion chambers, &c., and nothing else, it would have still have had a beneficial effect on car design, because it must not be forgotten that, even though our manufacturers were now to revert to the obsolete short stroke, if they still retained their correct sizes and shapes of valves, ports, pipes, &c., that, for a given quantity of petrol, they would receive far and away more useful power at the road wheels than they did before they set out to improve their motors with the limited bore.

Mr. Edge sets out a series of objections to the long stroke which, to casual observation, might appear crushing.

Size of Engine.—Possibly, in an engine that is already too big either from its design or number of cylinders, a small addition to the stroke will be a serious item; but, with an engine correctly designed, and capable of giving an enormous power from a small size, the argument immediately falls to the ground. The alleged difficulty of the crank case having to be bigger to pass the longer crank shaft, and thus bring the crank case nearer to the ground, is surely not seriously put forward. The fly-wheel of all engines I am acquainted with invariably projects below the level of the crank case, and a very long stroke indeed would be required to make the crank case foul the ground before the fly-wheel did. So that, far from the centre of gravity being raised on this account, it can in reality be lowered, and the car made more stable, and less likely to skid or overturn on the road.

Vibration.—Vibration, we are told, is due to inertia of the forces of the reciprocating parts causing the crank case and crank shaft to distort and whip. This may be so in an unnecessarily long engine with only five bearings, but even in one in which the crank shaft is supported by a bearing between each crank, there can be surely little or no whip of the crank shaft. And, certainly, with a well-designed four-cylinder engine, the imaginary discomfort from engine vibration is so masked as to be a negligible quantity, and certainly should not be seriously urged as an argument against the long stroke. An advantage also of the long stroke is that when the long stroke engine is running at the same revolutions as the short, the piston speed is greater, and consequently more power is obtained, whereas to get the greatest

power with the short stroke means the reciprocating parts have to be reversed more times per minute, causing loss of power and wear and tear.

Weight of Engine.—I fear Mr. Edge has fallen into a strange error in this. I gather from his letter that he is comparing engines of equal bore as being of equal power, one to have a long stroke and the other to have short stroke. Obviously, this is not fair, and, if weights are to be compared, they should be of engines of equal power. This would necessitate that the short stroke engine would require a much bigger bore, and this would add weight out of all proportion to the reciprocating parts, which is bad. It would also add weight to the stationary parts of the engine; thus it will be seen that, power for power, the long stroke engine is no heavier than the short stroke engine, because the engine of the short stroke will have to have a bigger bore to equal it in power.

Noise from Engine (said to be due to vibration and valve actuation).—Possibly Mr. Edge's contention might be true if, with the small stroke absurdly small valves and other detrimental design were present; but, obviously, the same number of valves are operated not quite so often with a long stroke motor as with a short one. Indeed, it is one of the troubles that makers have had to surmount to get the engine revolutions of the long stroke motor as high as those of the short stroke motor; so that, if anything, the valves do not as a rule, move quite so fast.

Lack of Flexibility.—Here again, I fear, I must join issue with Mr. Edge. Some of the slowest running motors have had the longest strokes, and undoubtedly slow running and long stroke are not antagonistic for a given power with a given flywheel and a given compression. Indeed, it is questionable whether, with an engine of great power, obtained by a long stroke rather than by increasing the bore, the difficulties of starting are not lessened; because, assuming the two compressions equal on the two engines, one with a large bore and the other with a small bore,

The Photograph reproduced above depicts a Fleet of Daimler Cars all owned by Bristol Motorists. It is an interesting fact that all the owners of the cars reside within a radius of three miles of Bristol, the vehicles, with perhaps one exception, having been sold from the Daimler Company's Bristol Depot during the past three years.

then the pressure is acting in the small bore over a smaller area, and, against this, there is only the additional length of the crank for the starting handle to pull against. But, as the compression is not great or intense until near the end of the stroke, this possible disadvantage is not sufficient to neutralise what would be the pressure to overcome if acting on a much larger and proportionate bore to obtain the same power.

Danger from Pre-ignition.—I fear I cannot follow what Mr. Edge means with regard to this. I see no more difficulty in keeping an engine cool and avoiding pre-ignition with a long stroke, provided the plugs are correctly placed, &c., than with a short stroke. Neither can I see why the connecting rod should lie in a more oblique direction with the long stroke than with the short one, provided both are correctly designed.

Necessity for Stronger Shafts and Transmission.—Surely this is not a consideration that should enter into the calculations in connection with the modern motor-car. High-type steels can now be obtained that give enormous margins of safety for quite commercial weights of motor-cars. The only difficulty seems to be the question of manufacture.

Increased Wear and Tear on Tyres.—This trouble is more imaginary than real, and here again I think the transmission should be improved rather than the long stroke discarded. It has long seemed to me a crude way to transmit power from an engine through a solid shaft to the admittedly weakest portion of the car, namely, the pneumatic tyre. The designers of the Metallurgique car saw this years ago, and seriously tackled the question of a spring-drive that would absorb all unequal drive of the engine and all hard knocks that the tyre usually receives, and transform those knocks into a steady, even, elastic pull. This is the cure for the tyre bills for which Mr. Edge pleads so eloquently, not the re-introduction of the obsolete short stroke.—Yours truly,

WARWICK S. WRIGHT,

JUSTICE TO MOTORISTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am a medical man and the owner of a 10-h.p. car, which I use professionally.

I was run into by a tramway-car, and note the result. The police, at the instance of the "public," prosecute me for "negligence"; result, £4 fine and costs for going five miles an hour. By this means I am not only victimised by the courts for a thing I did not do, but I am deprived of redress in the civil courts, because it would be useless, with this conviction against me, to take proceedings.

In addition to all this injustice, I was compelled to attend twice at the courts, as the case had to be adjourned in the first instance owing to the deafness of one of the magistrates, who had been sitting and adjudicating all the morning.—Yours truly,

EDWARD A. PURCELL, L.R.C.P., &c.

TAPER CYLINDERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the last issue of the *M.C.J.* "E. T. H." advocates taper cylinders. Our experience, as specialists in restoring worn bores to a state of perfection and fitting new pistons, points to the fact that the best results are secured by making cylinders perfectly true and parallel throughout—within .001 in., but that the pistons should be slightly smaller at the upper end. The amount, of course, varies with the diameter of the bore. "E. T. H." mentions the fact of the piston making a "trip" "into a cooler part," but if he considers that it travels some 1,000 feet per minute (and much more even on some of the latest long stroke engines), he will see that the temperature of a solid plate of

metal like the head of the piston has not time to get very cool in a trip of a few inches.

It appears to us that "E. T. H." may possibly be confusing the rapidity with which gases lose heat with the comparatively long period during which solids retain it, for whilst the temperature at the end of an explosion stroke is reduced very considerably in the case of the gases expanded in the cylinder, we do not think that any loss of heat worth mentioning exists with regard to the head of the piston in a period so infinitesimal. The cylinder walls and combustion head are directly water-cooled, whereas the area of the top of the piston has a comparatively poor chance of getting benefit from same, especially as there is a film of oil (a very bad conductor) separating the piston from the cylinder.—Yours truly,

ACER, LTD.
A. E. S. Craig, General Manager.

ON Sunday evening last a lady's cape, which had been dropped from a motor-car, was found just outside of Scarborough. Mr. E. A. Hobson writes that if the owner will forward number of car and a correct description of the cape to 6, Shaftesbury Avenue, Roundhay, Leeds, he will be pleased to forward the same to them.

MR. R. G. BOOTH, of Harrow, has written to Buick Motors stating that the 15-20-h.p. Buick car he purchased some time ago has just completed 3,164 miles. On the 12th inst. Mr. Booth competed in the Motor Cycling Club's petrol consumption trial, and although he did not attempt to save petrol by stopping the engine down hill, &c., but drove consistently at about twenty miles an hour, his consumption came out at 31½ miles per gallon. Mr. Booth states that he did not adjust his carburettor for the trial, and carried besides himself his wife and boy of eight years and the official observer.

THE MOTOR UNION MEET AT OXFORD.

On Saturday the Motor Union held a provincial meet at Oxford. Some of the members reached the University City on Friday by motor launch from Reading, others by car and train on Saturday morning. St. Giles proved an excellent place for the cars, some forty of which lined the roadway near the Martyrs' Memorial and St. John's College.

The ordinary monthly meeting of the committee was held in the Municipal Buildings by permission of the Mayor of Oxford, who extended a cordial welcome to the Union.

Further consideration was given to the attitude of the public towards automobilism, and the following important resolution was passed:—

"That the Union confer with the Royal Automobile Club and the Automobile Association with a view to joint action towards more effective prevention of dust and the improvement of roads.

"That the Motor Union do contribute to the above purpose the sum of £1,000, on condition that the Royal Automobile Club and the Automobile Association will each contribute the same amount.

"That in the event of these proposals being accepted by the Royal Automobile Club and the Automobile Association, the committee think it would be reasonable for the Government to make a similar grant."

Report was made that 360 road-signs had been erected by the Union at dangerous places, and it was resolved to adopt a new special sign for erection at the entrances to concealed carriage drives.

Tom Tower, Christ Church, Oxford.

The Union agreed to make a monetary grant towards road improvements on the main road from York to Scarborough, and to the cost of a road at Barnstaple Bay.

Following the business proceedings of the day visits were paid to many of the colleges and tea was enjoyed in the hall of Lincoln College.

In the evening the dinner was held at the Clarendon Hotel, Mr. Joynson-Hicks, M.P., presiding, and amongst those present were the Mayor of Oxford (Alderman F. W. Ansell), supported by Earl Russell (vice-chairman of the M.U.), Sir Robert Buckell, Sir Walter Gray, Mr. W. Ballin Hinde, Mr. Rees Jeffreys (secretary of the M.U.), and Mr. Claude Rippon (president of the Oxford and District Automobile Club).

Mr. Joynson-Hicks, in responding to the toast of the Motor Union, and after thanking the Mayor and the Oxford and District Club (which had made the visiting motor unionists honorary members for the day), alluded to the strong recrudescence of popular feeling against motor users. This had been aggravated by three factors—the dust of an exceptionally dry summer, inconsiderate driving, and the policy of the R.A.C. in relation to the "four-inch" race. For this race the Motor Union had no responsibility whatsoever. Speaking personally, and not on behalf of the Motor Union, he entirely deprecated the race, and he believed that it had gone far to exasperate the public, which saw no reason for it. An important organisation in motordom was

undertaking a grave responsibility in allowing a race to take place in which there was a probability of serious disaster, after several accidents had occurred in practice. These racing cars were not needed, and men who went in for road-racing were not likely to make considerate drivers. Mr. Burns had no doubt been right in saying that public opinion was hardening on the question of inconsiderate driving. The Motor Union had done from the centre towards remedying the evil that which the R.A.C. asked members of local clubs to do, and he thought this a more hopeful method than that of asking individual members of clubs to inform upon one another. The police, with some exceptions, were to be congratulated upon the reasonable and conciliatory manner in which they carried out unpleasant duties, and co-operation with them was to be recommended, although there were still some magistrates who boasted of having "netted" huge sums in a day by fines in the tone appropriate to a good day's shooting or fishing. Dust was the real enemy, and the roads must be reconstructed to meet the advance of traffic, as they had been repeatedly since the days of the pack-horse. He then stated the proposal made at the committee meeting, and said that he hoped to see great results from it. It might set right with public opinion motorists who, like the members of the Motor Union, desired to use the roads reasonably and with consideration, and had no sympathy with racers or with professional tryers of fast cars on the roads.

Replying to complaints from the Motor Union respecting unrolled stones on the roads the Clerk to the Devon County Council writes that arrangements are being made with a view to avoiding stretches of roads being left with the metalling unrolled.

The Middlesex County Council is erecting a warning sign at a dangerous crossing at Mill Lane, Hanwell, across the Uxbridge road; a similar concession has also been obtained by the Motor Union where Zion House, Isleworth, enters the main London road.

In response to a request by the Motor Union the London County Council last year affixed notices to the staircases of tramcars, warning passengers to beware of other traffic when alighting. In the process of cleaning these notices became obliterated, but are now being painted on the staircases.

ROAD REPORTS.

PAISLEY.—The Town Council of Paisley have decided to apply for a ten-miles limit for motor-cars proceeding through any of the streets of the burgh. The Chief Constable has also been instructed to obtain two stop watches for the use of the police in checking the speed of motor vehicles.

HORSHAM.—So many applications for tarring the road surfaces of places within the area of its jurisdiction have reached the Horsham Rural District Council, that that authority has decided to have reports from its surveyor as to the suitability of the localities which it is proposed to tar before considering applications.

HIGH WYCOMBE.—The Town Council of High Wycombe, Buckinghamshire, having petitioned the Local Government Board to reduce the speed of motor-cars through that town—through which the main road from London to Oxford runs—to ten miles an hour, various objections have been lodged with the authority at Whitehall by the Royal A.C., the Motor Union, Alderman A. Vernon, Dr. H. J. Wheeler, and others. The Town Council at their last meeting fully discussed the matter, and directed the town clerk (Mr. A. J. Clarke) to send their observations upon the objections to the Local Government Board, pointing out that there are a great number of roads leading into the main road, which made it more necessary for the safety of the public that motorists should not be at liberty to drive at a higher rate than ten miles an hour.

LANARK.—The Highways Committee of the Lower Ward of Lanark have accepted the offer of the Scottish A.C. to provide sufficient material to coat a mile of roadway with a view to mitigating the dust nuisance. The experiment is to be made with calcium chloride supplied by Messrs. Brunner, Mond and Co., through their Scotch agents, Messrs. Arthur and Hinshaw, 88, Cadogan Street, Glasgow.

FINDON.—It is notified that the West Sussex County Council have applied to the L.G.B. for a regulation limiting the speed of motor-cars to ten miles an hour over certain portions of roads in the parish of Findon, of which details are announced. Objections may be sent to the Local Government Board on or before October 7th, and a copy should be sent at the same time to the Clerk to the County Council.

REIGATE.—The Corporation of Reigate are applying for a ten-miles limit on the following main roads:—London to Brighton via Redhill, commencing where Linkfield Lane joins the main road, through the centre of the town to the Flying Scud public-house (between the nineteenth and twenty-first milestones from Charing Cross); on Reigate Hill where Beech Road joins it, through the tunnel and Bell Street to the inn at Woodhatch.

THE exports of Stepney spare wheels for the twelve months ending August 31st last, being the end of the company's financial year were, we learn, 100 per cent. in excess of those for the corresponding period of last year. The home trade has also increased very considerably. The colonial catalogue of the Stepney Wheel Company, which has been in preparation for some time and which includes a private code specially compiled for the Stepney business, is in the printer's hands. The company intend sending these catalogues during the next two months to at least 15,000 motorists in the colonies.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE new candidates elected to the R.A.C. as individual associates include several ladies, among them: Lady Clifford, of Chudleigh; the Countess de Hamel De Manin, Mrs. Arthur Burgham, Miss Dorothy Whitney, Miss Beatrice Blair, and Miss Josephine Oakley. Lord Haversham has also become an associate, together with Sir George Armstrong, Bart., Sir George Polkington, the Rev. Joseph Wood, D.D., head master of Harrow School, Mr. E. H. Holden, M.P., and Mr. Chas. Manners, the well-known singer.

COMMERCIAL MOTOR USERS' ASSOCIATION.

At the September monthly meeting of the Executive Committee of this Association it was announced that the prize fund for good driving totalled about £32. The latest day for entry for the London competition was decided, viz., Monday next, the 28th inst.

The committee also resolved to ask Capt. Nott-Bower, Commissioner of City Police, to endeavour to supply a classified return of the street accidents in the City during the last two years.

ROADS IMPROVEMENT ASSOCIATION.

THE Roads Improvement Association (Incorporated), is arranging to exhibit at the Exhibition to be held in connection with the forthcoming International Road Congress at Paris, between fifteen and twenty samples of road materials, &c., in the space that has been placed at its

sympathy by attending in person, were Mr. Charles Hardy, the president, whose Daimler car led the procession, Dr. Hogarth, Messrs. Booth Grainger, W. B. Wells, J. Senior, A. King, J. W. Danby, H. Belcher, J. Truman, G. Cowen, and H. Stevens. Mr. T. Pyatt, the secretary of the Cripples' Guild, Mr. G. Sadler, the treasurer, Mr. F. Lees, and other members, also attended. Lieut.-Colonel Birkin, the chairman of the club committee, lent two cars.

HEREFORDSHIRE.

A SPECIAL meeting of the Herefordshire Automobile Club was held on Tuesday to consider the R.A.C. circular letter on inconsiderate driving. It was resolved to co-operate in the attempt to put down the evil. The President (Mr. Pennefather) suggested that all motor-car owners who employed drivers should give orders that the rule and ordinary courtesies of the road must be strictly observed in all cases.

HULL.

THE Hull and District Automobile Club held a speed-judging competition on Saturday last. The start was from Tranby Lane end (Anlaby), the route being Skidby, Beverley, Market Weighton, Sancton, Newbald, and Brough to Anlaby, the course being about thirty miles. Each competitor had to give his watch up before starting, the prizes going to those who most accurately travelled at the speed given them. The test varied from 15½ to 18½ miles an hour. Dr. Coates was

The Scottish Club's Cairn o' Mount Hill Climb.—A Group of the Competitors at Edzell.

[A. Ross, Stonehaven.

disposal by the Ligue Contre La Poussiere des Routes. The specimens will embrace samples of road tar treated and made with various dustless materials, and will include sections of road immediately after treatment and also sections cut from the road after a certain period of wear. The association has also appointed seven delegates to be present at the Congress, and the delegates are contributing papers for discussion at the meeting.

BROOKLANDS.

THE Brooklands A.R.C. on Saturday announced the official figures for the 60-h.p. short distance class record made by F. Newton, with a Grand Prix model Napier, on the previous day. His time for the flying half-mile was 17.61 sec., giving a speed of 102.20 miles per hour.

The previous record was 100.84 miles per hour, by D. Resta on a Mercedes car.

NOTTINGHAMSHIRE.

ON the 17th inst. the Nottingham Automobile Club held their annual outing for the crippled children of Nottingham. Sixty motor-cars were lent for the purpose of conveying 200 members of the Crippled Guild to Costock, about ten miles away. A car load of nurses from the hospitals attended to render help in case of emergency. At Costock, Mr. R. J. Bagnall-Wild looked after the arrangements, and among the Club members who not only lent their cars, but manifested their

the starter and judge, and he was assisted by Mr. Henry Strong, assistant secretary. Two prizes had been generously given by Mr. A. J. Atkinson and the Hull City Garage Company. The order of merit was as follows:—1, Mr. A. J. Atkinson (president of the Club); 2, Mr. A. T. Simpson. The other competitors in order were:—Dr. E. H. Howlett, Messrs. E. Robson and W. Fenner. The times were remarkable, as the two winners were only 2 sec. and 1 min. 10 sec. out respectively from the time required to complete the run at their allotted speeds.

SCOTTISH.

ON Saturday last the Scottish Automobile Club held a handicap hill-climbing competition confined to members of the S.A.C. and the Scottish Motor Traders' Association, up the well-known Cairn o' Mount Hill, at Clattering Brig, in Kincardineshire. The hill is 2 miles 35 yards in length, the gradient varying from 1 in 5.4 to 1 in 20. There were three classes:—(1) Cars of 12.8-h.p. and under; (2) cars up to 25.6-h.p.; and (3) cars over 25.6-h.p. The prizes were awarded under handicap on the following formula:—

Weight of car in lb.

Time in seconds \times H.P.

In Class 1, Mr. A. Hunter Crawford's De Dion was first; in Class 2, Mr. Boyd Macrae's Werbell; in Class 3, Mr. J. Hunter Steen's Gladiator. The cup, presented by Mrs. Seligman, for the best handicap result by cars having engines over 4 in. bore, was won by Mr. Steen's Gladiator. Mrs. Adams' prize for the best handicap result, irrespective of class,

went to Mr. Macrae's Werbell. The Motor Trade Association's handicap prize was won by Mr. T. Blackwood Murray's 24-h.p. Albion, with Mr. W. G. Maxwell's 22-h.p. S.C.A.T. second, and Mr. T. Shaw's 40-h.p. Ariel third.

The cars in Class I., in which two seaters were eligible, were all two seaters except the Argyll, which carried four passengers.

The following are the official results:—

| No. | Competitor. | Car. | Handicap H.P. Rating. | Time. | Figures of Merit. |
|--------------------------------------|-------------------------|-------------------------|-----------------------------|---------|----------------------|
| CLASS 1.—Cars of 12-h.p. and under. | | | | | |
| 16 | A. H. Crawford | De Dion | 10.61 | 15.58 | 190 |
| 8 | Major Fraser | Argyll | 11.98 | 14.31.2 | 180 |
| 31 | W. Renwick | Adams | 11.93 | 15.28.1 | 156 |

| SCOTTISH MOTOR TRADERS' ASSOCIATION. | | | | | |
| 21 | T. Blackwood- Murray | Albion | 31.34 | 6.39 | 268 |
| 21 | W. G. Maxwell | S.C.A.T. | 27.77 | 7.59.1 | 216 |
| 18 | W. R. Bell | Werbell | 26.21 | — | Withdrawn on hill |
| 7 | T. Shaw | Ariel | 77.42 | 6.7 | 1404 |
| 19 | J. H. Paterson | Peugeot | 28.07 | — | Withdrawn on hill |

Mr. Henderson's "Mass" was driven by Mr. Walter S. Macharg; Mr. Webster's "Talbot" by Mr. Gibbon, both members of the club; Mr. Usher's "Napier" was driven by his ordinary driver. In every other case the car was driven by the owner or a member of his family. Fine weather prevailed for the event, which attracted a large number of spectators. After the hill climb was over the competitors and their friends adjourned for tea to the Panmure Arms Hotel, Edzell, eight miles away, where the photograph reproduced on page 653 was taken.

DERBY AND DISTRICT A.C.

ON Saturday last the members of the above club held their closing competition for the present season, which took the form of a speed judging contest in lieu of the usual club run. The cars assembled at the Station Bridge at Mickleover and the route being from a point a short distance away and round a series of loop roads encircling the Radbourne and Langley districts, and so arranged as not to include any portion of the Ashbourne or Mickleover main roads. The total distance was under four miles. The course made an admirable one for the purpose, and consists of winding and narrow roads through beautifully wooded country, and as the exact route to be taken was not fixed upon until shortly before the start, competitors had no opportunity of previously traversing the course and making themselves acquainted with the hills and other difficulties to be encountered, and were thus forced to rely solely upon their judgment as to the average speed to be maintained.

The method in which the contest was run was that each competitor chose a speed at which he elected to travel up to twenty miles per hour, and this with the actual length of the course gave the time that should be taken, the error being the difference between the correct and actual time made, the competitor making the lowest percentage of time error winning. Each entrant nominated an observer, who rode in another car to point out the route and ensure that watches and speedometers were not used. It is a fact which speaks well for the careful driving of members of this club that in every case the competitors were slower than

the speed they elected to travel at, and as each car was dispatched singly, there was no passing on the course and nothing in the nature of a race; some of the cars, in fact, which had made as the drivers thought possibly too fast a speed down the hills, when coming suddenly in sight of the finishing point slowed down and crawled to the finishing line, notably Mr. D. C. Bolton (15-h.p. Standard), who in this manner hoped to neutralise what he considered had been too fast a speed, and, as a matter of fact, was coming in almost on time, and thus reduced his speed, making an error of 2.32.

The winner turned up in Mr. Herbert Jefferson, a 16.20-h.p. Humber, which it is worthy of notice he had only taken possession of during the week, his error being only 1.93.

Appended is a list of the competitors, their cars, and the percentage of error, with the actual placings:—

| Name. | Car. | Error. | Placing. |
|-------------------|-------------------|--------|----------|
| Herbert Jefferson | 16.20-h.p. Humber | 1.93 | 1 |
| D. C. Bolton | 15-h.p. Standard | 2.32 | 2 |
| B. Sadler | 8-h.p. De Dion | 2.79 | 3 |
| G. B. Fletcher | 10.12-h.p. Humber | 4.25 | 4 |
| F. A. Bolton | 15-h.p. Standard | 5.6 | 5 |
| Wm. Hart | 24-h.p. Minerva | 10.7 | 6 |
| Dr. Copestake | 7-h.p. Fafnir | 19.3 | 7 |
| C. J. Allin | 10.12-h.p. Humber | 20.2 | 8 |

Mr. Jefferson thus takes the silver medal (1st) and Mr. D. Bolton the bronze (2nd), while the Motor Union Medal, awarded for the best aggregate performances of the year, also goes to Mr. Jefferson, he being the only member who has won two first prizes in club events during the season.

The course was in admirable trim, there being an absence of dust and the weather was perfect. The results were again expeditiously worked out during the contest by the energetic hon. sec., Mr. E. H. Fryer, and the officials were:—Timekeepers: Messrs. C. J. Allin (hon. treasurer), and E. H. Fryer (hon. sec.); observers: Messrs. Wm. Hart, Dr. Copestake, E. J. Bolton, and P. E. Joule (assist. sec.)

LINCOLNSHIRE A.C.

THE last meet of the season was held at Revesby on the 17th inst., and, though the weather was threatening, there was a good attendance. The beautiful gardens and the famous shrubbery at the Abbey, the home of the Stanhopes, were thrown open to the members, and a very pleasant time was spent. Tea was taken at the picturesque Red Lion Inn.

LINCOLNSHIRE M.C.C.

A TRIP to London is being arranged for Saturday, October 24th, as a competition for the Palmer Cup presented by Mr. E. J. Mitchell, manager of the Palmer Tyre, Ltd. The members will start from the hill just outside Lincoln, and the competition will be a reliability one. A team trial for teams of four is also being arranged.

IRISH MOTOR-CYCLE UNION.

THE concluding hill climb of the season under the auspices of the Dublin centre of the Motor-Cycle Union of Ireland was held on Saturday last in Co. Wicklow, the long hill from Kilmacanogue to the top of Calary Bog being the locale. The competition was divided into two classes, non-peddalling and pedalling, and in each the awards were determined on Professor Callender's formula. In the non-peddalling Class B Dumphy (3½-h.p. Jap) made fastest time and won on formula. The same rider made fastest time in the pedalling class, but in this section he was beaten on formula by R. Walsh, who scored 268 points to Dumphy's 295. The times were taken by Messrs. J. A. Armstrong and T. W. Murphy.

THE Accrington and District M.C.C. held their first gymkhana on Saturday last.

THE Hull and East Riding Auto-Cycle Club held a pace judging contest on the Hedon Road, Hull, on Saturday afternoon.

FOR the purpose of assisting the town in the extension of its summer season, the Blackpool and Fylde District M.C. is arranging to hold a motor gymkhana at Blackpool on October 17th or 24th, and any profits are to be handed over to charitable institutions.

By courtesy of the Society of Motor Manufacturers and Traders the Automobile Association will have an imposing stand at the November motor-car show. The stand is being tastefully decorated in the A.A. colours—yellow and black—and will be easily recognised by a large model of the A.A. car badge.

ON Saturday, the 12th inst., Mr. W. Willis (chairman) and Miss Willis entertained the members of the Kent Automobile Club at "Philippines," Braisted Chart. A good number were present and all thoroughly enjoyed themselves. The Royal Hungarian Band played throughout the afternoon.

THE Victrix Motor Car Works, Kendal, are now making a speciality of a neatly-finished 3.10-h.p. single-cylinder engine, fitted with automatic carburettor and centrifugal water circulation pump. The same firm is also manufacturing an improved form of universal joint.

CASES AGAINST MOTORISTS.

TO COME UP IF CALLED ON.

At Windsor, on Saturday, Duncan Alves, of Tunbridge Wells, was summoned for driving a motor-car at twenty-six miles an hour along the Old Windsor road. Mr. Robb, who appeared for the defence, admitted a technical offence. He said his client was a keen motorist, who owned five large cars, and during the last four or five years he had travelled tens of thousands of miles in all parts of the United Kingdom, and his licence was absolutely free from stain or endorsement of any kind—almost a phenomenal record for a motorist. Having pleaded guilty, it might seem difficult to avoid a conviction, but, under the circumstances, he was going to ask the Bench to dismiss the case on payment of costs. His client would not feel a fine of £100 any more than he would a shilling, but he took a personal pride in his record, even though a conviction did not carry endorsement of the licence. After some discussion the chairman said that, in consideration of defendant's good record, the magistrates would make a distinction, and would bind him over in the sum of £20 to come up for judgment if called on within six months.

BIG BATCHES.

Several batches of motorists have recently been summoned and fined at Swindon, Stratton, Llanrwst, Epsom, Harrogate, Hexham, Christchurch, Morpeth, Helston, Cambridge, Kingstown (Ireland), Dundee, Kesteven (Lincoln), York, Chelmsford, Reigate, Newcastle and Morpeth.

THE WORPLESDON ACCIDENT.

At Woking Police Court, Max Dalloz, of French nationality, a motor-car driver in the employ of Lord Newborough, has been charged with having carelessly, negligently, and recklessly driven a motor-car and caused the death of William Larby, aged 13, at Worplesdon, on September 10th. He was remanded for a week. The magistrates remanded the prisoner to Brixton, but said that he would be liberated

AUTOMOBILE ACCIDENTS.

A SERIOUS motor-car accident has occurred on Batchworth Hill, Rickmansworth. A party of six from Worcester Park, Surrey, were descending this declivity into Rickmansworth, when the car overturned. Two of the occupants—Mr. and Mrs. Freeman, of Oak Villa, The Retreat, Worcester Park—were so seriously injured that they were removed in a critical condition to Watford Hospital, where Mr. Freeman has since died.

WHILE a motor-car was being driven from Usk to Newport (Mon.) on Saturday the tyre of one of the rear wheels burst, resulting in the car colliding with a telegraph pole. Mr. L. B. Gaunt, who was seated by the side of the chauffeur, was killed instantly, but the driver and other passengers escaped injury.

A MOTOR-BUS accident took place in Trafalgar Square, London, at the corner of St. Martin's Lane, late on Sunday night. Three people were injured, two slightly, whilst a lady sustained a fractured leg. The two buses were travelling in the same direction. The first bus started to go backwards down an incline and collided with the other vehicle.

A SERIOUS motor-car accident occurred on Monday, on Titsey Hill, near Limpsfield, Surrey, in which Mr. H. Tomalin, of Sanderstead, received injuries which it is feared will prove fatal, while Mr. Rowe, a partner in the firm of Messrs. Cooper and Co., hosiers, Nottingham, his wife, and the chauffeur were also injured. After the descent of the mile-long hill had begun the chauffeur found that the car was getting out of control. Mr. Rowe jumped out and escaped with minor injuries. After the car, travelling at a tremendous speed, had proceeded a few hundred yards, Mr. Tomalin also jumped out and sustained injuries to his skull. On reaching the foot of the hill, where there is a curve, the car dashed through a fence, knocked the stump of a tree out of the ground, and was completely wrecked. Mrs. Rowe was rendered unconscious, and she received several bad cuts about the head and body. The chauffeur was also injured but not seriously. THE coroner's adjourned inquiry at Guildford into the circumstances

The Star Engineering Company recently secured an order from Messrs. Lever Brothers, of Port Sunlight, for no less than nineteen 9-h.p. two-cylinder motor-vans. The above illustration depicts eighteen of the vehicles which have now been delivered.

on bail in his own recognizance of £100, if, in addition, two sureties of £100 or one of £200 were forthcoming.

THE BRIGHTON ROAD.

At the Haywards Heath Petty Sessions on Monday a number of automobilists were fined for exceeding the speed limit on the London and Brighton road on September 6th, the fines aggregating £70. The police had timed the cars over a distance of six miles, from Bolney to Newtimber, and the speeds ranged from 25½ to 30 miles per hour. Among the defendants was a lady, who had to pay £5 and costs.

A CHARGE OF DRUNKENNESS.

At Bromley (Kent) Police Court, on Monday, George Warden, of Battersea, was charged with being drunk in charge of a taximeter motor-cab at Chislehurst. After hearing the evidence the Bench decided to convict, and fined defendant 40s. and costs.

DANGEROUS SPEED AT NEWMARKET.

For driving a motor-car at a speed dangerous to the public, Henry Carsley, chauffeur to Mr. Ernest Terah Hooley, was fined £10 and 39s. costs and his licence suspended for a month at Newmarket Police Court on Tuesday. The evidence for the prosecution was to the effect that the car was driven along the road at Newmarket at a rate of forty miles an hour, as a result of which several racehorses were frightened and bolted.

THE "Transvaal Leader," in referring to the recent hill-climbing competition organised by the Transvaal Automobile Club, states that "Several records were put up in different ways. One is undoubtedly that of Mr. C. Saker's Star car, whose time worked out at an average of 28.1 miles per hour, the highest in the competition; the trip of three hours three minutes from Johannesburg to Ristenburg is also likely to come in the list of records for such cars."

of the death of William Larby, a schoolboy who was run down and killed by a motor-car in front of the schoolhouse at Perry Hill, Worplesdon, on September 10th, was concluded on Tuesday, when, after twenty-five minutes' deliberation, the jury found: "The death of William Larby was caused by a motor-car recklessly driven by Max Dalloz."

AUTOMOBILE INSTRUCTION.

THE prospectus of the day and evening courses of motor-car engineering of the City of Bradford Technical College reaches us from Professor G. F. Charnock, the head of that department. This includes lectures and laboratory work, drawing and sketching, and workshop practice. In the laboratory an experimental motor of 16-h.p. has been installed, and practical work will be explained and illustrated.

THE University of Birmingham is arranging for a course on automobile engineering extending over four years, the first three of which are identical with the ordinary mechanical engineering course, it being considered essential that the training of an ordinary mechanical engineer should form part of the automobile course. During the fourth year the student will take the mechanical engineering, together with lectures, laboratory, and drawing, specially directed to the automobile industry, which will include tests on steam, petrol, and heavy oil motors, efficiencies of transmissions, &c. The designing class will deal with the existing types of leading motors, together with their application to road traction, and also to the development of the marine motor.

IN winning the petrol consumption trial of the Motor Cycling Club on the 12th inst., on an 8-h.p. Rover car, Mr. J. Platt-Betts achieved the remarkable feat of averaging no less than 47½ miles to the gallon of petrol.

FORTHCOMING EVENTS.

SEPTEMBER.

26th (Sat.).—N. W. London M.C.C. petrol. quantity judging competition.

Invitation to the Kent A.C. by Mr. and Mrs. Schlenheim to Chislehurst.

Examination for R.A.C.'s driving certificates at the Adelphi Hotel, Liverpool.

27th (Sun.).—Southend M.C. run to White Hart Hotel, Braintree.

OCTOBER.

3rd (Sat.).—Brooklands A.R.C. meeting.

4th (Sun.).—Gaillon Hill Climb.

11th (Sun.).—First International Road Congress and Exhibition opens at Paris.

International long distance balloon race, starting from Berlin.

14th (W.).—Incorporated Institution of Automobile Engineers. Presidential address at the Institution of Mechanical Engineers, by Mr. Dugald Clerk, F.R.S.

15th (Th.).—Mr. Knight's Paper at the R.A.C. on "Valveless Engines."

NOVEMBER.

6th (F.).—Invitation Smoking Concert of the Stanley Cycling Club at the Queen's Hall, London, W.

14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club, Hotel Metropole, London, S.W.

20th-28th.—Stanley Show at the Royal Agricultural Hall, London, N.

26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.

28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces, India.

LIGHTING-UP TIMES—LONDON.

Sep. 26th—6.49 ... 28th—6.45 ... 30th—6.40 ... Oct. 2nd—6.35
" 27th—6.47 ... 29th—6.42 ... Oct. 1st—6.38 ... " 3rd—6.33

To find the approximate lighting-up time in September for Birmingham 9 minutes should be added to the above times, 8 for York, 13 for Manchester, and 25 for Glasgow.

COMPANY NEWS.

(In the case of New Companies the file number is given at the end of the particulars.)

G. DAVENPORT AND CO., LTD., has been registered with a capital of £7,000, to adopt an agreement with G. Davenport for the acquisition of the business carried on by him at 95, Clerkenwell Road, E.C., as "G. Davenport and Co.," and to carry on the business of manufacturers and importers of, and agents for, goods in connection with motors, motor-cars and carriages, and horological, mechanical and electrical novelties, &c. G. Davenport is governing director for life. Registered office: 95, Clerkenwell Road, E.C.

THE Lancashire Taxicab Company, Ltd., has been registered with a capital of £5,000.

LONDON AND SOUTH-WESTERN MOTOR CAB COMPANY.—£20,000 Minimum cash subscription, 100 shares. Russell House, Streatham, S.W. (99,489.)

WINDOVERS.—£38,000 (£1) (18,000 preference). To take over businesses of coach builders, motor-body builders, and harness makers carried on by W. C. Windover, as Turrill and Sons, at Long Acre, South Audley Street, and Brompton Road, London, and at Croydon, and by Charles S. Windover and Co., Ltd., at Long Acre and New Bond Street, London, and at Huntingdon. Private. 30, Long Acre, W.C. (99,511.)

AN INDIGNANT DEFENDANT.

LORD ALASTAIR ROBERT INNES-KER, of Albany Street Barracks, W., has been fined £4 and costs at Kingston, for exceeding the motor-car speed limit on the Portsmouth Road, Esher, the police giving his lordship's speed at over thirty-two miles an hour. The defendant admitted the offence, and, after having paid the fine, he tore up his summons, and tossed the pieces into the jury box as he left the court.

POLICE "CONTROLS."

THERE is a trap between the third and fifth milestone from Nairn, in the parish of Auldearn, N.B.

POLICE operations are frequently directed against motorists between Mere and Bracebridge Heath (Lincoln).

TRAVELLERS on the high road between Cumberland and the Scottish border should be careful near Kingston, Carlisle.

THE London road, Chelmsford, is again the scene of motor "controls" leading to the local courts.

RECENT Scotch motor "controls" which have been reported to us include that on the Braemar road, on the way to Aberdeen; through the village of Auchterarder, and on the road between Forfar and Perth.

BUSINESS NEWS.

THE DAIMLER MOTOR COMPANY have been honoured with the Royal appointment to His Majesty the King of Spain.

MR. F. TURNER, of Brothwood Hall, Rochdale, received delivery of a 20-h.p. Beeston Humber landaulet in April last, since when the car has run between 3,000 and 4,000 miles without a single compulsory stop.

IN connection with the recent motoring events carried out at Spa, Salon, and Mont Ventoux, Dunlop tyres met with conspicuous success. In the first named they were fitted to the Clement-Bayard car, winner of the Coupe de Spa, to the Vivinus, which made fastest time in the Coupe Pilette, and to the Nagant car, fastest time maker in the Coupe de Spa Tourisme. At the Salon meeting, Dunlops were fitted to the Mors car, first in the seventh category in the flying kilometre race, and to the first vehicle in the ninth and eleventh categories in same event, while in the Mont Ventoux hill climb they carried the car which came in first in the ninth category.

MESSRS. DAVIES, TURNER, AND CO., LTD., the international carriers, 52, Lime Street, London, E.C., sound a note of warning to motoring tourists in Italy. Very careful arrangements should be made prior to importing cars into that country, as the unfortunate owners are subject to all manner of pains and penalties if clearance through the customs be not effected by experienced clearing agents fully conversant with the rules and regulations of the Italian customs. Should it happen that a technical mis-declaration takes place, or any formality be omitted or forgotten, the authorities do not hesitate to invoke the operation of the very drastic laws which necessitate the payment of a heavy fine. A provisional permit of importation has to be obtained which is available for a period not exceeding three months, and woe betide any motorist who fails to renew the permit before its expiry, as such an omission would result in the deposit paid on entry being forfeited, and the *tassa di circolazione* enacted for the space of a whole year. Messrs. Davies, Turner, and Co., Ltd., will be glad to furnish full information to any motorist contemplating a visit to Italy.

A MOTOR meet to celebrate the fifteenth anniversary of the completion of the first petrol car by Mr. Elwood Haynes was recently held under the auspices of the Kokomo Automobile Club at Kokomo, Ind., U.S.A.

THE exports of motor-cars and parts from the United States during the seven months ending with July last only attained a value of £722,788 as compared with £849,098 in the corresponding period of 1907. England is first in the list with £273,112, Canada being second with £138,567 and France third with £102,151.

AMONG the new names added to the nomenclature of human afflictions by Dr. Thomas Oliver in his recently published book, "Diseases of Occupations," the motor-car is responsible for at least one. It is described as "chauffeur's fracture," and is the unhappy result of endeavouring to start up the engine with the ignition too far advanced. Dr. Oliver is professor of physiology in Durham University, and his exhaustive treatise on the special dangers attending each different occupation gives considerable explanation of the dangers to the wrist and forearm attending a back fire.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, OCTOBER 3, 1908.

[No. 500.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

WE understand that an Aeroplane Institute is to be formed under the auspices of the British Aero Club, with the view of providing a "flying ground" near London, encouraging the study of flight, arranging competitions, and generally forwarding the movement. Many members of the Aero Club have lately been in France watching the progress of the inventors now in that country, and endeavours will be made to bring Great Britain into similar prominence in connection with the aeroplane.

A School for Motorists.

ADDRESSING a driver of a motor-omnibus who appeared before him at the West London Police Court on Tuesday, Mr. Plowden said "this is a school for motorists," and that the defendant should have known that he was going as fast as was stated by the police. If the magisterial courts are thus to be made a kind of automobile academy, we trust that less harsh schoolmasters will be provided on many of the Benches in some of the southern courts. When will schools for policemen be established?

In Manxland.

THE race for the Tourist Trophy has, despite the rather belated moanings of certain daily and weekly journals, been run in the Isle of Man. The weather was ideal, the roads in fairly good condition, though bumpy in places, and the men as fit as medical examination could testify. The result has been a demonstration of the possibility of running a car continuously for nearly 6½ hours at a speed of over 50 miles an hour. Thirty-five cars started; during the progress of the event seventeen retired from causes fully detailed in our report on another page. Of those that survived, Mr. W. Watson's consistent driving of a car that has attracted considerable notice during the practising enabled him to achieve a popular victory. Mr. A. E. George was possibly robbed of victory by the firing of his carburettor—a snatching of reward that recalled the sensational incident of a couple of years ago. The Darracqs made a good showing, and Mr. A. Lee Guinness is to be congratulated on his success.

The Record of the Race.

THIS week we present a record of the Four-inch Race, which sets forth in a terse and lucid manner the happenings in that event. In addition to the descriptions written from two points of view, viz., the starting point, and the chief replenishing station at Ramsey, some "Echoes" on a later page have an interest for those who are concerned with all the details of automobile racing; and now that the great event is over the competitors who had ill-luck and other mishaps are asking was it worth the trouble, while the public is thinking of other things. General interest in motor-car racing is scarcely sustained from one event to another, and the Tourist Trophy

race has proved but a mild excitement. Fortunately the day was fine and the roads in good condition—facts which conspired with the caution of the drivers to reduce the risks a great degree.

The Effect of the Race.

THERE can be no question that the change in the regulations under which the Touring Trophy contest is held has this year had somewhat unexpected results. While in 1907 the main feature was a restriction in the fuel consumption, this year motor-car designers had the task of meeting two limitations—one of weight of car and one of cylinder bore. The first did not present any great difficulties, but the second was important in that it left them free scope to produce an engine which, with a four-inch bore, shall develop the maximum power. How well they have succeeded is shown in the account of the wonderful performance in the way of speed recorded elsewhere. Notwithstanding the idea which has hitherto prevailed that the longer the stroke of an engine the slower the speed, some manufacturers, by careful design and construction, have been able to produce long-stroke motors capable of running at as high a number of revolutions per minute as those with short strokes, consequently developing a considerably greater power than was hitherto deemed possible. The race, which has demonstrated, if demonstration were necessary, the futility of a horse-power rating in which the factor of stroke is ignored, will certainly give an impetus to a further study of petrol engine design, and for some time to come the question of long v. short stroke engines may be expected to be an important topic of discussion in motor engineering circles. What effect, if any, it will have on the general design of touring motor-cars remains, however, to be seen.

A Prize Parade.

THE second parade in connection with the Commercial Motor Users' Association's scheme for good driving and maintenance and the excellent condition of commercial vehicles will be held at 3 p.m. to-day (Saturday) on the Thames Embankment. We understand that a large number of entries have been received, many of the vehicles having been driven more than 40,000 miles each. The General Post Office, the South Metropolitan Gas Company, the Westminster City Council, and many of the leading commercial firms have consented to allow their vehicles to be entered in the competition, and, although we do not think Saturday is the best day that could have been selected for such a parade, the movement is certainly deserving of encouragement by all interested in the industrial side of automobilism.

Glaring Head Lights.

THE letter which appears in our Correspondence columns this week with regard to the use of large and glaring head lights on vehicles is one that comes at an opportune moment in view of the shortening days and longer evenings that are coming upon us. Not only is the inconsiderate use of the glaring head light a source of irritation to horses in town and annoyance to pedestrians, but it can become an object of danger to those

who use the roads on otherwise equal terms. So many devices are now available to motorists for minimising the glare when occasion arises that the trouble can easily be overcome, and motorists should certainly give attention to this aspect of their pastime before the winter really sets in.

Traffic at Slough.

AT the instigation of the Slough District Council, a traffic census has just been taken which is to be placed before the Local Government Board with a view to securing a ten mile per hour speed limit for motor-cars passing through the town. This shows that during the last ten years the vehicular traffic has increased 22 per cent. per hour. It is interesting to learn that a considerable decrease is noticed in the number of horse-drawn vehicles, whilst the highest number of vehicles passing through Slough in one day was 618, or an average of rather more than fifty-six per hour. There has also been an increase in the cost of cleaning and sweeping the roads, and the surveyor has come to the conclusion that the present system of road construction is quite inadequate to withstand the needs of modern traffic.

A Daimler Car in Australia.

The Hon. J. H. Keating, the Australian Minister of State for Home Affairs, has recently been visiting Western Australia. During his stay he made several journeys by motor-car, and in the above illustration he is seen in Mr. W. T. Robinson's Daimler car. Mr. Robinson himself is at the wheel, and Mr. W. N. Hedger, M.P., is seated on the right hand side of the Hon. J. H. Keating. The photograph was taken as the party were leaving Mr. Robinson's residence, "Killowen," Mount Lawley, on the Swan River.

A Committee of Public Safety.

AT a time when the public Press is teeming with suggestions for staying the progress of motor-cars, which, in the opinion of nervous persons and official authorities, are driven too fast, mention may be made of the good work done by the Committee of Public Safety organised by the Automobile Association. This was formed in May last, and a special organisation of patrols under the command of an experienced official has been devoted to the work of checking, timing, and reporting upon those vehicles which, in their estimation, were driven improperly. We understand that 200 cases of this kind were registered with the A.A., and in 159 explanations were invited. In eighty-eight instances the owners not only reprimanded their drivers, but have also expressed their regret and thanked the Association for calling their attention to the fact. In only four cases can it be ascertained that the offence has been repeated, while in five instances the driver has been discharged. Of the 159 cars reported as travelling too fast, only twenty-six belonged to the Association—a proof of the point we have frequently urged in these columns, that it is the unattached

motorist as well as those who drive trade cars who render so much harm to the industry. Those in association with the great national organisations and with the county clubs generally recognise their duty to their fellow motorists.

The A.A. Assists the Police.

IN connection with this we may mention what the police do not appear to have given credit for, that the A.A. was instrumental in tracing the suspected car in the recent Worplesdon accident. The vehicle in question passed the patrols of the A.A. at Peasmarsh, Rodboro, Thursley, Hindhead, and Rake, two of them being asked to direct the driver to Southampton. Upon the information thus available the police were able to telephone direct to those in charge of the matter and put them on the right scent—an act of courtesy that ought to do something to assist the establishment of reciprocal relations between the police and the motoring community.

Motor Signs at Devizes.

IN our last issue we referred to the little warfare which has been waged at Devizes with regard to the hanging of signs outside their establishments by motor agents. The subject has now been fully discussed by the Town Council, and the report with which we have been favoured extends to three columns of ordinary newspaper length. Apparently it all arose from some misunderstanding and is to be averted in the future by the Borough Property Committee being given authority to charge a quit rent at the rate of 1s. per annum for a square foot of each projecting sign, so that the Corporation may maintain its right to the full control of the pavement and all space on the public side of the building line. The discussion has brought out very clearly to motor agents the value of advertisement, for we find that Messrs. Willis and Sons, who have an establishment in the Market Place of Devizes, laid in a stock of motor requisites, practically none of which they sold until they erected a small sign indicating their ability to supply motorists with oils, &c. Since the erection of such an announcement they have sold as many as 270 gallons of petrol alone in one week, a definite statement with regard to the value of advertisements which should be of interest to those who are complaining of trade depression without at the same time making some real effort to attract motoring customers to their places.

Magisterial Nescience.

A "COUNTY MAGISTRATE," writing to the "Times," shows as great an absence of legal knowledge in print as many of his *confrères* exhibit when on the Bench. He declares that "motorists are a privileged class, as every driver of a horse-drawn vehicle is subject to the evidence of a single constable as to furious driving," and then he takes pen to paper again, and asks, "Why should motorists be exempt?" But are they so immune in the matter as this legal dispenser seems to think? We have reported cases in which the magistrates have accepted the evidence of a single policeman as proof of driving at "a speed dangerous to the public," even when no one but the policeman was about. True, in connection with exceeding the speed limit two witnesses are necessary, but one can secure a conviction under Section 1 of the Act. Since writing the foregoing we notice that Mr. R. Jeffreys has replied in similar vein, and we have no doubt that a majority of our readers will agree with him when he says that "so far from motorists being a privileged class they are subject to greater restrictions, heavier taxation, stricter supervision, and severer penalties than any other class of users of the King's highway." In many districts a man can knock his wife down and be mulcted in fines not exceeding 40s.; but if he ventures to travel two miles an hour quicker than the law thinks he should go, he may have to pay anything up to £20, in addition to the inconvenience of compulsory attendance at court.

Motor Drives for Nurses.

DURING the summer months the nurses in the Edinburgh Royal Infirmary and Chalmers Hospital and those of the patients who were well enough have been taken in detachments for short motor-car runs into the country. The idea originated with Dr. Alexander Veitch, Edinburgh, who gave the use of his own car and persuaded a number of other owners to follow his example. The outings, which took place weekly and which were greatly appreciated, were concluded the other day, when a party of nurses were driven out to Clifton Hall, Ratho, and entertained by Mr. Arthur Dewar, K.C., M.P., and Mrs. Dewar. The company numbered about fifty, and were accommodated in a dozen cars, owned by the following gentlemen: Dr. Morrison Milne (30-h.p. Humber), Messrs. J. D. Wallace (30-h.p. Renault), Reginald Smith (30-h.p. White steamer), John Lamb (40-h.p. Napier), James Fairbairn (20-h.p. Humber), F. B. Anderson (20-h.p. Daimler), Sir Oliver Riddell (18-h.p. Siddeley), Messrs. William Robinson (18-25-h.p. Siddeley), Adams (15-h.p. Humber), Dr. Stewart (16-20-h.p. Argyll), Mr.

THE WINNER OF THE FOUR-INCH RACE.

—●—
MR. W. WATSON has had many successes in hill-climbing competitions in this country, and has previously distinguished himself in the Rivington Pike climbs, while he took part in the races in the Isle of Man last year, and was second in the Graphic Trophy race on a 40-h.p. Berliet. In 1906 he was third in the same contest. But last week's race was his first really great test of skill and endurance. He set about the business in a very determined fashion, after a somewhat dilatory start, caused by a momentary misunderstanding of the shouting and waving that marked his setting forth. Once in the stride he never faltered. The consistency of his running may be imagined from the time occupied in completing his circuits, the slowest time being 47 min. 20 sec. in the fifth round—which, curiously enough, was the fastest of the race, and credited to George with 43 min. 15 1-5 sec.—and the speediest being 43 min. 45 3-5 sec. We had

The "Four-Inch" Race.—Molon on the Vinet at Hillberry Corner.

John Paxton (14-h.p. Argyll), and Dr. Alex. Veitch (16-20-h.p. Argyll). After tea the Rev. E. G. Lovell, of the Baptist Church, Edinburgh, moved a vote of thanks to Mr. and Mrs. Dewar, and the former in reply commended the movement and invited the organisers to make Clifton Hall their objective on other runs.

The Police and Motorists.

◆ ◆ ◆
ANOTHER instance of the injustice motorists often experience at the hands of the police came to light at Eastbourne last week, when Mr. Louis Russell, of Bexhill, was summoned before the borough Bench for driving at night on Seaside Road at a speed dangerous to the public. It was proved that the police were mistaken in identifying both the number of the car and the personality of the driver, yet in face of this and in spite of the case against the defendant being dismissed the Bench declined to grant costs against the police. It certainly seems unreasonable, not to say unjust, that the police can summon a motorist for an alleged offence, and yet when it is proved that they have made a gross error the motorist is unable to recover a farthing towards the costs he has been forced to incur in defending the case.

a chat with him on the Promenade at Douglas on the morning following the race. He had recognised the dangers of the corners, and, keeping his car well in hand at such points, had gone "all out" on the road between Quarter Bridge and Ramsey, frequently attaining a speed of 70 m.p.h. on certain long stretches. He was fortunate in having no tyre mishaps during the whole six hours his car was on the road. Although he knew his car was doing well, he scarcely realised how the race was progressing, nor was he aware of the progress made by Mr. George, of Newcastle, on his Darracq. Resolved not to take risks, he had previously studied all the details of the course, and knew how to run his car to a nicety according to the particular character of any section of the road. Mr. Watson had one or two exciting runs, with Mr. Lee Guinness hard in his wake; otherwise there was not much to tell beyond the record of the win. That in itself was a great feat.

Like some other motorists of the present day, Mr. Watson originally had dreams of law and courts, but the advent of the motor drew him into trade soon after the legalisation of the automobile. His headquarters are at Liverpool, where he directs the fortunes of Messrs. W. Watson and Co., motor agents, of Renshaw Street.

The "Four-Inch" Race.

BELOW we give the impressions of our correspondents at the leading points of observance of the great race of last week—a contest of 337½ miles on a circuit of 37½ miles, which had to be traversed nine times. Excellent arrangements were made for the conduct of the event, and Mr. J. W. Orde and his able and enthusiastic assistants are to be congratulated on the way in which the race was carried through. The winner thoroughly deserved his victory, and the consistent running of his car was a triumph of reliability that the railway train could not excel. As a team the Darracqs gave a splendid performance, all three drivers showing what pluck and adventure can do when coupled with a car of such merit; the Calthorpe, Metallurgique

tioned, and when filled with journalists and cameras were driven beyond Hillberry Corner to the starting point. The horses of one vehicle shied at a motor-car and caused the passengers to jump, or be thrown out—a piece of manœuvring that should reconcile the *Times* correspondent, who was one of the victims, to motoring for many a long day.

One race is much like another, and the scene at the start was a familiar one. The cars were drawn up in the order given in the last issue of the *M.C.J.*, with the exception that, as the Bishop of Sodor and Man observed, "the first shall be last," for Mr. H. B. Browning, of Manchester, whose Rover was No. 1, went to the end of the long thin line of cars, so as not to be in

The Scene at the Starting Point.—G. W. A. Brown just off on the Coventry Humber.

and Vinots deserved their positions, and the two latter successfully overcame difficulties that would have daunted less confident drivers than those who piloted them. For Mr. Cupper had only been on the Island a few days, and Mr. Ross Browne had had but two days' experience of the Vinot. Hard luck followed some other creditable entrants; but none will begrudge the winners their triumph—and in connection with this mention must be made of the Rudge-Whitworth wheels, which have established themselves in an indispensable position in such contests.

DOUGLAS.

Ere the clock tower of Douglas marked the hour of seven on the morning of the 24th ult., Mr. T. C. Aveling, who had been appointed Press steward, was collecting from the various hotels in the town the six score of Pressmen who were to chronicle the doings of the day. Horse-drawn brakes, with side-entrance bodies peculiar to the Isle of Man, were requisitioned,

and when filled with journalists and cameras were driven beyond Hillberry Corner to the starting point. The horses of one vehicle shied at a motor-car and caused the passengers to jump, or be thrown out—a piece of manœuvring that should reconcile the *Times* correspondent, who was one of the victims, to motoring for many a long day. One race is much like another, and the scene at the start was a familiar one. The cars were drawn up in the order given in the last issue of the *M.C.J.*, with the exception that, as the Bishop of Sodor and Man observed, "the first shall be last," for Mr. H. B. Browning, of Manchester, whose Rover was No. 1, went to the end of the long thin line of cars, so as not to be in the way of any racers who wished to pass him before Quarter Bridge. He took the whole event in a very leisurely way, and had the satisfaction of seeing the race in progress at various stages. The Rover Company had withdrawn their cars, and Mr. Browning's entry was a private one. A few changes of drivers were noted. Mr. L. Hartridge replaced Mr. A. Gaal on the Westinghouse (12A). The latter had had a collision the previous evening with Mr. T. Thornycroft's car, the latter sustaining a bent axle, and being rendered *hors de combat*. Mr. G. V. Baxendale handed his car to Mr. Thornycroft, who thus started with No. 9. Mr. Ross Browne, of Nottingham, was substituted for Mr. Gordon Usmar on the Vinot (No. 10), Messrs. Rawlinson and George changed cars, and W. G. Tuck drove the Beeston Humber in place of Mr. T. C. Pullinger, who was among the spectators at the start. Otherwise the drivers were according to the list previously given.

At 9 a.m. punctually the first car, driven by Mr. W. Watson, was sent on its way, and most of the competitors made capital starts; Mr. G. W. Brown, however, had an engine stop just off the line, and the S.C.A.T., driven by Mr. R. O. Harper, did not get quickly away. Surprise was expressed when D. Resta's engine stopped just over the starting line, but he soon got going again, and then the other competitors went well, and we had a chance of observing the clearly expressed scoring-board and other facilities provided for the circulation of news to the Press for transmission to the public. They worked admirably all day.

From 9.30 a.m. onward news came of incidents that were occurring round the circuit. First we heard that Mr. P. D. Stirling had run into a wall at Ballacraine, and, although no one was hurt, his Hutton car was out of the race. Then Mr. A. Rawlinson overturned at Ramsey, but, righting his car, was quickly under way again—a feat that was recognised when he passed the Grand Stand again nearly eighty minutes after his start. The Piccard was the next to have a mishap, and, after doing well in the first round, buckled a wheel at Quarter Bridge. A new one was substituted and the journey continued—to the

wall; K. Lee Guinness was near the Bungalow when he broke the frame of his Hillman-Coatalen; Reid was delayed by the breaking of the steering arm, which was replaced at Ramsey. A long wait succeeded, broken only by the passing of a few cars completing their earlier circuits, and news of the retirement of the Deasy driven by Mr. E. W. Lewis, the designer. It was unfortunate enough to have a broken crank shaft at Sulby Bridge, which led to the withdrawal of the car. The next news was that James Reid had repaired the steering arm of his Beeston. Humber at Ramsey and was again on the road.

Meanwhile the cars were overlapping each other, changing places in the way we illustrate in the table on page 663, which, better than any letterpress, depicts the order in which the cars progressed through the race. We heard that Mr. Robinson's Calthorpe had overturned at Brayhill, that Cupper had withdrawn, and that the Piccard was also out of the event owing to failure in the water circulation. Tuck, too, was handicapped with ignition troubles. More was to follow. 12A ran into a hedge at Glen Helen and broke a wheel. Mr. Rawlinson knocked corners off a cottage near the same place, but kept going, and

Watson, the winner, on the Hutton Car, and A. Lee Guinness on the Darracq rounding the Hairpin Corner, near Ramsey.

satisfaction of Mr. Morgan Donne, who was awaiting its passing through Ramsey. Then came the Rover, Mr. Browning reaching the Press gallery with his thumb cut in re-starting his car after a stoppage. After a delay of ten minutes he was on his way again. Mr. Moss, who had had trouble from the start, retired at Ramsey on the second circuit with three valve tappets broken. Tyres were changed on Stock's De Dion, K. Lee Guinness's Hillman-Coatalen and Hutton's car.

Thus the race progressed, with news coming along of mishaps and troubles to several of the competitors. Mr. Robinson's Calthorpe was delayed by a broken spindle, and the stripping of the timing gear of Mr. Warwick Wright's Metallurgique prevented his continuance, a similar cause leading to the withdrawal of the S.C.A.T. in the next round. By the fourth round it was possible to become interested in the leaders, and several exciting runs were witnessed. Unfortunately a broken clutch caused the withdrawal of Resta, and Mr. Stocks did not appear again after the third circuit, while Mr. Moore-Brabazon lost two hours on his round owing to a broken exhaust valve.

Of the thirty-five starters twenty-one finished the fifth round, in which George made the fastest time of the day, attaining an average speed of close upon fifty miles per hour. But the lap brought disaster to some of the competitors. Hutton ran into a

Reid's car ran into a wall at Kirkmichael, his mechanic sustaining the most serious accident of the day. Unfortunately for Roberts and Outhwaite, in completing the eighth round they came over the time limit in which to complete the last circuit, and Moore-Brabazon withdrew owing to a misapprehension, fostered partly by the delay caused by the broken exhaust valve.

Then came the final effort, and although we knew the three leaders, the result of the premier position was still in doubt. At the end of the eighth round the position was:—

| | | | | | | h. | m. | s. |
|---|----------|-----|-----|-----|-----|----|----|----|
| 1 | George | ... | ... | ... | ... | 5 | 56 | 2 |
| 2 | Watson | ... | ... | ... | ... | 5 | 58 | 4 |
| 3 | Guinness | ... | ... | ... | ... | 6 | 1 | 39 |

Despite a stop of 5½ min. at Ramsey for water, petrol and changing tyres on the seventh lap, George was thus 2 min. 2 sec. ahead on time, although Watson retained his leadership in the order of advance. Only 37½ miles had to be run, and we waited stolidly till forty minutes had elapsed; then excitement became intense. Watson came along with the easy confidence he had all along shown, his time being 45 min. 1 sec. Could that be beaten? A. Lee Guinness came next, in even better time, 43 min. 42 sec., but was 2 min. 15 sec. behind his rival on the aggregate. Still no news of George. At last—though only 5 min. 31 sec. behind the winner—he came

speeding along. It transpired that his carburettor had caught fire at Glen Helen. He dismounted and put out the flames with the help of a borrowed coat and resumed. That, and the stop for replenishment, robbed him of victory; just as he was baulked two years ago by the floorboard incident, when driving the Argyll. Then interest vanished, and although we had to stay till after 5 p.m. ere the roads were opened, the main curiosity was to see whether the Darracq team would all get home. Mr. Rawlinson's pluck secured that.

The Vinot team deserved better luck. Mr. Ross Browne drove his car into the sixth place; that driven by Mr. Outhwaite completed six rounds in good time, but trouble afterwards occurred with seized exhaust valves, which delayed him so that he was unable to finish owing to the time limit. M. Molon had changed two exhaust valves which seized and was going well when he reached the starting point again $1\frac{1}{2}$ min. too late to entitle him to run his last circuit. All the three cars were, however, in fit condition to return home by road from Liverpool.

to enable the drivers and mechanics to effect any necessary repairs, and also to take in supplies. All Wednesday night lorries loaded with replenishments, &c., continued to arrive, and when the time drew near for the race to start the place resembled the appearance of a huge motor manufactory. A large staff of mechanics was at each depot, and the place was quite a hive of industry. For both spectators and competitors alike the conditions approached the ideal. A great crowd of people lined that part of the course which passed through Ramsey, Cruickshank's Corner joining the road leading up to the mountain road proving a favourable spot. The "Hairpin Corner," now known as "The Devil's Elbow," was also the centre of great interest. The first car to arrive was Watson's Hutton (No. 2) at half-past nine, followed one minute later by A. Lee Guinness on No. 4 (Darracq). The next car to arrive was No. 9, Thornycroft. Three minutes later Hutton, on his special Hutton, No. 15, dashed through the control, going well, having accomplished the journey from Hillberry in 30 min.

Cars continued to pass through the control at frequent

Moore-Brabazon on the Metallurgique at Hillberry Corner. Three other cars are seen closely following.

In view of the discussion which has recently taken place with regard to the dimensions of the engines of the "four-inch" cars, the following table showing the bore and stroke of the vehicles which completed the race, will be of interest:—

| Car. | Bore mm. | Stroke mm. | Car. | Bore mm. | Stroke mm. |
|-----------------|-------------|---------------|------------------|-------------|---------------|
| Hutton ... | 102 | x 130 | Vinot ... | 102 | x 130 |
| Darracq ... | 100 | x 160 | Vulcan ... | 102 | x 127 |
| Calthorpe ... | 102 | x 120 | Hillman-Coatalen | 102 | x 120 |
| Thornycroft ... | 102 | x 127 | | | |

*Not made public, probably about 180 mm.

The speeds of the cars that finished were:—

| | | | |
|-----------------|-------------------------|------------------|-------------------------|
| Hutton ... | 50 $\frac{1}{2}$ m.p.h. | Vinot ... | 41 $\frac{1}{2}$ m.p.h. |
| Darracq ... | 50 | Darracq ... | 41 |
| Darracq ... | 49 $\frac{1}{2}$ | Vulcan ... | 40 $\frac{1}{2}$ |
| Calthorpe ... | 46 $\frac{1}{2}$ | Hillman-Coatalen | 40 $\frac{1}{2}$ |
| Thornycroft ... | 44 | Thornycroft ... | 37 $\frac{1}{2}$ |

RAMSEY.

I watched the race from Ramsey, and at this point of the circuit interest in the contest was augmented by the fact that it was here that the different makers had their depots,

intervals, but the irregular order in which they arrived showed that a great deal of passing must have taken place since leaving the starting point. The first incident of interest in the control took place at a quarter to ten, when Outhwaite, on a Vinot, rushed through, with Tuck's Beeston Humber a few yards in the rear. The latter gained rapidly and shot ahead of the Vinot car a hundred yards past the control. Stocks, on his De Dion, was next to appear, and reported having had to change a wheel. Rawlinson, on No. 30 (Darracq), arrived at 10 o'clock, having been delayed through his car having overturned as the result of a bad side-slip at Glen Helen. No one was hurt, but the car sustained a bent axle. Moss (Arrol-Johnston) also stopped in control to repair some valve trouble. At 10.16 Watson's Hutton passed in his second round—Guinness's Darracq being one second behind. Watson had accomplished the round from this point in 45 minutes, and George, on No. 17 (Darracq), who followed five minutes later, had completed the circuit in 44 minutes. Even at this early stage of the race it was apparent that these three cars were the leaders, with George

holding a slight advantage on time; and interest was, consequently, centred in their performances. The S.C.A.T. team were noticed to be making consistent running. Porter on his No. 11 (Calthorpe) aroused interest by his good performances and prominent position in the race, and the same could at this stage be said of the Beeston Humbers. As the race proceeded several cars were obliged to retire at this point through trouble of one sort and another. Graham's Deasy (Scarlet Pimpernel) gave up owing to his reversing gear going wrong, and Cupper's Metallurgique was in the same predicament with other trouble. Watson, Guinness and George continued to keep close together; interest had now depreciated as far as the other competitors were concerned, and the spectators awaited the return of the leaders. On the fifth round both Watson and Guinness stopped together in control to take in replenishments. It was an interesting race to get away first, and Guinness was successful through the celerity of his mechanic (Davey) and the fact that Watson experienced a little delay in getting his engine restarted. However, on the next round Watson was seen to be regaining his former position, with Guinness two seconds behind. At 12.40 Hutton dashed through on his fifth round. Passing the control he appeared to be going well, but on reaching Cruickshank's Corner a tyre burst, causing the car to swerve and collide violently with the hedge. On his eighth round Watson passed the control 1 min. 11 sec. in front of Guinness, with George 5 min. later. It was 28 min. past three when Watson arrived on his ninth and last lap, apparently travelling as fast as at any previous time.

Hearing of a rather serious accident at Michael, I proceeded to the spot, and learned that at a quarter to four Reid, on his Beeston Humber, had struck the corner of the stone hedge at the Station Road. The impact was severe, and, although the car caught the hedge broadside on, some loose stones on the top were dislodged, and two ladies who were sitting on the wall were thrown down, and for a moment or two pinned to the ground. They were, however, unhurt, and escaped with torn dresses. The car had lost little of its velocity, and cannoned off on to the opposite corner, striking the low rubble wall, knocking down six or eight feet of it. Reid was thrown on to the road, but suffered no injury, except a severe shaking. The mechanic (Guttridge) was less fortunate, and was found unconscious amid the debris of the fallen masonry, while the smashed car rebounded into the middle of the road. The ambulance party at once attended to the injured mechanic, and found on

It was nearly ten o'clock when a great shout from the entrance heralded the arrival of the winning car; the band struck up "God Save the King" and the procession of Club and Island dignitaries wended its way before the footlights. Prince Francis of Teck presided, and thanked everybody for their welcome to the motorists; then Mr. Watson was called on to receive the honour he had won, and, hoisted on the shoulders of his friends, he was carried to the platform. Calls from the audience for a speech only brought smiles, and there came the cry from a Lancashire throat "Wurs the mechanic"? It was re-echoed throughout the building, and when he, too, was hustled to the

Mr. Frederic Coleman (on the right) gives Tom Thornycroft and his amateur mechanic a reviving draught of champagne at the conclusion of the race. [Mr. J. H. Atherton. Photo by]

front, the modest confused mechanic had the heartiest greeting of the night. Messrs. Marshall and Reed received the trophies they had won in the Auto-cycle Race, and then Col. Holden explained that such contests were necessary to gain knowledge and experience, and that the risks were not nearly so great as had been represented. Mr. J. W. Orde also spoke, and the Club officials filed away, while the great audience dissolved, leaving the floor in possession of the dancers. On the following morning most of the motorists left Mona—and now Lord Raglan is consoling the islanders with the hope that they may be back again next year.

ORDER OF FIRST TEN CARS AT CONCLUSION OF EACH CIRCUIT:—

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|----|----|----|----|----|----|----|----|----|
| 17 | 17 | 17 | 17 | 17 | 17 | 17 | 17 | 2 |
| 31 | 31 | 31 | 4 | 4 | 4 | 2 | 2 | 4 |
| 18 | 4 | 4 | 31 | 2 | 2 | 4 | 4 | 17 |
| 3 | 2 | 2 | 2 | 31 | 31 | 11 | 11 | 11 |
| 14 | 3 | 18 | 18 | 3 | 11 | 38 | 9 | 9 |
| 2 | 33 | 3 | 3 | 11 | 38 | 9 | 10 | 10 |
| 33 | 18 | 20 | 11 | 9 | 9 | 30 | 37 | 30 |
| 15 | 16 | 15 | 15 | 38 | 10 | 10 | 30 | 37 |
| 9 | 20 | 24 | 7 | 23 | 37 | 6 | 6 | 6 |
| 16 | 24 | 16 | 9 | 22 | 30 | 37 | 22 | 22 |

examination that he had sustained several contused wounds about the body and was also suffering from concussion of the brain.

Prince Francis of Teck, the Lieut.-Governor, Mr. Orde, and the Lord Bishop have all called and inquired after the condition of Guttridge, who, at the time of writing, remains in a critical condition.

PRESENTATION OF THE TROPHY.

The presentation of the Trophy was the occasion of a demonstration in the Palace at Douglas, and four thousand persons cheered Prince Francis, Lord Raglan, Mr. J. W. Orde—one of the most popular visitants of Manxland—Mr. W. Watson, the winner of the trophy, his mechanic, and, in fact, everybody who appeared on the platform and did not make a long speech.

TWO-CYCLE ENGINES AND MOTOR-CARS.

NOTWITHSTANDING many attempts to introduce a petrol engine working on the two-cycle system as compared with the ordinary Otto cycle, for use on motor vehicles, there seems no immediate likelihood of the familiar type of four-cycle motor being ousted from its lofty position. Even in France, where a special trial of two-cycle engines was held about a year ago, and in which several engines gave a very good account of themselves, the position appears to be much the same as in this country. At the same time there is a fascination about a two-cycle engine which makes one wonder that more attention is not paid to it by motor-car designers and builders. Its freedom from valves, valve springs, cam shafts and other complications, the simplicity as well as the small number of its moving parts, its relatively low cost of construction, are important points. Against its advantages may be set its reputed unreliability, due principally to the poor results that have been obtained by badly-designed and cheaply-built motor-boat engines, its unresponsiveness to throttle control, and its relatively low fuel economy. These are, it seems to us, merely matters of detail which would quickly be remedied were the same attention given by designers to the improvement of the two-cycle engine as has been centred on the four-cycle.

THE SOCIAL WHIRL.

THE King journeyed from Balmoral to Dunblane on Monday to open the Queen Victoria Military School as a Scottish memorial to the late Queen Victoria. His Majesty motored from Balmoral to Blairgowrie, a distance of fifty-five miles, travelling by way of Braemar down the well-known Spittal of Glenshee.

ON Sunday the Prince and Princess of Wales, Princess Mary, and the young princes had luncheon with the King at Balmoral, and in the afternoon went by motor-car to Mar Lodge on a visit to the Princess Royal and the Duke of Fife.

FOLLOWING the example of Princess Henry of Battenberg last week, Princess Victoria of Schleswig-Holstein, accompanied by Earl Beauchamp and members of the Madresfield Court house-party, visited Gloucester Cathedral on Saturday afternoon. The party spent an hour in the cathedral, and subsequently they motored to Tewkesbury Abbey and took tea with the vicar at Abbey House.

MR. LLOYD GEORGE, accompanied by Mrs. Lloyd George and Mr. William George, arrived at Criccieth the other night by motor-car from Carnarvon. The next day the Chancellor and Mrs. Lloyd George motored through Portmadoc to Harlech for a game of golf, and apparently the right honourable gentleman is becoming as enthusiastic a motorist as is the Leader of the Opposition.

It is unfortunate that the many should suffer for the indiscretion of the few, and that several of the great pleasant roads across ducal and other estates should have lately been closed owing to the misbehaviour of a small section of people who are only capable of learning manners in solitary confinement. One of the prettiest avenues in the Fylde district of Lancashire is the Green Drive at Lytham, which has been open to motor and other vehicular traffic. In future only pedestrians are to be allowed its use, owing, it is reported, to some cabman having made use of offensive language to the Lord of the Manor, Mr. J. T. Clifton, while the latter was motoring through the Drive with Mrs. Clifton.

AT a time when motoring and motoring offences are engaging so considerable a share of public attention, an anecdote told by Lord O'Brien, of Kilfenora, the Lord Chief Justice of Ireland, the "Law Times" thinks, may well be recorded. The Lord Chief Justice spent the Whitsuntide vacation in London, and brought over his motor-car from Ireland. At Hyde Park Corner the automobile in which the Lord Chief Justice and some members of his family were driving collided with another car. The chauffeur of the Lord Chief Justice's motor-car immediately stopped its course, and entered into an animated exculpation of himself from any imputation of negligence with the policeman. The policeman came up to the Lord Chief Justice and said, "Please, sir, I don't understand one word your man is saying." "I can quite understand that," said the Chief Justice, with a grave assumption of sympathy, "the man is an Irishman, a native of Tipperary. I am myself an Irishman, the Irish Chief Justice, and, of course, both he and I only speak broken English." After a very short parley the innocence of the chauffeur was completely established.

THE scene within the Scone and Perth policies which occurred at the conclusion of the Perth Steeplechase and Hunt race meeting last week was unique in the history of the sport. Heavy rains for some days previous had rendered the ground, where scores of cars were packed, like unto a quagmire, and many of the cars became embedded in the "glaur." Lord Dunedin's car was one of the first to get stuck, and the Hon. A. D. Murray and other well-known county gentlemen put their shoulders to the vehicle to get it out of the ruts. Many visitors were in full Highland costume, and the scene as, bespattered with mud, they gained the higher ground was entertaining indeed to the onlookers.

LOLLIUS.

CONTINENTAL NOTES.

British Motorists in France.

Among the British motorists who have lately visited France with their cars are Mr. and Mrs. Jessop, London (45-h.p. Fiat); Mr. A. Lloyd, London (12-h.p. De Dion); the Marquis of Anglesey (40-h.p. Mercedes); Baron and Baroness de Forest (De Dietrich); Lady Inverclyde (60-h.p. Daimler); Mr. and Mrs. Geoffrey Duveau, London (35-h.p. Mercedes); Mr. C. Bayer, London (35-h.p. Darracq); Mr. Sairsay, London (15-18-h.p. Delaunay-Belleville).

Aeronautical News.

Henry Farman, whose aeroplane is now located at Chalon-sur-Marne, made a flight of about forty-three minutes' duration on Tuesday last. On Monday Wilbur Wright competed for the prize offered by the Commission of Aviation. He covered just over 48 kilometres in 1 h. 7 min. 11 4-5 sec. By this performance he beat by 9 kilometres his record for distance in his attempt for the prize and by 13 min. 11 sec. the record for time. Later in the day he made two flights of 13 min. and 11 min. duration respectively, each time carrying a passenger. A trial is about to be made of two German aeroplanes. One is the design of Professor Reissner, of the Technical College, Aix-la-Chapelle, and the other of an engineer at Magdeburg. It is announced that an airship of a new type is being constructed by Messrs. Siemens and Halske, of Berlin. It will be semi-rigid, and driven by four propellers instead of two.

The Coupe des Voiturettes.

The annual light car competition known as the Coupe des Voiturettes, organised by the "Auto," was held on Sunday last. The contest was open for cars up to 100 mm. bore for single-cylinder engines, to 80 mm. for double cylinders, and 65 mm. for four cylinders, the minimum weight for all classes being 600 kilogs. The event took place on a closed 50-kilometre circuit, taking in Compiègne, Pierrefonds, and Crépy-en-Valois, which had to be covered eight times, giving a total distance of 400 kilometres, or approximately 250 miles. The start took place at 7 a.m., when, of the thirty-three entries, thirty-one cars were sent off at minute intervals. At the end of the first lap Naudin, on a Sizaire-Naudin, was leading by three seconds from Sizaire on a similar car in 39 min. 58 sec. He retained the lead throughout and eventually finished in 5 h. 14 min. 8 sec., equal to 47.7 miles per hour, after having been fastest on every lap except the last, when Sizaire was slightly the better. Just as Naudin kept the lead, so did Sizaire maintain second position right from the end of the first lap to the finish. The fight for third place was very keen; at first it was announced that it had been secured by Lebouc, the other Sizaire-Naudin driver, but, as shown below, the honour fell to Goux on a Lion-Peugeot. The result was as follows:—

| Position. | Driver. | Car. | Time. | | |
|-----------|-------------|------------------|-------|----|----|
| | | | H. | M. | S. |
| 1 | Naudin | Sizaire-Naudin | 5 | 14 | 8 |
| 2 | Sizaire | Sizaire-Naudin | 5 | 21 | 20 |
| 3 | Goux | Lion-Peugeot | 5 | 43 | 30 |
| 4 | Lebouc | Sizaire-Naudin | 5 | 43 | 53 |
| 5 | Colomb | Corre La Licorne | 5 | 47 | 29 |
| 6 | Ménard | Taine | 6 | 14 | 49 |
| 7 | Sonvico | Martini | 6 | 19 | 29 |
| 8 | Beck | Martini | 6 | 19 | 43 |
| 9 | D'Avary | Guillemin | 6 | 35 | 13 |
| 10 | Richard | Martini | 6 | 36 | 16 |
| 11 | Riviere | Guillemin | 6 | 39 | 48 |
| 12 | Boillot | Lion-Peugeot | 6 | 40 | 39 |
| 13 | Roisan | Aleyon | 6 | 54 | 48 |
| 14 | Gassier | Werner | 6 | 57 | 22 |
| 15 | M. St. Marc | Aries... | 7 | 3 | 16 |
| 16 | Schweitzer | Taine | 7 | 3 | 41 |
| 17 | Giraud | Truffaut | 7 | 33 | 2 |

The team prize went to the Sizaire-Naudin firm, with an aggregate for three cars of 16 h. 19 min. 21 sec., the Martini Company being second with 19 h. 15 min. 28 sec. The result of the race has again demonstrated the wonderful possibilities of long stroke engines. The Sizaire-Naudin cars are fitted with single-cylinder motors of a bore of 100 mm. and a stroke

of no less than 250 mm. (approximately 10 in.). The Lion-Peugeot engine is 100 mm. by 200 mm. while that of the Corre is 100 mm. by 160 mm. It may be added that this is the third year in succession in which the Coupe des Voiturettes has been won by a Sizaire-Naudin car.

Racing in Belgium.

On Sunday last the Ostend Automobile Club held a motor race over a 25 kilometre course, which, starting and finishing at Ostend, took in Nieuport and Snaeskerke. The seven competitors were divided into two classes:—(1) Cars having engines of a capacity of not more than 3.75 litres (Liedekerke cup rules), which had to cover ten laps—250 miles, and (2) vehicles having four-cylinder engines of a bore of 90 mm., distance seven rounds—175 miles. In the first named section the winner was Fischer (Vivinus), his time (3 h. 24 min. 46 sec.) being equal to 61½ miles per hour. Victory in the second class went to Sauveniere on an Imperia, he covering the seven circuits in 3 h. 17 min., equal to 44½ miles per hour.

duction of motor vehicles for the transportation of milk to all the big centres in Germany will be brought up for discussion at the next annual meeting of the German Milk Dealers' Association.

A Novel Motor Fire Engine.

A somewhat novel motor fire engine has lately been added to the fire brigade equipment at Wilmerdorf, near Berlin. The machine, which was built jointly by Messrs. Gottfried Hagen, of Kalk, Cologne, and Messrs. Flader, of Johstadt, is electrically propelled, and carries a vertical boiler, engine and pump for pumping purposes. The vehicle is provided with a battery of forty cells, one charge of which enables it to run a distance of from fifteen to seventeen miles at a maximum speed of nineteen miles per hour. Two electric motors are used, these being mounted in the hubs of the front wheels.

The 1909 Prince Henry of Prussia Touring Competition.

It is proposed that the 1909 Prince Henry of Prussia Touring competition shall be under the auspices of the German Im-

The Coupe des Voiturettes.—The Arrival of the Winner, M. Naudin, on his Sizaire-Naudin Car.

Milk Delivery by Motor Vehicles.

The present method of conveying the milk consumed in Berlin from the farming centres is said to be very unsatisfactory. Not only is much time lost by the shunting of the trains in the station yard and the loading of the milk cans on to the vehicles which carry them to the distributing depots, but the distance of some of the latter from the railway station is so great that the transportation by wagon requires several hours, which considerably adds to the cost. Another disadvantage of railway transportation is the fact that large country districts at a considerable distance from railway stations are unable to send any milk to Berlin. With these various disadvantages in view, the President of the German Milk Dealers' Association, Herr J. Lulay, of Schöneberg, has made arrangements to carry out some trials of the transportation of milk by motor vehicles. Two motor-lorries with trailer, capable of carrying a total load of ten tons, are to be used for the purpose, and it is intended to carry about 5,000 gallons per day from the vicinity of Anhalt to Berlin. If the experiment proves successful, the question of the general intro-

perial, Bavarian, Austrian, and Hungarian Automobile Clubs, and that the event shall extend over six days. The projected route is from Berlin to Breslau, Brunn, Budapest, Vienna, Salzburg, and Munich, where the contest will come to an end. The hill-climbing trial will probably be substituted by a series of timed runs over measured distances *en route*. Special care will be paid in drawing up the regulations to prevent the entry of any "freak" touring cars.

Miscellaneous Items.

Among the first entries for the Gaillon Hill Climbing Competition, which is to be held on Sunday next, is Mr. Kidner's Vauxhall car.—The German Imperial Automobile Club proposes to hold a reliability trial of industrial motor vehicles in May, 1909; the event will be spread over three weeks.—It is rumoured that a large French firm of motor tyre manufacturers is introducing a wired-on tyre as a substitute for the beaded edge variety.—A few days ago the King of Italy had a short spin on a Fiat Grand Prix racer with Nazzaro at the wheel!

GOSSIP FROM PARIS.

THE regulations for the Grand Prix of 1909 are again pre-occupying the minds of French automobile manufacturers. Some people, and among them M. Arnoux, the vice-president of the Technical Committee of the French Automobile Club, would like to see the Sporting Committee make a regulation suppressing all regulations, that is to say, granting complete liberty. The adversaries of this course have, however, a good many powerful arguments against it. The race, they say, would be reduced to nothing but a doubtlessly amusing spectacle. Cars weighing 400 or 500 kilos, with a horse-power of 50-h.p. or 60-h.p., would compete with heavy vehicles weighing 1,000 kilos or more, with 120-h.p. or 130-h.p. motors. The racing cars would have two, four, six or eight cylinders. M. Faroux, a well-known technical writer, says, "Such an Omnium would be most amusing but not serious." There is much truth in his remark, and it is incontestable that during the five years preceding the adoption of the limitation of the fuel consumption in 1907 but little progress was made except in the materials of which the motors and the frames were made. In the opinion of a good many experts the fuel consumption regulation was abandoned too soon, but as a restriction of the cylinder dimensions was in 1908 substituted for it, the majority of the makers seem anxious to preserve this for next year's Grand Prix. But the important point to be settled is what that bore is to be. Is 155 mm. to be maintained,

single new cab on the streets, and the condition of their horses is as deplorable as that of their vehicles. The animals are almost all old, underfed, thin, lank, and broken kneed, while the cabs are dilapidated and dirty. Though, unlike the omnibus service, the cab industry is not a monopoly, the horse-drawn cabs will disappear from the streets of Paris all the more quickly because the motor-cab owners are reducing their tariffs, and it is announced that next winter a large number of motor-cabs will ply in the streets for hire at the same rate as the ordinary horse-drawn vehicle. As the cheapness was the only advantage the *moteur à crottin* had over the *moteur à pétrole* for cabs, the prompt disappearance of the former may be regarded as a certainty. In addition to all this the old-fashioned delivery wagons and vans, &c., are being fast replaced by self-propelled vehicles. Before very many years the "noble animal" that has rendered so much good service to man will be a rarity in the streets of Paris, where it will be chiefly used to draw the elegant carriages of the upper ten thousand when they take their drive in the Bois de Boulogne.

AN inventor who succeeds in selling his patent for a reasonable price may always consider himself lucky. Whether the companies formed to acquire them are equally so is quite another question. It is never easy to ascertain if the patent will hold good, and even if it does there is generally some way of obtaining the same result by slightly different means. I

Motoring Under Difficulties in Cambodia.—The Duke of Montpensier's Lorraine-Dietrich Crossing a River at Pneu.

or is it to be increased or diminished? The race at Dieppe last July demonstrated that the very fast cars were, so to say, the victims of their own speed. The tyres could not resist a speed of 160 or 170 kilometres an hour. Would it not be advisable to diminish the bore? A reduction to, say, 140 mm. or 130 mm. would, according to M. Faroux, have the advantage of securing the participation of a hundred or more cars in the Grand Prix of 1909, whereas were M. Arnoux's proposal to grant complete liberty to be adopted there would, he predicts, not be more than twenty cars entered for the race. The decision of the Sporting Committee on this point is looked forward to with great interest.

It looks very much as if the year 1910 would see the last of the omnibus horses, or *moteurs à crottin*, as they are called, driven off the streets of Paris by the *moteur à pétrole*. The concession of the old omnibus company comes to an end on May 10th of that year, and all those persons who have sent in tenders to the Municipal Council in the hope of obtaining the new concession propose to use only self-propelled vehicles. The transformation is to be complete. As that is the case, it is to be hoped the new omnibus company will put into service more convenient vehicles than the noisy, lumbering, top-heavy, trepidating specimens of motor-buses now employed on certain routes. As for the horse-drawn cab companies, they seem to have abandoned all idea of seeking to compete with the motor-taxi cabs. For the last two years they have not put a

think this is especially true with regard to the inventions connected with aerial navigation. For instance, Captain Ferber and several other competent authorities have assured me that even the Wrights' patents are in themselves worth but little. The name of Wright may, they admit, be worth buying at even a high price, but not their patents. Nevertheless there are already hundreds of other patents relating to aeroplanes and steerable balloons taken out by less celebrated inventors or by men who may be said to have "no name," or, at least, not a name of any marketable value. They are the persons who should rejoice at the present moment because a number of companies have been formed in France and other countries to buy up their patents. The last I have heard of is the Compagnie des Express Européens, constituted, it is said, with Belgian and German capital. The progress in aviation has within the last twelve months advanced with such giant strides that it would perhaps be rash to bet against this company and the numerous other similar societies paying a good dividend. But, however that may be, the inventors who may succeed in disposing of their patents to them must be congratulated. MARNEY.

A MOTOR-CAR gymkhana in aid of the unemployed fund was held in Dundee on the 19th ult., the use of Baxter Park having been granted by the Town Council for the purpose. The event was the first of its kind in Dundee, and attracted much interest.

THE police of Guildford are summoning for obstruction those motorists who leave their cars unattended for any length of time.

SHOWROOMS at 310A, St. Vincent Street, Glasgow, have been opened by Messrs. G. Gar-scadden and Co., who have also a motor repair shop in Bishops Street, and head offices at 40, St. Enoch's Square, Glasgow.

"DRIVE slowly past school" is the warning notice to be erected in the Church Road and in the Highlands Road, Leatherhead.

track, and especially adapted for hill-climbing, Hong Kong being a very hilly place.

THE Atlas Motor Company, of 172 and 174, Queen's Road, Peckham, S.E., are well laid out to undertake motor repairs of all kinds. The firm are also making a speciality of hiring out cars both of the pleasure and business type.

LORD GLERAWLY, who acted as mechanic to Mr. Thornycroft on the car which Mr. G. V. Baxendale was to have driven in the Tourist Trophy race, is the eldest son of the Earl of Annesley. Needless to say, he is an enthusiastic motorist.

MESSRS. G. PHILLIPS AND SON, LTD., have published another of their "finger post" strip maps to which we gave commendation on their first appearance some months ago. The new map is of the London to Exeter road, and the clear diagrammatic method will enable motorists to know the objects likely to be met with on the road, with a view to discerning the right or wrong corners to take.

in a few minutes with a damp cloth. It is unaffected by petrol, impervious to moisture, and resilient to the foot.

THE steamship "Tangemuende," arriving at King's Lynn from Hamburg, reported having picked up three motor-boats in the North Sea 200 miles east of the Wash. There were no persons on board. The derelicts were taken in tow, but two broke adrift during the night. The third, which was taken into port, has the appearance of being a river passenger boat. The nationality is unknown.

ACCORDING to the annual report of the Postmaster-General for the year ending March 31st last, motor-vans are now employed, under contract, on about fifty mail services in various parts of the country. The working of the vans shows continued improvement, and their use has resulted in an acceleration of service, besides in some cases effecting economy. Other services are under consideration, and will, it is hoped, be established during the current year.

It is proposed to start a service of electro'-buses in Loughborough and district.

MESSRS. G. JOHNSON AND SON, Mundesley-on-Sea, have installed a Harvey Frost plant for the vulcanising of tyres.

It is reported that the President of the Local Government Board will shortly receive a deputation from the R.A.C. with regard to legislative proposals in connection with automobilism.

THE "new" Zenith carburettor which has just been re-discovered was first shown in this country at the last Olympia Show, and was fully described and illustrated in our issue of December 28th, 1907.

MR. H. C. LAMBERT, whose garage and works are at Mordaunt Yard, West Street, Pimlico, and offices at 26, Pimlico Road, London, S.W., is doing good business in the sale and purchase of cars, and finds a steady demand for vehicles of high reputation in the second-hand category.

A THEATRICAL company known as the Players Company is now touring the United Kingdom, and they have selected a motor'-bus in preference to the more usual means of getting about. The vehicle, which was built by Commercial Cars, Ltd., Luton, is of 36-h.p., and carries the properties and costumes, as well as the artistes.

AN ingenious device known as a petrol economiser has lately been put on the market by Mr. S. de Beer, of 432, Mansion House Chambers, London, E.C. The arrangement, which is fitted in place of the usual petrol jet in the carburettor, is claimed to increase the mileage per gallon 50 per cent. and render the engine extremely flexible.

The 15-20-h.p. Buick Car which secured the first place in the Manufacturers' Section in the recent R.A.C. Dust Trials.

THE military aeroplane underwent a short but successful trial at Aldershot on Tuesday evening. After describing several circles over Farnborough Common the machine was sent up Farnborough Hill, and on coming down the reverse slopes the wheels were off the ground for about 100 yards. No serious attempt was made to fly, the trials being for the purpose of practising with the steering-gear.

THE new "Popular" two-seated car which the Renault firm are putting on the market for the 1909 season is fitted with a 7-8-h.p. two-cylinder engine. Ignition is by high tension magneto and the water circulation is on the thermo-syphon system, the familiar type of dashboard radiator being retained. The transmission is through a leather-faced cone clutch, three speed gear-box, cardan shaft and bevel gear to a live axle. On the top speed the drive is direct.

MESSRS. WARWICK WRIGHT, LTD., write us with regard to the Graphic Trophy and Henry Edmunds hill-climbing contests, regretting the action of the R.A.C. in cancelling the events. They point out that they went to a good deal of trouble and expense in bringing a chassis over from Belgium, and having a body fitted to it to meet the R.A.C. requirements, the vehicle being on the way to the Isle of Man before they received advice that the competitions would not be held. They suggest that the two contests should be decided in England under the auspices of the R.A.C., they maintaining that, as the Graphic Trophy is an annual event, however small the number of entries might be, it should be run off.

A FEATURE of the Scottish Club's recent hill-climb at Cairn o' Mount was the performance of a non-competing car—a Sheffield Simplex 45-h.p. six-cylinder. The car carried five officials and luggage, and went up the hill in between five and six minutes—a performance which should have seen it well placed in the competition.

A POINT in motor-cab law was decided at Marylebone Police Court last week, when the magistrate refused to grant a summons to a driver whose taximeter, by going the longer way round to the house to which he was called, had registered a charge of one shilling before his fare entered the cab. The fare refused to pay, and the magistrate's decision upheld the refusal.

THE Züst motor-car in which Signor Scarfoglio made his round the world journey was damaged by fire at Bromley, Kent, on the night of Friday, last week. The petrol was being removed from the car preparatory to its being sent to Folkestone by rail, when somehow or other the spirit became ignited. A mechanic named Maynard, from a local garage, was badly burned and had to be taken to the hospital, where he has since died.

SOME speed trials were carried out on Saturday last with the Singer 12-14-h.p. (15-9-h.p. R.A.C. rating) which proved the winner in class D in the 2,500 miles trial. The vehicle, which had been stripped for the occasion, was driven by Mr. Gerald Herbert. The first test was over one lap at Brooklands with a flying start, this being covered in 168.6 seconds, equal to 59.05 miles per hour. The second trial was over a distance of 5 miles 54.7 yards, the car accomplishing this, with a flying start, in 314.6 seconds, or at a rate of 57.56 miles per hour, an achievement which speaks well for the speed qualities of the Singer Motor Company's standard 12-14-h.p. model.

THOSE owners and drivers of motor-cars who take an interest in preserving the smart appearance of their vehicles will be interested in the new preparation known as "Rubberwhite" which has lately been introduced, and for which Messrs. Gutteridge and Zambra, Ltd., 308, Euston Road, London, N.W., have secured the sole agency. "Rubberwhite" is a liquid paint put up in tins of various sizes and intended for the renovation of indiarubber mats and tyres; it is stated to be non-inflammable, and, in addition to smartening the looks of the car, is claimed to preserve the rubber to which it is applied. The paint, which is supplied in two colours—white or grey—will be found a useful addition to the cleaning outfit.

INCREASING attention is being given to the possibilities of trolley motor'-buses or "trackless trams" as they are sometimes called, for use in this country. The system, which is already at work in various parts of the country, obviates the necessity of laying tram lines, the vehicles, while running on the ordinary road, taking the necessary current from overhead conductors the same as electric tramways. A sub-committee of the Manchester Corporation has recently been to Germany to inspect the system in operation, and as a result of the visit it has been decided to insert a suitable clause in the bill to be promoted in the next session of Parliament empowering the Corporation to run trackless trolley cars. The Dundee Corporation has also decided to adopt it on one of their routes.

THE placing of a supplementary notification to the public in certain of the motor-cabs of the General Motor-Cab Company led to a brief strike of the drivers on Friday, last week. The notice requested the "fare" to pay only what is registered by the taximeter; and also to see that any "extras" such as payment for additional passengers and luggage shall be charged on the meter by the driver at the commencement of the hiring. The men construed the first portion of the notice to mean that in future "tipping" was to be prohibited, and consequently they declined to take the cabs out, contending that without tips their wages would be entirely inadequate. A conference was arranged between the employers and the employed, with the result that the notices were temporarily removed and the drivers took out the cabs, it being understood that the general manager would have an interview with the Chief Commissioner of Metropolitan Police with the view to the wording of the notices being altered so as not to convey the impression that "tipping" was prohibited.

THE ELEMENTS OF ELECTRICITY FOR MOTORISTS.

BY H. WAYMOUTH PRANCE, A.I.E.E., A.M.I.A.E.

NO excuse is needed for writing upon this subject, as one comes across so many motorists who have such hazy notions of this all-important detail of motor-cars, and who, although willing to learn, cannot spare the time to make a proper study of the absorbing subject. Upon suggesting to such motorists that it would repay them to peruse any of the small handbooks upon electricity, the answer invariably has been that they have not time, but that, if only someone would condense into a page or so the elementary details which it is necessary to understand, they could study that and find out all that they want to know. At the suggestion of a motoring novice such as the above, I have made the following notes in popular language on just as much about electricity as a motorist must know, and no more.

Let me, first, consider the electrical units which concern the motorist; these are the ampere, the volt, the ohm, and the ampere-hour. The ampere is the unit of quantity or strength of current. We speak of an electric current of so many amperes in

Expressed simply, the effect of increased voltage or pressure is to force more amperes of current along a conductor; the effect of a resistance of so many ohms is to offer resistance to the passage of that current. Of course, it must be understood that nothing moves along the conductor—the “passage” of the current is merely a figure of speech. Thus we see that all connections must be clean and firmly made, and that all joins in a wire should be soldered, as the interposition of grease or other foreign matter, or in the case of a join, air between the two surfaces connected would add to the resistance offered to the current. In the case of that known as high-tension current, or current at an exceedingly high pressure, the pressure is so great that it will force the current across obstacles such as air, or even compressed gas, this being the action across the gap at the points of a sparking plug, hence the wires used for the conveyance of high-tension currents in ignition circuits are insulated with a very thick layer of rubber to prevent the escape of the current.

A few remarks about accumulators may be of use to the novice. Without entering into a technical description of the principle of secondary cells, it will suffice to state that an accumulator consists essentially of two plates, one called the positive and the other the negative, immersed in a solution of dilute

Two of the “Sight-Seeing” Vehicles in Buffalo, U.S.A.

much the same manner as we speak of a water current of so many gallons per minute. The volt is the unit of electrical pressure, or electro-motive force (E.M.F.); it corresponds to the pound per square inch used to denote steam and water pressures. The ohm is the unit of electrical resistance, and here we can find no corresponding unit in hydraulics. It is simply the resistance which a wire or other conductor offers to the passage of a current, the number of resistance units of an electric circuit being determined by dividing the number of volts by the number of amperes passing through the conductor. The ampere-hour is the unit of capacity of a battery or accumulator. It is the number of hours for which the battery or accumulator will supply a current of one ampere, or, what is the same thing, twice the number of hours for which it will supply two amperes, three times the time which it will supply three amperes, and so on.

The most common error one comes across in the employment of the above terms is the use of the expression “a current of so many volts.” This has no meaning whatever; the correct expression would either be a current of so many amperes or a pressure of so many volts. Another error one sometimes sees printed upon the instructions fastened upon accumulators is the somewhat misleading expression, “Capacity, so many amperes,” instead of “ampere hours.”

sulphuric acid. The result of passing a current through these plates (the positive terminal of the charging dynamo and battery being connected to the positive terminal of the accumulator, the two negative terminals also being connected together) is to effect a chemical change in the plates, which change enables the accumulator to give a current of electricity when connected to a coil or other such conductor. When the plates are in this latter condition the positive one will be of a chocolate and the negative ones of a clean lead colour. In most cells the negative plate is made up of two pieces—one placed on either side of the positive plate. One such storage cell, when fully “charged,” will give a voltage of about 2.3. Two cells connected “in series” (that is, the positive terminal of the first connected to the negative terminal of the second), as is usually done to form the ordinary four-volt ignition accumulator, will give the sum of the two voltages, thus $2.3 + 2.3 = 4.6$ volts. The positive terminals are generally painted red and marked with a +, and the negative terminal with a —. Care must be taken never to take an excessive current from an accumulator—such as by “shorting” the + and — terminals with any metallic substance; the plates are covered with paste and the violent action of an excessive current causes the paste to fall away.

(To be concluded.)

Correspondence.

(Letters to the Editor should be addressed to the offices, 27-28, Charing Cross Road, London, W.C.)

THE TOURIST TROPHY RACE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—On our return from the Isle of Man we were much surprised to learn that some erroneous information had got about with reference to the non-success of our Metallurgique cars in the above race, said to be occasioned by the fact that we have had trouble with our ignition. Allow us to state, in the first place, that our four-inch cars were fitted with Bosch magneto and E.I.C. ignitions, and both of them gave us the utmost satisfaction; in fact, Mr. Bennett, of the Bosch Company, was continually at our garage in Douglas, examining the magnetos in case any trifling adjustment was necessary, but we are glad to say that his services were not required. Mr. Hall, of the E.I.C. Company, was also in attendance, and before the race made one or two minor adjustments, but during the race itself nothing occurred so far as the ignition was concerned.

The real reason of our non-success in the event was, in the first place, the late arrival of our cars from the works in Belgium, as the slight defects which became apparent could easily have been remedied had we had sufficient time over there. As no doubt you are aware, the cars only arrived in Douglas on the Thursday night at 7 o'clock, and the following morning were out to practice, and as without a doubt the majority of the cars during the practice had similar defects which were remedied, those in our cars could also have been remedied had we had

The Metallurgique Car which was to have competed in the Graphic Trophy and the Henry Edmunds Hill-Climb, had they not been abandoned by the Royal Automobile Club.

Messrs. Warwick Wright, Ltd., built the body specially to meet the R.A.C. conditions, and altogether a considerable amount of money was expended in preparing for the race and the hill-climb.

sufficient time to do the work. We are anxious to remove any false impression as to ignition troubles in this race, and shall be greatly obliged if you can see your way to insert this in the next edition of your excellent journal.—Yours truly,

OSCAR CUPPER.

TYRE PROTECTORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. C. D. Leng's letter in last week's issue, we cannot help thinking that this gentleman is just a little bit hard to please, as most people would be more than satisfied with eighteen months' wear out of one set of tyres fitted to a 40-h.p. Fiat without a single puncture. He rightly attributes this long life to his having used them in conjunction with a complete set of Durandal non-skids, which we fitted to his chassis in December, 1906, before it left London. As regards damp, no tyre that has been in use so long would remain damp proof. Rubber washers under security bolts perish very quickly, as does the rubber washer round the valve stem, and that is where the damp gets in. Any tyre that has been in constant use on a car for six months would show considerable signs of rust on the rim. If the clips of the Durandal had really let in damp, as Mr. Leng seems to think, the fabric in the tyres would have become rotten long before eighteen months' use.

Any form of fastening independent of the rim has many drawbacks—it is a complication—which is all against the trend of motors and motoring, and from the experiments we have made we find it impossible

to find anything to compensate for the air pressure which keeps the clip so securely in its place when it is inserted in the rim. The small castings which Mr. Leng suggests would leave a space between the detachable and the wall of the tyre where mud or dust would accumulate, the clips would be constantly moving, and would inevitably jump out on a very bumpy road. We sympathise with Mr. Leng outting a new pair of tyres to pieces in 1,155 miles, and are left wondering why he discarded his Durandal non-skids just when they were most wanted.—Yours truly,

STUART MORRISON AND CO.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the letter from Mr. C. D. Leng in your issue of the 26th ult., we would point out that for some time we have made a detachable non-skid band that is attached to motor-car wheels independently of the car rim. We refer to our chain adjustment type non-skid. We found a demand for a non-skid of this type for cars with detachable rims, those using Elastes, wired on covers, &c., as in these cases there is nothing for our usual clips to hold to. We do not make a band of this type because of the moisture having any effect on the tyres in the case of our clipped on bands. We may say that we have run our clipped-on bands for thousands of miles, and when taken off there has been no more effect upon the tyre from moisture than if there had not been a band on at all. We attribute this to the fact that our clips are made of a lighter gauge steel than the ordinary non-skid and they do not push the beads so far away from the flange of the rim, and we would here point out that it is an unknown thing to us for one of our clips to break.—Yours truly,

THE LOMAX TYRE COMPANY.
(C. H. May.)

A POLICEMAN'S GUESS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would urge all motorists travelling in the district of Rollesby, near Yarmouth, to be warned, as, just after crossing Bradenwater Bridge from Repps to Rollesby, there is a smaller bridge, and from this bridge to the fingerpost No. 13 directing users of the road to Oby and Thurn there is a trap. The police allege that from that fingerpost they can see across the fields to the latter bridge and time all cars travelling along the road between those two points.

The defendant in a recent case was charged with driving to the danger of the public, and you may pretty well guess what motorists have to contend with when one of the constables, after having timed the defendant and charged him with having driven at the rate of 22½ miles per hour, when pressed in cross-examination as to the manner in which he made his calculation as to speed, most reluctantly admitted that he had guessed the speed.—Yours truly,

S. R. RHODES.

THE GLARE OF HEADLIGHTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—May we ask you through the medium of your valuable paper to advise your readers to, as far as possible, cease to use the present large headlights, many of them of great power. A most deplorable accident occurred between one of our cars and another the other night, causing serious injury to several persons, fortunately without loss of life. The light was so brilliant that our man mounted the path on his near side to avoid them. This apparently caused the car to swerve; hence the collision. It was quite impossible to see anything outside the radius of their light.

We have for the past two years ceased the use of the lamps, as we know from experience that they terrorise pedestrians and cyclists to an alarming extent, and are a source of danger to motorists who do not use them.—Yours truly,

S. F. F.

INCONSIDERATE DRIVING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Setting aside the man who would be dangerous with a gun, bicycle, motor-car or perambulator, and who obviously cannot be made an innocuous member of the community, the whole of the anti-motorist case is based on inconsiderate driving by those who, though quite safe to themselves and the public, yet drive in such a manner as to cause unnecessary dust, mud and alarm to other users of the road. No reasonable motorist will argue that this kind of driving is unknown or even very infrequent. Sometimes it is due to sheer thoughtlessness, or to the selfish enjoyment of the undeniable pleasure of speed. Increased experience, however, is bringing wisdom, and it is now rare indeed for a motorist of more than a few months standing to start out on a journey with his time table so made out that it will involve speeds that, having regard to the road conditions, are likely to inconvenience other users of the road. The remaining cause, and it is a frequent one, is the unfore-

seen, and the unforeseen is generally a delay due to tyre trouble. For there is a very great temptation when appointments have been made to make up for the time lost by an increase in speed, not to the danger of, but very much to the inconvenience of the general public.

It is here, curiously enough, that the results of motor-car racing most directly benefit the non-motoring public. For success in racing, tyre delay must be eliminated. For the protection of the public from the inconvenience of inconsiderate driving, the same condition must obtain, namely, the elimination of tyre delay. It therefore becomes a duty that each motorist owes to the motor movement as well as to the public to provide his car with one or other of the devices—and there are many—which make for this end. It may be that the general public regards devices invented for general touring, but developed and proved by racing, as associated with high speeds on the road; but, as shown above, the exact contrary is the case, and the use of such devices is evidence of consideration, in the widest sense, for others. This is especially true of the speedy-looking detachable wire wheel, which, in addition to eliminating tyre trouble, actually raises less dust than does the older form of artillery wheel.—Yours truly,

JOHN PUGH.

PETROLEUM JELLY AS A LUBRICANT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would it do to use petroleum jelly or vaseline in the gear-box of a motor-car instead of the usual grease? Any information on the subject you can give me will be gratefully received.—Yours truly,

T. W. BEVAN.

[There is no special reason why vaseline or petroleum jelly should not be used for gear cases, as it would only mean employing a lighter grade of the same base from which the best mineral greases for this purpose are prepared. Petroleum is most prolific in the various lubricating products that are obtained from it, not to mention paraffin and the distilled spirits of various specific densities. The thick yellow greases that are sold for motor-car gear-boxes are going somewhat out of vogue, and gear oils and clinging semi-fluid lubricants are found more suitable. The use of ball bearings is perhaps the chief reason, as these are best lubricated with oil. Further reasons against the use of thick greases are: The centrifugal action of the wheels throws the grease against the walls of the case, sometimes leaving the teeth dry eventually; a lot of power is absorbed in churning thick grease; and the bearings do not get so well lubricated, unless self-feeding grease-cups are fitted.]

COURTESY UNREQUITED.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—A great deal has been said about the "motor murderer" and the "garage shark." I have wondered whether the customer's views were always the correct ones, and we would therefore like your readers' opinion on the following case:—

A car stranded at 11 o'clock p.m. with no carbide in a main street with a fifteen mile journey to go that night. We went back to the garage, some two or three hundred yards, procured carbide, and as the car was starting off from Salisbury Garage noticed the back electric lamp was out. The owner was not very familiar with the wiring and we tested and found them both down. We went back to the garage again, taking a 20 amp. accumulator and lending the owner a new 40 amp. accumulator.

This was kept nine weeks, and no reply was vouchsafed to our enquiries as to whether it would be returned or purchased outright. At the end of that time the servant called and asked for the owner's 20-amp. accumulator in the afternoon; it was put on the charging board and "touched up" and delivered in the evening. A charge of 2s. 6d. was made for nine weeks' loan of our accumulator (this includes re-charging it when it was returned to us) and a charge of 9d. was made for charging the 20-amp. accumulator, making a total of 3s. 3d.

We received a letter enclosing a postal order for 3s. (the 3d. being evidently too trivial a matter to bother about) and saying "the charge is exorbitant in view of the fact that we had used the other accumulator," a statement without foundation of fact.

The only thing we are surprised at is that the accumulator is in good condition; for, as a rule, they are returned to us showing about two volts and terminals and plates badly sulphated.—Yours truly,

J. SMALLWOOD.

WELSH JUSTICE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a regular subscriber and supporter of your valued journal I would like to give publicity to a measure of justice (?) I had inflicted upon me last week, with a view of warning careful drivers touring in North Wales against any similar actions which may be taken against them.

My attention was drawn to the case outlined below by receiving a summons for reckless driving, which was alleged to have taken place a month back, and on attending the court it appears that a lady was supposed to be inconvenienced by a motor-car passing close to her, while strolling on the high road. This lady swore that the wheels of a car passed within one inch of her foot, and that it must be the car owned by

myself, as it was lettered D, although she had no idea as to the number.

Without prior knowledge of the exact nature of the charge I had to meet, it was impossible for me to procure any witnesses on my behalf besides my wife, who invariably accompanies me on our tours, and by sketches and photographs I have shown that it is physically impossible for the wheels of my car to pass within one inch (or six inches) of any person's foot without injuring them, owing to the projection of the mudguards and running boards extending some six inches beyond the tread of the wheel.

For the last three and a half years I have driven about 12,000 miles annually without a single complaint of any description. Yet the Chairman of the Bench generously declared they would let me off lightly (?) by a fine of £5 and costs and advocate's fee and suspension of licence for three months!!

Hoping you will not consider my letter too long for insertion or unduly detailed for early publication.—Yours truly,

E. H. WHEELER.

THE PRICE OF LUBRICATING OIL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I use some of your space to air a small grievance with regard to the price in some parts of the country of motor requisites, especially lubricating oil? I have recently been down into Norfolk and ran short of oil, but, on trying to buy some, found I could not get any for less than 4s. 6d. a gallon. Most of the places I tried had nothing but one-gallon and half-gallon sealed tins, which I quite understand have to be sold at that high rate to allow of any profit, but even those motor-houses that had their oil in casks or drums wanted to charge the same, and finally I had to buy it at that rate. I inquired at other places on my way up to London, and both in Suffolk and in Cambridge it was the

The Mors Car recently purchased from Mors (England), Ltd., by Sir Frederick Fryer as a present to his son, Col. Fryer, who is taking it with him to India.

same; one of the places I inquired at was kept by an official repairer to the R.A.C. and M.U. Now, I have bought oil in various counties, e.g., Surrey, Hants, Herts, Warwickshire, Lincolnshire, and Yorkshire, and have not been charged more than from 2s. to 2s. 9d. a gallon. Moreover, I can myself buy oil at from 1s. 9d. to 2s. 8d. the gallon, and presumably the trade can get it cheaper, so that it is preposterous to charge more than 2s. to 3s. for it. Of course, the price of petrol and accumulator-charging is high too, but nothing to the oil.

I hope that the R.A.C. and the M.U. can do something to alter this state of affairs, at least in the case of their own official repairers.—Yours truly,

R. ROBINSON.

THE LUBRICATION OF DISC CLUTCHES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some time ago I wrote you with reference to the lubrication of disc clutches, but omitted to add a caution as to filling the clutch too full. If an excess of oil be used, it will be found almost impossible to get the first gear into mesh when the car is stationary, owing to the fact that the discs do not separate. A pint to a pint and a half is, I believe, sufficient for any clutch of this type, and on my car with three pints I cannot get in my lowest gear when standing.

There is seemingly another bone which we have to pick with the insanitary horse, and that is the spotting and dulling of varnish. The other day I asked a varnish maker how it was possible that rain and road grit could have this effect upon coach work, and he astonished me by saying that it was not the rain and pure inorganic grit that had this effect, but the ammonia evolved from the excrement of animals, chiefly horses. As a chemist I feel that he is quite justified in making this accusation.—Yours truly,

A. DUCKHAM.

HILLS AND THEIR GRADIENTS:

THE appended list of some of the steep hills in this country, together with their gradients, will no doubt be of interest to motorists, especially to those anxious to test the hill-climbing capabilities of their cars. We shall be glad to receive from readers particulars of any hill (and its gradient) in their locality not included in the list.

| Hill. | Location. | Average gradient. |
|---------------------------|---|-------------------|
| Lynmouth ... | Ilfracombe to Minehead road ... | 1 in 5 |
| Porlock ... | Ilfracombe to Minehead road ... | 1 " 6 |
| Birdlip ... | Gloucester to Cirencester road ... | 1 " 7 |
| Paracombe ... | Ilfracombe to Minehead road ... | 1 " 7 |
| Salcombe ... | Sidmouth road ... | 1 " 7 |
| Stammerly ... | Axminster road ... | 1 " 7 |
| Edge ... | Banbury to Stratford-on-Avon road ... | 1 " 8 |
| Garrowby ... | York to Driffield road ... | 1 " 8 |
| Nately ... | Kirkby Stephen road ... | 1 " 8 |
| Sutton Bank ... | Thirsk road ... | 1 " 8 |
| Titsey ... | Croydon to Limsfield road ... | 1 " 8 |

REFERENCE has already been made to the success of Mr. T. H. Woollen's 15-h.p. Talbot at the Yorkshire A.C. hill climb. The figures relating to this competition have since been furnished by Mr. C. P. Wilson, secretary of the Yorkshire Club, and it transpires that the car has augmented its splendid performance by beating the world's record for efficiency by 1085. A claim accordingly has been placed before the R.A.C.

ECHOES OF THE "FOUR-INCH" RACE.

THE Dunlop flagmen were of great service during the practising, and the Dunlop tyres won distinction during the race, being fitted to the winning car as well as to the vehicles that were in the second and third places.

FOR the third time the Tourist Trophy has been won on "Shell" motor spirit. It was used by the winning cars in 1905 and 1906, as well as by Mr. Watson in the contest last week.

THE winning car was fitted with a "Castle" coil and a "Castle" accumulator, supplied by the United Motor Industries, Ltd.

MOST elaborate precautions had been taken by the R.A.C. to provide for the safety of the public and the competitors, and Lieut.-Col. W. M. Freeth, the Chief Constable, caused 610 special constables to be sworn in to act in connection with the race. The course was divided into twenty-one sections, each in charge of an official, these including Col. Holden, Major T. Cochrane, Capt Dyke Acland, Capt. Hume, Capt. Bagnall-Wild, Messrs. R. Todd, W. Worby Beaumont, J. Lyons Sampson, S. F. Beevor, P. Dawson, W. E. Rowcliffe, Mervyn O'Gorman and other well-known motorists. Ten ambulance stations, each in charge of a doctor, were provided, and there were thirty-eight ambulance units.

THE Darracq cars were without bonnets, and several cars had small screens in front of the steering wheel, notably Mr. J. E. Hutton's car and M. Molon's Vinot.

THE Hutton car that won the race was the heaviest engaged in the contest, weighing 2,830 lbs. The Vulcan was only 142 lbs. above the minimum weight limit of 1,600 lbs.

THE Wednesday night excursion from Liverpool brought a large contingent of workmen from Southport to watch the progress of the Vulcan in the race.

LORD RAGLAN went over the course in a motor-car driven by Mr. J. W. Orde on the day before the event. Ascending Crag Willyshill a motor-cyclist was met. The Governor's car and the cycle collided, and Mr. Cove was cut and bruised. Subsequently he recovered sufficiently to go on to Ramsey, where he joined the Governor and his party at luncheon.

THE race for the Tourist Trophy is being run over again at the Palace Theatre, London, through the medium of the Urbanora Bioscope.

THIRTEEN of the cars engaged in the Tourist Trophy race, including the winning Hutton, used the Ilo lubricating oil, which has been introduced by Messrs. Easton and Melville, and has rapidly attained distinction in the motoring world.

ONE of the smartest engineering feats of the day was performed by Mr. E. W. Lewis, whose crank shaft broke. While contemplating his ruined chance of success he bethought himself. The shaft had broken forward of the timing gear, which in the Deasy engine is located near the central bearing, and dropping out the front portion of the shaft he put back the under casing and ran his car on two cylinders. For a lap and a half he travelled thus at a speed of 35 m.p.h.

MESSRS. J. KEELE AND CO. have the Darracq cars driven by Mr. A. Lee Guinness and Mr. A. Rawlinson on view in their show rooms at 72, New Bond Street, London, W. Although Mr. Rawlinson overturned his car in the first round, and ran into a brick wall in the fifth lap, he was yet able to finish seventh and complete the unity of the Darracq team.

THE following twenty-two cars were fitted with the Rudge-Whitworth detachable wire wheels, viz.:—Hutton (3), Arrol-Johnston (3), Darracq (3), Hillman-Coatalen (2), Metallurgique (3), Thornycroft (3), Calthorpe (2), De Dion, Piccard and Vulcan.

COMPANY NEWS.

(In the case of New Companies the file number is given at the end of the particulars.)

A. DARRACQ AND CO.—A dividend on the preferred ordinary shares has been declared for the half-year ending September 30th, making a distribution of 10 per cent. for the year.

AEROPLANE ENGINE COMPANY, LTD.—Capital £2,225. Registered offices, Redbridge, Southampton.

A.B.C. CAB COMPANY, LTD.—Capital £200,000. To establish services of taximeter motor-cabs in London and the provinces. Registered offices, 21, Great Winchester Street, E.C.

NEW registrations at Somerset House include the Earl's Court Motor Garage Company, Ltd., with a capital of £1,050; the Two Wheel Motor Car Syndicate, Ltd., with £600, and C. E. Whittaker, Ltd., with a capital of £100.

VANGUARD.—A meeting of the Vanguard Motor-Omnibus Company was held on Tuesday in London, when it was resolved to confirm the resolution to wind up the company, Mr. W. B. Peat being appointed liquidator.

MR. T. GARNER, 12, Peter Street, Manchester, has been appointed the agent for the B.S.A. cars in that district, while the Glasgow agency is in the hands of the St. Vincent Motor and Cycle Company, Ltd., 161 North Street, Glasgow.

CLUBS AND ASSOCIATIONS.

ROYAL.

ON Thursday, the 1st inst., the R.A.C. General Committee held the first meeting that it has convened in London since June, when the question of inconsiderate driving was again considered.

Upwards of 1,800 associates' badges have been issued to individual associates and to the members of the local clubs.

THE MOTOR UNION.

As a result of representations by the M.U., steps are being taken to trim the hedges on portions of the Reigate-Dorking road.

Following a letter addressed to the Manager of the Croydon Tramways, as to a 3-in. gap in the metals opposite the Thornton Heath depot, and many other places where the aperture is dangerous to motor vehicles with tyres smaller than 65 mm., the Union is informed that the dangerous place at Thornton Heath has been repaired.

The M.U. has received £17 during the past week towards the Legal and Legislative Defence Fund. To defray the expenses incurred this year some £500 is required.

BROOKLANDS.

ENTRIES closed on Saturday for the race meeting at Brooklands on October 3rd. The Brooklands Grand Prix has fallen through. The motor-cycle race has received the best support of any event, twenty-eight machines being on the list. The entries are as follows:—

The Autumn Handicap.—A. Van Hoboken, 35.7-h.p. Mercedes; C. Hobson, 48.6-h.p. Brasier; H. G. Nalder, Germain Yellow Peril; R. Creyke, 8.9-h.p. Sizaire; Sir G. W. Abercromby, 58.1-h.p. Fiat; O. S. Thompson, Austin Poble; C. A. Bird, 34.5-h.p. Mercedes.

The Large October Sweepstakes.—Sir G. W. Abercromby, 58.1-h.p. Fiat; H. G. Nalder, Berliet Grayling; W. Jochems, 48.6-h.p. Mercedes; O. S. Thompson, Austin Poble.

The 26-h.p. Championship.—J. W. Stocks, 25.6-h.p. De Dion.

The Motor Cycle Handicap.—J. C. Davis, 5-h.p. Rex; G. Gibson, 3.4-h.p. Triumph; W. L. R. Moorhouse, Jap; F. G. Andreae, 5-h.p. Rex; G. Schink, 8-h.p. N.S.U.; G. Schink, 2.4-h.p. N.S.U.; G. Schink, 6-h.p. N.S.U.; W. H. Wells, 5-h.p. Vindeo Special; H. G. Partridge, 6-h.p. N.S.U.; W. M. Partridge, Minerva; W. W. Genn, Minerva; W. H. Bashall, 3.4-h.p. Triumph; R. M. Brice, 3.4-h.p. Brown; H. H. Bowen, L.M.W.; H. Shanks, jun., 2.4-h.p. Chater-Lea; F. Toman, Laurin and Klement; H. V. Colver, Matchless; E. W. Caswell, 2.4-h.p. machine; F. Eagles, N.S.U.; A. J. Sproston, 5-h.p. Rex; A. G. Forster, 7-h.p. N.L.G.; A. Cumming, 3.4-h.p. Givandan; C. R. Collier, Matchless; H. A. Collier, Matchless; T. H. Tessier, Bat; R. O. Clark, 5-h.p. F.N.; Phil Cater, 2.4-h.p. Minerva; M. Arnott, Chater-Lea.

The Fifth All-Comers' Handicap Sweepstakes.—F. R. Fry, 59.6-h.p. Mercedes; Sir G. W. Abercromby, 58.1-h.p. Fiat; H. G. Nalder, Germain Yellow Peril; J. B. Hissey, Aster Queenie; C. Hobson, 27.9-h.p. Nagant-Hobson; C. Hobson, 48.6-h.p. Brasier; L. Squire, 18.8-h.p. Straker-Squire; H. P. Martin, 38-h.p. M.A.B.; W. Jochems, 48.6-h.p. Mercedes; C. J. Ratcliff, 25.6-h.p. Beeston-Humber; R. Creyke, 8.9-h.p. Sizaire; Hon. L. Bruce, 48.6-h.p. De Dietrich; C. E. Whittaker, 27.9-h.p. Imperia; G. C. Colmore, 14.7-h.p. Beeston-Humber; O. S. Thompson, Austin Poble; R. Lascelles, two 5-h.p. Varsity cars.

WILTSHIRE.

THE annual gymkhana was held on the 23rd ult. on the private cricket ground at Leighton Park, Westbury, a course for the purpose having been prepared and kindly lent for the second time by Mr. W. H. Laverton.

A programme of six events was arranged, and was carried out expeditiously and without a hitch by the officials concerned, namely, Messrs. Palairt, Laverton, Meek, and Erskine. The results were as follows:—

| Event. | Winner. |
|---------------------|----------------------|
| Adam and Eve Race | Mr. S. J. Applegate. |
| Tortoise Race | Mr. F. B. Oldfield. |
| Passenger Race | Mr. E. T. Shorland. |
| Academy Race | Mr. S. J. Applegate. |
| Potato Race | Mr. S. J. Applegate. |
| Tilting at the Ring | Captain Colston. |

A meeting of members was previously held on the question of affiliation, it being resolved, before coming to a decision, to send delegates to the proposed conference organised by the Manchester A.C.

NORTHAMPTONSHIRE.

A MEETING of the committee of the Northamptonshire A.C. has been held at the George Hotel, Northampton, when it was reported that the Manchester A.C. had asked for an expression of opinion as to the advisability of holding a conference of provincial clubs for the purpose of considering the relationship existing between the R.A.C. and the M.U. The hon. sec., Mr. Sidney Harris, was asked to reply to the effect that the committee was not disposed to take any action beyond that of "supporting the R.A.C. in whatever course they decide upon."

MOTOR.

ON Tuesday a meeting of the General Committee of the Motor Club was held for the election of new members, and on the following day the Entertainments Committee discussed their arrangements for the winter.

The club has been presented with a series of aeroplane photographs by Mr. H. O. Mack.

CAMBS AND ISLE OF ELY.

THE committee met at the University Arms Hotel, Cambridge, on Saturday, Mr. Douglas Newton in the chair. Letters from the secretary of the Royal A.C. were read and discussed. The scheme put forward by the Club to check inconsiderate driving was welcomed as a step in the right direction, and the secretary was instructed to report that the committee would carry out the main details of the scheme to the best of its ability.

The future action of the club with regard to affiliation was discussed, and it was decided, as a preliminary step, to ascertain the views of members by means of a postal vote. Each member is to be asked to answer "Yes" or "No" to the following questions:—1. Are you in favour of affiliation with both the R.A.C. and the M.U., if this can be carried out? Failing this, or if you do not approve of it:—2. Are you in favour of association with the R.A.C. alone? 3. Are you in favour of affiliation with the M.U. alone?

DUBLIN AND DISTRICT MOTOR CYCLE CLUB.

ON Saturday afternoon the Dublin and District Motor Cycle Club carried out a penalty competition over a circular course of about forty-five miles. The starting point was at Inchicore, and the finish at Terenure, the route covered being by Naas, Ballymore, Eustace and

The 30-40-h.p. Ariel Car fitted with Park Phaeton Body by Salmon and Sons recently supplied to Lieut.-Col. C. W. Coote, of Creaton, Northampton.

The leather hood and falling glass screen behind the driver completely closes the rear part of the body for wet weather. The high front wind doors also add greatly to the comfort of the forward seats.

Blessington. The competitors were required to cover the distance at a speed of between twenty and eighteen miles an hour, and any excess of the minimum time of 2 h. 15 min., or the maximum time of 2 h. 30 min., was penalised, as also were any involuntary stops en route. Although the weather was fine overhead, the roads were very greasy owing to the previous day's rain, and, in consequence of side-slips, only one of the competitors succeeded in doing a non-stop run. The result of the trial was as follows:—

| | Time. | |
|---|-----------|---|
| | hrs. min. | |
| F. J. Walker, 5-h.p. Rex, non-stop | 2 17 | 1 |
| J. Doleman, 3.4-h.p. Rex, two stops | 2 19 | 2 |
| R. H. Toaffe, 3.4-h.p. Triumph, one stop | 2 32 | 3 |
| T. Geoghegan, 3.4-h.p. Triumph, one stop | 2 53 | 4 |
| M. J. Chambers, 2.4-h.p. F. N., three stops | 2 50 | 5 |

Mr. J. Browne acted as starter and timekeeper.

NORTH BERKSHIRE.

THE North Berks A.C. hill climb took place on Saturday last at Woolstone, by invitation of Mr. and Mrs. Butler. The result of the handicap was as follows:—Mrs. Viner Ellis, 12-h.p. Peugeot; E. W. Bond, 7-h.p. Peugeot; Captain Loder Symonds, 8-h.p. Peugeot; Mrs. Barnett, 15-h.p. Fiat; W. S. James, 20-h.p. Rothwell (fastest time); Miss C. Fletcher, 14-h.p. James and Browne.

Mrs. Viner Ellis holds the silver challenge cup for the second time, having won it last year. The fastest time was made by Mr. W. G. James on his 20-h.p. Rothwell, who came up the one in six gradient in under a minute—a very fine performance. Of the heavier cars, Mr. Barnett's 15-h.p. Fiat came up in excellent style. After the hill climb

a gymkhana was held on Woolstone Lodge. The first event, Academy Sakes, driving round and drawing on a blackboard, was won by Miss Butler. The second event, Victoria Cross Race, in which three dummies had to be separately fetched and placed in the car, was won by Captain Loder Symonds. The Chauffeurs' Race proved a victory for Judge Bacon's chauffeur.

THE Crewe and District Motor Club is holding a Petrol Consumption Trial to-day (Saturday). A gold medal presented by the president, Mr. J. J. Verdin Cooke, will be given to the competitor accomplishing the greatest distance on a given amount of petrol, which will be supplied at the rate of $1\frac{1}{2}$ pints per 300 lb. total weight.

THE Auto Cycle Union is holding a Penalty run at Woodford to-day (Saturday). A meeting will be held at Leamington on the 10th inst. The Council will meet in the afternoon, and in the evening a dinner will be held, to be followed by a smoking concert.

THE next ordinary meeting of the Society of Engineers will be held on the 5th inst. at the Royal United Service Institution, Whitehall, when a paper will be read on "The History of Mechanical Traction on Tramways and Roads," by Mr. H. Conrad, A.S.E.

THE Wiltshire Automobile Club held a successful gymkhana at the Leighton Cricket Ground, Westbury, on Wednesday of last week.

PUBLIC SERVICES.

THE motor-bus service at Birmingham has come to an end, eight motor-buses and four motor char-a-bances having been sold last week at an average price of £50 each.

THE Chief Commissioner of Police suggests in a report to the Public Control Committee of the L.C.C. the employment of a "governor" or automatic speed recorder. He also suggests an increase in the number of street refugees, as providing places of safety for

Mr. G. Hill, of Brighton, at the wheel of the 8-10-h.p. Darracq on which he won so many prizes last year at the Worthing and Eastbourne Gymkhanas held by the Sussex Automobile Club. Mr. Hill, who is the local agent for Darracq and Minerva cars, is now running six Darracq cabs in Brighton.

pedestrians, and so breaking up the traffic that excessive speed will be possible only with difficulty.

BRISTOL will soon have a number of motor taxi-cabs in service. The Tramways and Carriage Company have entered this field with several up-to-date motor vehicles.

THE Hove Council has declined to licence the motor-cabs of the Provincial Motor Cab Company, Ltd., to ply for hire in Hove, apparently because they are licensed in Brighton. Instructions have therefore been given that a number of vehicles are to stand just at the boundary of the two places, and on being telephoned to at their garage (No. 5050) the company undertake to dispatch cabs to any house in Hove, within one mile of that boundary, free of charge.

A NEW development in the motor traffic of London comes in the inauguration of a system of season tickets by the Great Eastern (London) Motor Omnibus Co.

THE Cardiff Tramway Company proposes to inaugurate a motor-bus service between Llandaff and Cardiff.

WITH Lord Mountmorres as chairman, and Mr. Augustus Pereno as managing director, the Zust Motors, Ltd., has been formed to take over the sole agency for Great Britain and Ireland for the Zust cars. The company are temporarily located at 104, Long Acre, London, W.C., pending the completion of their new West End showrooms.

MESSRS. HODGSON AND STEAD, LTD., Egerton Ironworks, Salford, are making a speciality of a self-contained drawbridge for weighing motor-loeries and other industrial motor vehicles. A large number have already been supplied to millowners in Lancashire, while an order for one has just been secured from the Hampton Urban District Council.

CASES AGAINST MOTORISTS.

A CHARGE OF MANSLAUGHTER.

Max Dalloz, chauffeur to Lord Newborough, was committed for trial at the Guildford assizes in November, by the Woking magistrates, on the 24th ult., on the charge of driving a motor-car in a reckless manner and causing the death of William Larby, a schoolboy, aged twelve, at Perry Hill, near Worplesdon, on September 10th. Bail was allowed, prisoner in the sum of £100 and two sureties of £50 each or one in £100.

ADJOURNED TILL AFTER CIVIL ACTION.

A sequel to the motor-car collision at Chailey on the 2nd ult., when Julia Marchioness of Tweeddale was injured, has been heard at Lewes Petty Sessions, when Mr. Keith Lucas, of Forest Row, and John Crowley, of Warringlid, were summoned by the police for driving motor-cars negligently, having regard to all the circumstances of the case. Mr. W. J. Disturnal, barrister, who appeared for Mr. Lucas, at once applied for an adjournment pending the settlement of a civil action in the High Court, of which the collision was the subject. A writ had been issued in the High Court against his client, and there would be a cross-claim by Mr. Lucas and the lady who was riding with him. Any decision which the Court might come to must seriously prejudice the case in the High Court; therefore he submitted that, under the circumstances, the police prosecution should be delayed. The Bench agreed that the case should come into the list after the judgment of the High Court.

LICENCE SUSPENDED.

At Southwell Petty Sessions, William Birkett, motor driver to Mr. L. R. Starkey, of Norwood Park, has been summoned for driving a motor-car to the danger of the public. Witnesses estimated the speed at from twenty-five to forty miles per hour. The defendant, who had been twice previously convicted, was fined £10 and costs, and the magistrates also suspended his licence for six months. Notice of appeal was given.

A VICTIM OF AN ERROR OF JUDGMENT.

Brentford magistrates have concluded the hearing of a summons against Henry H. Sawyer, of Bethune Road, Stamford Hill, for driving a motor-car to the common danger, at Ealing, on July 28th. The accused was defended by Mr. Staples Firth, the case having been before the Court on two previous occasions. A great deal of conflicting evidence was heard, and Mr. Montgomery, in giving the decision of the Bench, said that they had the independent evidence of bystanders, which they could not ignore. The defendant was no doubt the victim of an error of judgment, and the fine would only be 10s., but a sum of six guineas must be paid in respect of costs.

NOTICE OF APPEAL.

Henry Hedges, chauffeur to Viscount Ridley, was charged, at Newcastle, on Saturday, with having driven to the danger of the public at Seaton Burn on September 4th. Mr. Clark, for the defence, said they did not admit the rate of speed complained of, and suggested that there had been some mistake made in timing the car. Mr. Riversdale Grenfell said he was in the car at the time of the alleged offence, and it was not being driven at more than ten miles an hour. Lady Ridley remarked at the time that the car could not possibly have been exceeding the speed limit. Viscount Ridley said his chauffeurs were perfectly well aware of the police trap at Seaton Burn, and they had special instructions. Defendant had driven for him continually for the past four years, and there had been no complaint against him. The Chairman intimated that the magistrates by a majority considered the case proved, and inflicted a penalty of £3 and costs. Mr. Clark gave notice of appeal.

CYCLISTS V. MOTORISTS.

At Colchester Lieut. D. W. G. Leigh-Pemberton has been charged with driving a motor-car in a dangerous manner, and also for not keeping the car on the left side of the road, at Colchester. Mr. H. W. Jones prosecuted on behalf of the Cyclists' Touring Club; and Mr. F. S. Collidge defended.

It was stated that as Mr. H. M. Velton, of West Ealing, was cycling from Colchester to Harwich defendant's car came out suddenly from behind a van and knocked him down, smashing his bicycle and causing him personal injuries.

The Bench considered that the right of way in this case belonged to the cyclists, and that the car should not have passed the van when it did. They fined defendant £5 and costs in the first case and dismissed the second.

A DUAL SUMMONS.

At Rugby, Captain Wilson was summoned for driving a motor-car at a speed exceeding twenty miles an hour, at Hillmorton, on August 5th, and there was a further summons against him for not producing his licence when so requested. Defendant pleaded guilty. It was stated that the car covered a measured quarter of a mile on the road near the Rugby Polo Ground at the rate of thirty miles an hour, and that when the licence was asked for, defendant said his chauffeur had left it in the pocket of another coat. It was now stated that, after all, the licence was in a pocket on the car. For exceeding the speed limit defendant was fined £5 and costs 17s. 10d., and on the second summons he was merely ordered to pay the costs.

AVOIDING ENDORSEMENT.

At the Rolleston Petty Sessions, Percival Platt, a chauffeur, was summoned for driving a motor-car at a speed dangerous to the public on

the highway at Reppe, on the 7th ult. Mr. S. R. Rhodes, of Wolverhampton, defended, and made a strong defence, coming into close discussion with Col. Edis, who was on the bench, with regard to the value of speed indicators in connection with gauging the speed of motor vehicles. After a short consultation the magistrates retired and decided to fine the defendant £1 and costs. Mr. Rhodes thereupon asked them to increase the fine so that he could appeal; or dismiss the case on payment of costs and allow the defendant to contribute a guinea to some local charity. After a short consultation the magistrates decided upon the latter course, specifying that the motorist must contribute a guinea to the funds of the Yarmouth Hospital. He thus avoids the endorsement of his licence.

BIG BATCHES.

Several batches of motorists have, during the past week, been summoned for exceeding the speed limit and for driving to the common danger at Mortlake, Barnet, Kingston, Leeds, Guildford, Arundel, Steyning, Elgin, Chelmsford, Newcastle, Cambridge, Croydon, Doncaster (forty-seven fines imposed aggregating £127), Woking, Grantham (thirteen cases producing £64), Ripon, Raglan and Perth.

POLICE "CONTROLS."

A POLICE quarter of a mile trap at Clifton-with-Salwick, near Kirkham, resulted in four motorists being fined the other day.

ROAD REPORTS.

DINGWALL.—A correspondent writes that in the floods a few weeks ago the bridge at Strathory, three miles south of Aulnamain Inn, was carried away, and to go from Dingwall to Lairg, Sutherlandshire, it is necessary to go round by Tain, an extra thirteen miles.

ETON.—The highway expenses of the Eton Rural District Council have nearly doubled within the past five years, and the Council has appointed a special committee, consisting of some of its members who own motor-cars, as well as some who do not, with a view to consider the steps to be taken towards a reduction in the cost of the maintenance of the roads.

HERTFORD.—The Local Government Board have issued an order limiting the speed of motor-cars through the streets of Hertford to ten miles an hour. A similar order applies to the thoroughfares through Hoddesdon and the parish of Hertingfordbury. The new order comes into operation on Monday next.

SHEPPERTON-ON-THAMES.—Objections have been lodged to the proposal to fix a ten-mile speed limit from Halliford Green to Ferry Lane, in the parish of Shepperton-on-Thames, and the L.G.B. have directed an inquiry to be held on the subject.

HAYWARDS HEATH.—Haywards Heath is to be added to the Mid-Sussex towns which favour the tar painting of road surfaces as the best antidote to the dust nuisance. While surrounding authorities have

A Public Motor-Car Service in Russia.

The first public motor-car service in Russia has lately been started in Moscow, where two Laurin-Klement ten-seated vehicles are now running between the Petrowski Park and Glebowa. The above illustration depicts the scene on the inauguration of the service, the Governor of the Province being on board the car.

A MEASURED quarter of a mile on Harlow Hill, near Harrogate, is being used by the police to catch speedy motorists.

POLICE officers are stationed at Gamston (Nottinghamshire) on the outlook for those who travel quickly.

THE trap in the Ewell Road, Ewell, has been in frequent operation of late.

A QUARTER-OF-A-MILE on the roadway outside Cambridge has been measured off for the trapping of speedy motorists.

THE Woking "control" has been frequently in operation during the last few days.

A POLICE-TRAP at the foot of Tillybaccart Hill, in the Coupar-Angus district, is proving profitable to the Forfarshire exchequer.

MESSRS. JOHN BARKER AND CO., LTD., of Kensington, W., have recently introduced a new non-skid tyre, known as Barker's All-British, which appears to be well worthy of the attention of motorists.

THE Imperia car, the British agency for which has been taken up by Mr. C. E. Whittaker, will make its first appearance in England at Brooklands to-day (Saturday).

previously adopted tar, Haywards Heath has preferred the calcium chloride treatment, but next year tar is to be substituted throughout the town.

CALNE.—The county surveyor of Wiltshire has informed the Calne Rural District Council that the length of the Bath road between Calne and the Marlborough boundary is very uneven on the surface. He suggests that the depressions which he has noticed should be patched with tarred stone without delay in the interests of the traffic in the district.

ISLE OF WIGHT.—An increase of 1½d. in the pound, levied by the guardians of the Isle of Wight, is attributed by the chairman to the development of motor traffic in the island.

FELIXSTOWE.—The East Suffolk County Council has applied for a ten mile limit for various roads in the urban district of Felixstowe and Walton.

MESSRS. WILFRID FOULIS, LTD., 122, George Street, Edinburgh, the Scottish agents for Porthos cars, ask us to state that the failure of Messrs. Colin Defries, Ltd., the British concessionaires, has in no way affected the French works.

FORTHCOMING EVENTS.

OCTOBER.

- 3rd (Sat.).—Brooklands A.R.C. meeting.
 4th (Sun.).—Gailon Hill Climb.
 10th (Sat.).—Walthamstow Motor Club run to Hunsdon.
 Auto Cycle Union's Council Meeting at Leamington.
 11th (Sun.).—First International Road Congress and Exhibition opens at Paris.
 International long distance balloon race, starting from Berlin.
 14th (W.).—Incorporated Institution of Automobile Engineers. Presidential address at the Institution of Mechanical Engineers, by Mr. Dugald Clerk, F.R.S.
 15th (Th.).—Mr. Knight's Paper at the R.A.C. on "Valveless Engines." Cycle and Motor Trades Benevolent Fund Banquet.
 17th (Sat.).—Auto Cycle Union quarterly trial—Uxbridge to Banbury and back.
 24th (Sat.).—Motor Parade and Gymkhana of the Blackpool and Fylde District M.C. at the Agricultural Show Ground, Blackpool.

NOVEMBER.

- 6th (F.).—Invitation Smoking Concert of the Stanley Cycling Club at the Queen's Hall, London, W.
 13th-21st.—Olympia Motor Show, London.
 14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club, Hotel Metropole, London, S.W.
 20th-28th.—Stanley Show at the Royal Agricultural Hall, London, N.
 26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.
 28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

- 23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

| 4th—6.31 | 6th—6.26 | 8th—6.22 | 10th—6.17 |

To find the approximate lighting-up time in October for Birmingham 6 minutes should be added to the above times, 2 for York, 8 for Manchester, and 14 for Glasgow.

CASES DISMISSED.

AT ABERGELE, on the 24th ult., Major Tayleur, of the Shropshire Yeomanry, was recharged, after the Bench had disagreed, for dangerously driving a motor-car, it being alleged that he covered 348 yards in 20 seconds, the time being by an ordinary lever watch. The Bench, on hearing that the police did not stop defendant, dismissed the case, adding that the police should always stop cars which they considered were being driven dangerously. Inspector Tippet replied that all depended on circumstances. The police were governed by the Act of Parliament. Col. Mellor, the presiding magistrate, remarked that common sense as well as Act of Parliament had to be considered, and held that defendant did not drive dangerously.

AT EASTBOURNE, last week, Louis Russell, of Station Road, Bexhill, pleaded not guilty to driving a motor-car in Seaside Road at a speed and in a manner dangerous to the public on September 4th. P.C. Reader Gray stated that while on duty near the Albion Hotel about 11 p.m. he saw a red car—A.P. 939—going in the direction of the Leaf Hall at a very fast pace and on the wrong side of the road. On September 14th he went to Bexhill and identified the defendant as the man who was driving the car. In answer to the chairman, Mr. Cruttenden said the defence was practically one of "mistaken identity." The defendant stated he had held a licence to drive a motor-car for the past ten years. He detailed his movements during the two days previous to September 4th, on the evening of which he was at Bexhill. About half-past nine he went to his home after transacting some business and then left to go to the Constitutional Club. Defendant's evidence was corroborated by his wife and a man named William Ranford, who was on the club premises at the same time as defendant—about 9.30 to 10.45. Other witnesses for the defence were present, but the chairman remarked that it was evidently a case of mistaken identity and the charge would be dismissed. Mr. Cruttenden, on behalf of Mr. Russell, then applied for costs. After a short deliberation the chairman stated that although he was very sorry for the defendant for the trouble and expense he had been put to, they could not grant costs.

THE decision of the directors of Humber, Ltd., to close the Beeston Works and concentrate the whole of the manufacturing operations at Coventry has led to the entire re-organisation of the clerical staff, which will now be under one roof, and naturally necessitates the company dispensing with the services of a number of good and reliable clerks. The secretary of Humber, Ltd., asks us to mention that should any of our readers require typists, bookkeepers, &c., he will be glad to recommend some of those who are leaving the firm through no fault of their own.

AUTOMOBILE ACCIDENTS.

WILLIAM JONES, who lived at Ynysboeth, Glamorgan, was walking home with his wife late on Saturday night from Mountain Ash when he was run down by a motor-car belonging to Messrs. Nuth Brothers, of Penrhiwceiber. Mr. Nuth and the chauffeur, Frederic Tuck, took him to a surgery, but he was killed instantaneously. It is stated that the car was proceeding at a moderate speed, and the accident happened as Jones was crossing the road near his house.

SHORTLY before midnight on Thursday week Captain Blockley, of Wellington, was riding home on his motor-bicycle from Allscott, through Wrockwardine to Wellington, when near the town he encountered three horses on the road. One lashed out, kicking the cyclist off his machine, the handle bars of which were broken and the lamp smashed. This is another instance in which the horse was to blame.

AN accident occurred on the main road between Burton Latimer and Finedon, by which a blind organ-grinder, named Hull, had a leg broken. The organ, drawn by a donkey which was led by another man, was proceeding up a steep hill, outside the village, when a motor-car coming down the hill caught the axle of the organ and smashed it to atoms. Hull, who was walking behind the organ, was flung on the grass at the side of the road. He was removed to Kettering Hospital. The occupants of the car rendered every possible help to the unfortunate organ-grinder.

WHAT was called a motor-car accident at Stretford on Saturday was investigated by the Manchester coroner on Monday. A boy had been knocked down by a car, and after hearing the evidence the coroner said most of the street accidents were caused by people running from behind hurries into the roadway, and it behooved drivers to be particularly careful when passing stationary vehicles. They should slow down, and see if they could see anybody about to cross the roadway. The jury returned a verdict of "Accidental death," and exonerated the motor driver.

AT an inquest at Bolton, on Monday, into the death of a cyclist who had collided with a car belonging to Mr. J. A. Bright, M.P., a verdict of "Accidental death" was recorded, the coroner observing that no blame attached to the driver.

JUDGE EMDEN received a scalp wound on Tuesday evening as the result of a collision between two motor-cars on Farnborough Hill, between Sevenoaks and Bromley. The judge was being driven home to Bromley, when at the cross-roads his car came into collision with another motor-car going in the direction of Orpington.

A WARNING TO HORSE DRIVERS.

WILLIAM GEARD, of Shepherd's Bush, was summoned at Brentford, last week, for obstruction at Northolt Road, Ealing; and, on a second summons, for abusing Mr. John L. Granville Sharpe, an Oxford undergraduate. According to the evidence, Mr. Sharp was motoring in Northolt Road, and the defendant and others were driving brickcarts. As Mr. Sharpe's car passed the defendant's cart the latter drew in, causing a collision. When spoken to, the defendant used foul language. About £3 damage was done to the motor-car. The defendant denied using abusive language, and alleged reckless driving on the part of the complainant. A fine of 10s. was imposed for obstruction, and 7s. 6d. for the abuse, and a guinea costs.

BUSINESS NEWS.

WE learn that Mr. Thornton, of Messrs. Perry, Thornton and Schreiber, Ltd., 117, 118, 119, Long Acre, London, W.C., has just returned from America, where he has been making arrangements with the Ford Factory for the supply of new models for the English market for 1909. While the two and three seated cars will be the same as at present, a five-seated touring car and a landaulet are also to be introduced. These will be fitted with a four-cylinder engine of 20-h.p. having a bore and stroke of 3½ in. by 4 in.

THE Radio Welding and Motor Engineering Company, whose new works are in Oldridge Road, Balham, S.W., have installed a large and up-to-date plant for the Radio process of fused welding of all kinds of metals, motor-cylinders, crank cases and parts. The firm have discovered a new flux, which, combined with the above process, is claimed to give far better results than any other system. In addition to the welding department they have a special plant for the thorough overhauling and re-magnetising of all makes of magnetos, and for the repair of coils and accumulators.

THE London, Bath and Bristol Motors, Limited, is the name of a new concern which has just been formed, with a capital of £25,000, to acquire freehold premises in the rear of the Royal Hotel, College Green, Bristol; freehold premises at Bath known as Nos. 7, 8, 9, 10, and 10A, James Street, W.; workshops known as Kears Motor Garage, Nelson Street, Bristol, together with the plant, machinery, tools, and stock-in-trade in connection with the business now carried on upon the premises by Mr. F. Hudson Smith. It is intended to erect a garage in the rear of the Royal Hotel, Bristol, upon the site above referred to. Arrangements have been made with Messrs. Spiers and Pond, Ltd., whereby the garage in Bath has been appointed the official one of the Empire Hotel. Negotiations are also in progress for the acquisition of a garage in the West End of London.

COMMENTS.

THE Congress which will assemble at Paris on Monday to consider—quoting from the official programme—"the fitting up of roads, suiting them to the new means of locomotion," has international importance in view of the common problem with regard to road traffic now affecting all nations alike. The fact that France can present the delegates from other countries with such an excellent object lesson as is given in its highway system makes the selection of Paris the most suitable point that could have been suggested for the first International Congress of this character. In this country the maintenance of the highway has been largely a haphazard matter, and we would commend the advocacy of a National Road Department which is made in our columns by the Hon. Arthur Stanley for the consideration of British authorities who may not be represented at the International Congress. Practically every European country will have delegates, and not the least important section of the programme is that of the excursions arranged to visit the various specimens of main roads near the French capital. Among the British associations that are sending delegations are the R.A.C., the M.U., the Roads Improvement Association, the County Councils Association, and the organisations of the road surveyors of the United Kingdom. A mass of valuable information has been collated for the edification of the delegates, and it is to be hoped that they will return to their respective countries with a clear and definite proposal to place before their Governments. We would suggest that, for example, the various representatives of the half-dozen English associations that are sending spokesmen should meet and arrive at some definite proposal which all could advocate, so as to secure its practical realisation in the minimum time. Apparently everything tends at present in the direction indicated by Mr. Stanley, and it would be a great step forward if the various organisations could come to a decision along similar lines, and strongly urge the proposal for the development of a great national Department which should allocate the funds.

The Late Sir George Livesey.

SIR GEORGE LIVESLEY, whose death took place on Sunday morning at his residence at Reigate, was a keen motorist, and recognised not only the saving of time made possible by the motor-car but also the commercial possibilities of the heavy motor vehicle. In Saturday's parade on the Thames Embankment one of the lorries of the South Metropolitan Gas Company, Ltd., of which he was chairman, was a participant, the driver securing a second prize for the condition in which it was kept. Sir George had a strong personality, and in the course of sixty years' service with the gas company had done much for modern industry, while his advocacy of the automobile in his later years proved the alertness of his mind and assisted the movement in a very material degree. He had for some years been a vice-president and a life member of the Motor Union, and was also one of the oldest subscribers of the *M.C.J.*; in fact, in a letter we received from him a few weeks before his death,

Sir George wrote, "I am a constant reader of the *M.C.J.*, and am glad to bear my testimony to its excellence in every way as to general motoring news and information, and to the character of the correspondence and the very useful hints that are a prominent feature."

Motor Horns not Musical.

APPARENTLY the authorities of the Sheffield Musical Festival are not inclined to recognise the motor horn as an instrument likely to add to the harmony of their proceedings. Three years ago, when the Festival was then in progress, "some of the most beautiful effects at the close of the concerts were ruined by motor horns," and the danger of disturbance this year, according to Mr. T. Walter Hall, the chairman of the Festival Committee, "is infinitely greater owing to the increasing number of motor-cars." Hence the appeal to owners and drivers of such vehicles not to sound their horns and sirens in the neighbourhood of the Albert Hall when the Festival is in progress. The same advice might also be tendered for application outside churches and chapels on Sundays.

"Whereabouts" in London.

AT length it has dawned upon the London County Council that an authoritative and up-to-date map of the Metropolis would be useful to the citizens of London, and this is, we understand, in preparation at Spring Gardens. Hitherto there have been few satisfactory street maps of the Capital, and not long ago the chairman of an important committee of the Westminster City Council obtained from a peripatetic vendor of literature outside the office in the Charing Cross Road, W.C., the best map of Westminster he had seen. But municipal authorities should not be dependent on such wayward examples of private enterprise, and the location of streets and roads on official maps should be seriously taken in hand, possibly in conjunction with the Ordnance Survey, although that is a point we would not press too closely. Mr. G. S. C. Swinton suggests that this should be a "locomotion" map "to show everybody how to find their way everywhere." His idea is that London should be divided into squares of a quarter of a mile, so that it should be possible by means of the numbered divisions to easily locate any particular point or place.

Suppressing the Inconsiderate Driver.

THE scheme for dealing with Inconsiderate Driving which has been prepared by the Royal Automobile Club has been well received by the county clubs, several of which have now come to a definite decision with regard to the proposals outlined in the scheme. In order to put the proposals effectively into operation in its own county the Westmorland Automobile Club has divided its sphere of operations into six divisions and has appointed three members living in each section to carry out the necessary work. The North-Eastern A.A., which is really a federation of motorists on the north-east coast, has expressed sympathy with the efforts, as have also the Essex County A.C. and the automobile clubs of Huddersfield, Kent, Cambridgeshire, Lancashire, Norfolk, and Northamptonshire, as

well as the Midland organisation. Recently two or three motorists have obtained an unenviable notoriety on account of the number of times they have appeared before the magistrates, and possibly the names of a few others may occur to the R.A.C. These will afford material for demonstrating to the public the real desire on the part of motorists to show how thoroughly they are out of sympathy with those who take little heed of other users of the road. The time has come when the expulsion of some of the inveterate offenders from the ranks of the clubs and associations would have a good effect on public opinion generally.

The Rule of the Road.

HAVING regard to the law relating to the proper side on which to pass tramcars and to recent contrary decisions on the matter, the Legal Committee of the R.A.C. have sought to find a satisfactory case which might be taken on appeal to the High Court, in order that a definite decision on the legal point might be obtained. Such a case has now arisen, and the committee have agreed to contribute ten guineas towards the cost of the appeal.

Touring in Colorado.—At the Cliff Dwellers' Ruins, Manitou.

Inquiry at Newhaven.

ON the 1st inst. Mr. F. J. Willis, on behalf of the Local Government Board, held an inquiry at Newhaven into the application of the East Sussex County Council for a speed limit of eight miles per hour for motor-cars passing along the Brighton to Eastbourne main road running through the urban district of Newhaven. Mr. E. D. Dean opposed on behalf of the R.A.C. and Mr. Rees Jeffreys for the Motor Union. In support of the application Mr. Edward Knightley submitted a record of the traffic at two spots in the High Street on September 26th and 27th from 8 a.m. to 8 p.m. This was as follows:—

| | Oxley's Corner. | | Swing Bridge. | |
|--------------------|-----------------|-------------|---------------|-------------|
| | Sept. 26th. | Sept. 27th. | Sept. 26th. | Sept. 27th. |
| Pedestrians ... | 8,180 | 3,680 | 6,354 | 3,568 |
| Motor-cars ... | 30 | 39 | 27 | 33 |
| Motor-cycles ... | 3 | 5 | 3 | 5 |
| Cycles ... | 351 | 125 | 386 | 149 |
| Perambulators ... | 225 | 29 | 135 | 38 |
| Other vehicles ... | 425 | 29 | 414 | 33 |

P.-s. Vine, who thought that a motor speed limit was necessary, acknowledged that on the whole motor-car traffic through Newhaven had been conducted in a satisfactory manner. P.-s. Waghorn, whose name is "familiar in our mouths as household words," expressed the view that cars from the Continent, conducted through the town by foreign chauffeurs, were often driven recklessly. Mr. Jeffreys was prepared to agree that one of the corners suggested was dangerous. Mr. Dean, who urged that

the speed limit would not help the matter at all, did not object to one of ten miles an hour from the top of the hill to the river. The inspector is now considering the evidence and his report will be issued in due course.

The Rural View.

ON Monday an important conference of representatives of various district councils in the counties of Essex, Cambridge, Hertford and Suffolk was held at Saffron Walden, when resolutions were adopted advocating that the sequel to the conviction of reckless driving of motor-cars should be the suspension of the licence for not less than three months. It was also resolved that applicants for motor-car licences should give evidence of ability to drive, and that owners should have their vehicles taxed on a sliding scale according to horse-power. This triple resolution is, of course, to be sent to the Government, and will doubtless have some support among those who represent agricultural constituencies where the bucolic mind has not yet grasped the national advantages of the automobile. We record these resolutions as indicating the kind of suggestions that are likely to be frequently heard, both in and out of Parliament, during the next few weeks.

An Urban Conference.

RURAL authorities having thus conferred, those representing city and urban communities about London are now arranging for similar gatherings. Invitations have been issued for a conference of a private character to be held at the Mansion House (London), on Monday next, to consider the latest legislative steps to be taken with regard to motor traffic in the City. Should, as is very likely, it be determined to promote such legislation, Mr. A. J. Balfour, as senior member for the City of London, would be asked to take charge of the measure. On the 27th inst. a further conference on the same subject will be held at the Mansion House at the invitation of the Road Union. This will endeavour to form a Committee to organise public opinion against privileges being extended to motorists, and generally to voice the anti-motoring attitude.

The Minister and the Motor.

WE had thought it was generally agreed that the addition of a motor-car to the equipment of the minister was accepted by all reasonable persons as essentially in keeping with modern ideas. So many Bishops have lately been presented with automobiles, and the Rev. R. J. Campbell having attended the King's Garden Party in a motor-car, should have been sufficient to have satisfied Churchman and Nonconformist alike—without mentioning General Booth's motor-car reliability trials. The presentation of a motor-car to the Rev. Dr. Campbell Morgan, of Westminster Chapel, by a member of his congregation has revived the controversy, and some of the papers have been asking whether the motor-car is consistent with ministerial dignity. Seeing that it enables the owner to visit a large number of persons in a shorter space of time, and thus adds to the efficiency of the service rendered, we will dismiss the subject with an affirmative reply.

The L.G.B. Circular.

THE moderate and sensible letter which the Local Government Board have issued to the county and other authorities throughout the country seems to have somewhat surprised many of the anti-motorists and people like Lord Willoughby de Broke, who regards the document as very unsatisfactory indeed. He objects to a suggestion that the ratepayers should adapt the roads to the new traffic which has come upon them, and declares that "no amount of good advice from Prince Francis of Teck or Mr. John Burns can ever dispel the very unpleasant fact that any motor-car driven at a speed

over ten miles an hour is bound to inflict severe discomfort to all other users of the road." Lord Willoughby de Broke hardly appreciates the position when he writes in this strain, for it must be recognised that automobile traffic is likely to be of service to the national prosperity, and its benefits are not merely of an individual character.

New Police Methods.

THE police are apparently discarding stop watches in several places, and resorting to other means of estimating the speed of motor-cars. We are informed that on the Great North Road at Retford a few days ago the comparative rate of travelling of a trotting horse and a motor-car was the evidence upon which the police relied, and a Norfolk constable has just informed the local Bench that he had no stop watch, but counted the seconds by the seconds hand of an ordinary watch. Such methods as these are not calculated to inspire

of all these persons. So long as he had anything to do with the court he should always hold that automobiles were bound to give way to everybody else in whatever circumstances. Possibly the best way to deal with the question of motor traffic in the future will be for the authorities to provide Mr. Gainsford with a red flag, and allow him to precede motor-cars on the highway, and so regulate the speed at which such vehicles should travel in country districts.

Endorsement.

A CORRESPONDENT writes with regard to the endorsement of the licences of motorists for any offences. As we show in our Correspondence columns, a licence must be endorsed for any offence—even of the most trivial character—unless it is the first or second summons under Section IX., i.e., relating to exceeding the speed limit.

The Gallien Hill Climb.—The Scene near the Starting Point.

motorists with any greater confidence in the accuracy of police evidence than they have had hitherto.

No Rights on the Road.

THE Spilsby (Lincs.) Petty Sessions has a chairman, Mr. W. D. Gainsford, who is a barrister, and apparently an anti-motorist. Last week, when convicting one who had driven a motor-car in an alleged dangerous fashion, he made what he was pleased to term a few remarks. Firstly, motor-car owners were to remember that they had no common law right to be on the road at all. Surely, however, Mr. Gainsford does not wish us to think that their proper place is on the ordinary pathway now devoted to pedestrians; for, if they are not to travel on the road, where, in the present state of affairs, are they to journey at all. Then he wanted his hearers to remember that foot passengers had the first right, persons on horseback the second, and those who were driving had the third right; the right to motor-cars was only so long as they respected the rights

Dust Trials.

WITH regard to the Dust Trials to be held by the R.A.C. next year, we understand these will take place in the beginning of June on a track half the length of that employed this year, viz., 100 ft. The dust conditions are to be less severe than heretofore, either by mixing coarser grit with the limestone dust or by lessening the thickness of the layer. There will be two classes for amateurs' cars open to all members and associates of the club.

Special Show Numbers of the M.C.J.

REPLYING to several correspondents, the Special Show Issues of the M.C.J. will be those dated November 14th, 21st, and 28th, the three numbers containing a full report of the innovations in design and novelties in accessories, and forming a permanent record of automobile progress.

THE HON. ARTHUR STANLEY'S VIEWS ON THE MOTORING OUTLOOK.

IN view of the opening of Parliament next week and the avalanche of questions regarding motoring men and motoring ways with which the Government is certain to be met by representatives of the Orkneys and other parts of Great Britain, we recently sought an interview with one of the best friends of the automobile in the Houses of Parliament. The Hon. Arthur Stanley, M.V.O., M.P. for a Lancashire county constituency, has seen much diplomatic service, is well regarded at Westminster, and has rendered notable service to the motor movement. The Royal Automobile Club has known few chairmen—Mr. Roger Wallace, K.C., Col. H. C. Holden, the Hon. Arthur Stanley, Mr. C. D. Rose, M.P., and Prince Francis of Teck is the full list—and it does not reflect on the others to say that Mr. Stanley's reign in Piccadilly was marked by an influence on public opinion which proved highly valuable to the industry and sport. His cautious and, we believe, correct attitude when motoring questions have been before Parliament has greatly impressed both motorists and Parliamentarians, and we are pleased to be able to set before our readers his views on the present outlook, as recently stated in the course of a chat at Derby House, St. James' Square, London.

The Hon. Arthur Stanley does not look forward to any immediate legislation, and believes that it will be to the advantage of all concerned to let well alone. In common with those who have followed the Parliamentary position most closely, he does not see any good that could accrue from hasty legislation in a session of Parliament that is wellnigh overloaded with Government measures. More than this, Mr. Stanley regards the existing Act as a very fair one, although, of course, some of the consequences of endorsement of licences for merely technical offences may seem somewhat hard. They, however, could easily be avoided if magistrates universally tempered the administration of the law with common sense.

More important than legislative enactments as to the motor-car itself is the question of the maintenance of the main roads of the country. The taxation levied for that purpose should, in some form or other, go to a Central Department, and be specially allocated by that branch of the State for the development of a really efficient road service. Such is the view of Mr. Stanley with regard to the great main roads; local roads might well be left to the minor authorities, at least for a generation; but there is an immediate necessity for the highways of the country to be brought under one system of control, as is the case with the French roads. The advantages of a centralised Department in this connection are obvious, for by no other means can adequate supervision be ensured.

With regard to the driving of motor-cars, many motorists are doubtless lulled into a belief that they are not exceeding the legal limit, when, as a matter of fact, they may be travelling beyond it. When a man's machine is going well, and the engine is running smoothly, he scarcely realises his pace—a fact which is responsible for many of the conflicts of evidence that have occurred in police courts. Then, too, the raising of dust often gives the public an idea that the car is travelling quicker than it actually is. Thus misconceptions arise which seem difficult to allay. Mr. Stanley's views as to inconsiderate driving were first expressed nearly four years ago, when, at the Easter of 1905, in

his capacity of chairman of the A.C.G.B.I., he addressed a letter to the *M.C.J.*, in which offences of that character were thus set forth:—

- (a) The driving of a motor vehicle in overtaking or passing other vehicles, cyclists, or pedestrians at such an immoderate speed as to cause unnecessary inconvenience or vexation by dust or mud.
- (b) The overtaking and passing of another vehicle when the latter is proceeding cautiously down hill, or is approaching a corner, traffic, &c.
- (c) The passing of another vehicle so as to drive it or others off the road, or cause them unnecessary inconvenience.

The public, we were reminded, should give heed to the improvement that is taking place, not only in the cars that are upon the road, but also in the skill of the drivers. The motor-buses in London afford an illustration of this fact. Vehicles that were allowed on the road two years ago would not be tolerated for a month in these days. In a very little time the skill of the driver and the efficiency of the mechanism will combine in securing a very different state of things in London traffic. What is true of the 'bus is equally so of the car. Only a few years ago it was almost impossible to take a journey along a country road without seeing a motor car *en panne*; now an automobile stranded on the highway is a *rara avis*.

We would emphasize the advisability of motorists seconding the efforts of their organisations in maintaining the credit of the whole movement by consideration to others and by raising the minimum of dust. Often thoughtless drivers passing through a town may prejudice the whole neighbourhood against local motorists innocent of such practices. Hence the importance of the influence that the individual motorist can wield—especially at such a juncture as the present. With regard to the suggestion of a National Road Department, this should receive universal support. Motorists generally feel keenly on the subject, and for the International Road Congress at Paris next week Mr. Ballin Hinde—one of the delegates of the Motor Union—has prepared a paper in which he will advocate such a plan as a matter of primary importance in the development of motor traffic in this country. It is gratifying to us to know that the movement is thus growing, and that its progress in the House of Commons will be closely watched by Mr. Stanley, whose diplomatic service to the motoring community is being recognised—both in and out of Parliament.

The Hon. Arthur Stanley, M.V.O., M.P.

From a

recent snapshot.

THE Emperor of Austria, who took his first ride on a motor-car in company with King Edward a few weeks ago, has now definitely joined the ranks of motorists, he having announced his intention of making use of automobiles during his visits to Vienna and Budapest.

LORD CARRINGTON has promised to attend a conference of the Scottish Chamber of Agriculture at Edinburgh next week. Amongst the resolutions to be discussed is the following relating to motor traffic:—"That steps should be taken without delay to mitigate the inconvenience, discomfort, danger, and loss resulting to the public in general, and agriculturists in particular, in connection with the use of the highways by motorists, and that contributions should be provided from the Imperial Exchequer towards the maintenance of highways, so as to relieve ratepayers in the country districts of part of the increasing burden arising from motor traffic, most of which comes from the towns."

Should the Tourist Trophy Race be Repeated?

THE EFFECT OF THE "FOUR-INCH" RACE—LONG v. SHORT STROKE ENGINES—SUGGESTED
NEW REGULATIONS.

SOME two months ago the leading members of the motor industry expressed their views, through the medium of the columns of the *M.C.J.*, with regard to the R.A.C. 2,000 Mile Trial, the consensus of opinion being distinctly against a repetition of the event in 1909. As for our own opinion, this has frequently been expressed, but it may be briefly repeated. It is that the automobile industry, while it has in the past undoubtedly benefited from the reliability trials and even races that have been held, has now reached a stage when—to put it mildly—the advantage to be gained from such contests is not commensurate with the great amount of time, labour and financial outlay they involve. The fact that several important motor manufacturing concerns held aloof from the much-discussed Four-Inch Race lately held in the Isle of Man, coupled with rumours to the effect that many of those who did compete had decided not to participate in future events, led us to endeavour to ascertain how far the views of the trade coincide with our own—in other words, whether they desire the Tourist Trophy Race to be held in 1909. The questions we set before manufacturers were as follows:—

Do you think the result of the Four-Inch Race will have any effect on the general design of touring cars?

What are your views on the long v. short stroke engine question?

Are you in favour, or otherwise, of the Tourist Trophy Race being repeated in 1909?

Should the race be again held, under what regulations should it, in your opinion, be run—under the old twenty-five miles to the gallon rule, under the cylinder bore restriction, or under new conditions entirely?

Below we print a first instalment of the replies we have received, from which it will be seen that only in two instances is a continuation of the annual race desired. As we hope to publish a further series of letters from makers in our next issue, we defer for the moment any criticism of the various suggestions made with regard to future contests.

A COMPETING FIRM'S OPINION.

Sir John I. Thornycroft, as managing director of the concern bearing his name, "does not think that the result of the Four-Inch Race will have any material effect on the general design of touring cars. The race has undoubtedly caused makers to increase the power obtained from a given size cylinder, but this is not the only feature of importance in touring car engines. We have entered in all the Isle of Man Races so far, and while we have not been fortunate enough to win, our cars have always shown good results. This year both our vehicles which started finished the race, the leader taking fifth place. We think it is of interest to note that these were standard chassis, fitted with rather larger engines. We do not think there will be any advantage to the industry by repeating the race another year, we ourselves having voted against the race this year at the meeting of the Society of Motor Manufacturers and Traders."

THE RACE NO BENEFIT TO THE INDUSTRY.

Mr. T. Blackwood Murray, of the Albion Motor Car Company, Ltd., is another automobile engineer well qualified to express an opinion on the matter, who does not think a repetition of the race next year would be a benefit to the industry. He continues: "We do not think the Tourists' Trophy Race this year will have any appreciable effect upon the design of touring cars. It essentially developed an engine having a long stroke and large valves capable of running at an extremely high speed, and this necessarily inclined towards a

freak and not what is wanted for everyday work. We are of opinion that the stroke of the engine should only be slightly greater than the bore to get the smoothest running engines, which, after all, is really what is desired. Even if the race is again held, we see a very grave difficulty in laying down any limitation which will not have the undesirable effect of developing freak vehicles, which, except that they give some very interesting data to the engineer, are not of much assistance in forwarding the evolution of the ultimate vehicle."

IN FAVOUR OF A "THREE-INCH" RACE.

Mr. T. C. Pullinger, who as head of the Beeston Works of the Humber Company is well known, thinks that "undoubtedly the Four-Inch Race will materially affect the design of touring cars in the future; it certainly will as regards our own." As regards the question of stroke, he remarks, "In all my engine designing I have always taken what I considered a normal stroke, and this has been very satisfactory. What I mean by normal stroke is, the bore multiplied by 1.5. I should very much like to see the Tourist Trophy Race repeated next year but with a smaller engine; I have already suggested three inches as being the maximum. The regulation under which the race should be held, if held at all, are very difficult to discuss in public. There are so many arguments for speed alone, and so many against complicated restrictions, that I think I should favour purely a speed contest with a maximum cylinder capacity and a minimum and maximum weight. I think the weight this year was too light."

AGAINST RELIABILITY TRIALS OR RACES.

Mr. Lisle, of the Star Engineering Company, is emphatically against either a reliability trial or race. He writes: "We are fully of the opinion that a 2,000 Mile Trial is not at all necessary, neither is any reliability trial or race in any form whatever necessary for the motor-car trade of this country, they swallowing up too much time and money. The result of the Four-Inch Race will not, in our opinion, make any very great alteration to the general design of touring cars; in a few cases where firms have been building engines with equal bore and stroke, or a lesser stroke than bore, they may think it advisable to alter. We ourselves have always advocated a longer stroke than bore to the extent of about 25 per cent. and have obtained good results. Should the race be held, we should think under the same regulations as this year would be preferable to twenty-five miles to the gallon of petrol, but to reduce the cylinder bore from 4 in. down to 3½ in."

A SHORTER RACE SUGGESTED.

Mr. E. A. Rosenheim, of the New Arrol-Johnston Car Company, Ltd., is in favour of the race being repeated, and "certainly thinks that the Four-Inch Race will have an effect on the general design of cars, and that this race will kill the big car. It has, moreover, tended to increase piston speeds and improve valve design and various other parts too numerous to mention. We are of opinion that a comparatively short stroke is more desirable for a touring car than a long stroke engine for numerous reasons. The long stroke may possibly be of advantage for racing purposes, but is not desirable for a touring car on account of vibration, &c. If the race is held in 1909, in our opinion not only should the cylinder bore be restricted, but also the length of the stroke—that is to say, a given cylinder capacity should be laid down together with a minimum weight, as we think this would tend to the development of the petrol engine. We are of opinion that this year's race was somewhat too long, and think

that seven or eight laps would amply meet the case in future contests."

HIGH SPEED NOT TO THE INTEREST OF THE MOTOR TRADE.

Mr. Raymond Dennis, of Messrs. Dennis Bros., Ltd., writes that "we are not in favour of holding a 2,000 Mile Trial next year, nor are we in favour of any Tourist Trophy Race, as we think that anything done to encourage high speed is against the general interest of the motor-car trade, and greatly retards its advancement and popularity amongst the general public. We do not think that the Four-Inch Race has any or very little effect on the general design of touring cars, as it is usual with the manufacturers to endeavour to improve their models each year, in the

TOURING IN JAPAN.

Scenes on a Tour Through Japan made on a White Steam Car by Mr. and Mrs. J. R. Wood, of Australia.

hope of being ahead of their competitors, and with a view of placing the best, most suitable, and up-to-date touring car on the market. With regard to our views *re* the long *versus* short stroke engine, we are of opinion that it is not advisable to have too long a stroke, otherwise our own experience has shown us that the engine transmits more vibration to the car."

MR. J. E. VINCENT, in the current issue of the "Cornhill Magazine," writes on "The Moderate Motorist"—a title that almost recalls the day of the motorist of moderate means—and contrives to spread himself agreeably and characteristically over a dozen pages of one of the most literary of present day magazines. He advises motorists to be cautious—as he himself is cautious; and we are interested in his recognition of the conciliatory work of the M.U. Incidentally, he advocates the use of glass wind screens, by which observation can be cultivated without the discomfort of having to face a gale of wind in order to enjoy the scenery.

SOME CURRENT TOPICS.

1909 a Small Car Year.

Evidence is not wanting that the 1909 season will see much greater attention given to the requirements of the motorist of moderate means than ever before. It is too early yet to give definite information as to what British makers are preparing in this connection for the forthcoming show, but the announcement this week of the introduction of a 10-h.p. two-cylinder car by a firm which has for some time been associated with powerful six-cylinder vehicles is a striking indication of the trend of trade. One has not far to seek to find that a similar tendency is making itself evident in France—it is sufficiently demonstrated by the fact that such an old-established concern as the Panhard Company are bringing out an 8-h.p. car, the Brasier Company a 12-h.p., the C.G.V. firm an 8-10-h.p., and Messrs. Renault Freres an 8-h.p.—all fitted with double-cylinder engines. Although the automobile trade since its inauguration a dozen years ago has seen many remarkable changes, the coming year will be just as fruitful in the way of striking developments as its predecessors, and with manufacturers both at home and abroad realising that there is still a large section of the public to be supplied with motor vehicles which shall not only be reasonable in price but economical in their cost of operation and upkeep, a considerable impetus to the motor movement may reasonably be anticipated.

An American View of British Cars.

It is always useful, even if the criticism does not form pleasant reading, to have the views of competitors with regard to the merits or otherwise of British productions. Mr. T. B. Jeffery, of the firm of that name which manufactures the Rambler cars in Kenosha, Wis., U.S.A., who has recently returned home from a three months' combined business and pleasure trip in the United Kingdom and Germany, considers that "some good cars are built abroad, but they do not build them as well as we do to sell for a price within reach of the average man. They are very heavy, little effort being made to reduce the weight, and prices are high." With the object of gaining experience Mr. Jeffery hired cars of various makes when he wished to make local trips on several occasions during his stay on this side of the Atlantic, and describes an incident which occurred during one of his runs in this country which is not without its lesson. While riding in a high-priced and high-powered car he noticed a tin mine a short distance from the main road; a rather rough track ran to the mine, and when he asked to be taken up the slight grade to a point where he could view the operations, the chauffeur told him that the car could not negotiate the climb, because the rocks in the road would tear the lower portion of the car to pieces. Upon investigation he found that the clearance was so small that this danger was really imminent.

The Abuse of the Brakes.

There are many drivers of motor-cars who have not yet realised that when their vehicles are to be brought to a stop it is unnecessarily hard upon the mechanism to drive up with full power to the stopping point and then to apply both brakes suddenly. It is far better to disengage the clutch some little distance before the stopping point is reached, when the car will slow down, but little braking effect being necessary to stop it exactly at the desired point. Only the other day, when passing through Trafalgar Square, I saw a taxi-cab driver put on his brakes so quickly that not only did he skid his back wheels for some little distance, but apparently jerked one of them clear of the road, for the differential gear got to work and turned one of the wheels in the reverse direction. It is not difficult to imagine that if this practice is persisted in there will be plenty of work for the cab company's repairing department. Time was when no particular care was required in handling brakes, because, even when applied to their full capacity, the effect upon the car was not instantly evidenced. On modern cars, however, with powerful metal-to-metal brakes, much more skill must be exercised or the entire transmission gear of the car will be strained beyond its normal capacity, while tyres will be ruined at an astounding rate. *Verb. sap.*

ARCANUM.

GOSSIP FROM PARIS.

THERE is absolutely no doubt about the exports of French automobiles having fallen off in an alarming fashion during the first two thirds of the present year. The official statistics show there was a difference of about £520,000. But the deficit is not, perhaps, so great as might have been expected from the exports in the months of January and February, when the decline was proportionately much larger. "Is there any probability, or even a possibility, that the exports in the last third of 1908 will make up for the deficit in the first eight months?" was a question I put to a competent authority in the matter. The reply was a categorical "No." In explanation he added, "If some foreign countries are not getting ahead of us, there are several that are at least making good, yes, first-class automobiles, and an Englishman, for instance, likes a British car, the same as the Germans and Italians prefer to buy vehicles made in their respective countries. In case of accident they can get them repaired by the makers. We must not complain of that, especially as we have plenty to do at home."

My informant is one of those men who have always regretted the French motor manufacturers in reality neglected their own country's needs to supply the demands of foreign customers. Whether they were wrong in doing so may be questioned; but, in any case, they are right in now seeking to develop automobilism in France to compensate for the decrease in their foreign trade. Have their efforts been successful? So far as my information goes, and it is derived from very good sources, the demand for horseless vehicles for use in France has been greater than most of the manufacturers had dared to hope. At the beginning of the year, and even during the summer, pessimism prevailed. The heavy falling off of the exports was regarded by some people as the signal for the decline of the French automobile industry. Fortunately those fears were greatly exaggerated and the "crisis" does not seem likely to prove so fatal as it was imagined. The all-important question for the manufacturers was whether it was possible to develop the demand at home sufficiently to keep the factories going and to ensure their continued prosperity. Well, that question is already pretty clearly answered in the affirmative. The makers have had to study the wants of the French buyers and to bring down their prices, while the intermediaries have had to content themselves with a very small commission. That being done, the demands for useful cars for every-day work, and not only for pleasure and touring, have surpassed all expectation. It will not be possible to appreciate exactly the extent of this development till the official statistics of the taxation of cars are issued at the beginning of next year, but the increase will most surely be found to be far greater than it was in 1907.

I DO not know whether the "lady" who recently obtained the licence from the Prefect of Police to drive a motor-taxicab is satisfied, but the women who preceded her in obtaining the necessary licence to drive a "moteur à crottin" or horse drawn cab have no reason to complain. The first who succeeded in breaking the tradition that none but men could mount the box was Madame Duffaut, and she has been the first to abdicate her elevated position. The "ladies" who followed her example in adopting the calling of "cochere" are, however, getting more numerous every day. Many of them went to Enghien and other suburban towns, where they have been earning a good living during the summer months, but there are still a dozen or more in Paris. Madame Charnier, who is one of them, declares she was never happier in all her life than she is now; she loves the liberty her calling gives her and is more than satisfied with the money she makes. Even during the dead season, when Paris is called "empty," she earns from 8s. to 10s. a day, and in the season she can count on carrying home every night from 10s. to 12s. Then the "cochers," who used to look askant at her and crack bad jokes at her expense, are now quite gallant, often allowing her to place her cab at the head of the stand long before her turn. She has won their hearts by offering them pinches of snuff and

by accepting a pinch herself out of their traditional "queue-de-rat" boxes.

THE Paris Omnibus Company have been complaining bitterly of the bad solid rubber tyres supplied to them for their motor-buses. Great pieces were torn out of them, it was supposed by the tramway rails. But the mystery was that the tyres wore out quickly only on one route—that of Clichy, Odeon, Montparnasse. No sooner were new tyres put on the wheels than they became dilapidated. The tyre company would not admit that the fault lay with them, and the Omnibus Company threatened legal proceedings. There will be legal proceedings, but not of the description contemplated. By chance an employee of the Omnibus Company noticed a band of boys standing by one of the buses which had stopped to take up passengers at a bureau. While the conductor was occupied in calling out the numbers held by the little crowd of people, one of the lads, armed with a sharp knife, cut a big piece of rubber off one of the tyres. The miscreant was

A Race Meeting at Ostend.

The above illustrations are reproduced from snapshots taken on the occasion of the recent 250 miles race organised by the Ostend Automobile Club. The upper picture depicts the pave over which the cars had to travel for a great part of the course, while the lower one shows the scene on the arrival of Morane on an Imperia car.

Photo by]

[Mr. C. E. Whittaker.

arrested and has confessed that he and a few other boys made a lot of pocket-money by selling the rubber to a dealer, who will also be put on trial for receiving stolen goods.

MARNEY.

IN connection with the Grand Prix race, which is to be held on November 26th next, the Automobile Club of America has chartered the large steamer "City of Savannah" to convey members from New York to the scene of the race. The entire lower deck of the vessel is to be converted into a floating garage, with accommodation for thirty cars.

So rapid has been the progress made with flying machines during the past few months that it does not seem improbable that the various automobile associations will soon find new outlets for their energies, prominent among them being the provision of horizontally-fixed sign-boards, to notify those who make use of the aerial highway as to their whereabouts. A start in this direction has already been made in America, the owner of a large factory at Columbus, Ohio, having, for the benefit of aeronauts, had the name of the town painted in big letters on the roof of the building.

B

THE ELEMENTS OF ELECTRICITY FOR MOTORISTS.

BY H. WAYMOUTH PRANCE, A.I.E.E., A.M.I.A.E.

(Concluded from page 669.)

THE chief points for a motorist to remember in connection with his accumulators are that the cells should be filled with a solution of one part by volume of pure concentrated sulphuric acid to $4\frac{1}{2}$ parts of distilled water, that the plates should always be kept covered with the liquid (water being added to make up for evaporation, dilute acid as above being added to replace any liquid which is spilled), that the accumulator should give a pressure of about 4.5 volts when fully charged, and that the pressure should not be allowed to drop below 3.8 volts, tested directly after the accumulator has been supplying current for some little time and before it has had an opportunity to recuperate. The formation of a white paste upon the plates, known as sulphating, is evidence that the accumulator has been left standing in an uncharged condition, which, perhaps, it is hardly necessary to state, is very deleterious to their action. If sulphating has not been going on long the plates may be cleared by subjecting the accumulator to a prolonged charging, afterwards discharging it

Mr. Gerald Herbert at the wheel of the Singer standard 12-14-h.p. Car which recently attained a speed equal to 59.06 miles per hour on Brooklands Track.

through a four-volt lamp, repeating this several times until the sulphate has disappeared.

Dry batteries are sometimes used in place of accumulators; they have the advantage that there is nothing in them to spill and that they do not need such careful handling, but, on the other hand, they are more expensive. They cannot be re-charged and are of no further use when exhausted. In purchasing a set of dry cells notice should be taken that they are in a fresh condition, and when tested with an ammeter give a current of from 12 to 16 amperes.

The function of the ignition coil is to transform the low pressure current of the accumulator or dry battery into a very high pressure current, thus enabling it to jump the gap at the points of the sparking plug and produce an intensely hot spark which fires the gas in the cylinder. There are two types of ignition coil in use, known as the trembler and the non-trembler, or plain, coil. Briefly, the action of a coil is as follows: the primary current from the accumulator passes through a coil of insulated wire wound upon a core of iron wires. This sets up a magnetic field in the surrounding space. Over the above-mentioned coil of wire is wound another of very fine wire, and in this latter coil is induced, by virtue of the magnetic field, a secondary current of very high pressure whenever the current in the primary coil is interrupted

or started. In the case of the trembler coil this interruption is maintained by means of a thin blade of metal, which, acted upon magnetically by the core of the coil, vibrates, and so alternately makes and breaks the primary circuit many times a second during the completion of the circuit through the contact maker. With the non-trembler coil the high-tension current is induced by the direct interruption of the primary current by means of a "make-and-break" mechanism actuated by the half-speed shaft of the engine.

As mentioned above, the high tension, high pressure, or secondary current, as it is variously named, is at such a pressure that it will overcome the resistance of the air, or, in the case when the engine is working, of the compressed gas, and will jump across the gap between the points of the sparking plug; it will, in fact, pass through anything that is not a very good insulator, so that care must be taken not to touch the bare wire when the coil is in operation, otherwise a severe shock will be experienced; no shock can, however, be obtained from the current passing through the low tension wires.

The question may now be asked, how is electricity generated, and how do we get it in order to charge our accumulators? These questions will be of twofold interest to the motorist, as the principle of the generation of electricity explains the working of the magneto ignition apparatus with which so many cars are now equipped. For the sake of explanation we may take for granted the fact that when a magneto field is cut through by a conductor, such as a wire, forming a closed circuit, a current of electricity is set up in the conductor. This is exactly what happens in a dynamo or in a magneto generator. The latter is merely a specially wound dynamo having permanent magnets instead of electro magnets to produce the magnetic field, this field being cut by the wires wound upon the revolving armature.

There are many various designs of magneto generators in use, a description of which is outside the sphere of this article, but if the above few lines upon the principle of the dynamical generation of electricity be borne in mind, the reader should not have great difficulty in following the details of the various types of magneto to be met with.

Thus we have briefly considered the elements of electricity from a motorist's point of view—facts which the motorist *must* know—and I will close with the reminder to the expert motorist that these notes are not intended to teach him anything which he did not know before, and with the repetition of my observation at the commencement, that "popular and not scientific terms and explanations are employed throughout."

A MOTOR-CAR driver has been sentenced to fourteen days' hard labour at Steyning Petty Sessions for being drunk while in charge of a motor-car. In addition his licence has been suspended, and he has been fined £10 and costs for reckless driving on the same occasion.

THREE meritorious performances made by private owners of Talbot cars in hill-climbing competitions have been brought to our notice. The first is that of Miss E. A. Southam, who, driving her 12-16-h.p. Talbot in the Mid-Staffordshire A.C. hill climb, won the silver challenge cup and gold medal. Secondly, Mr. H. A. Lloyd Jones, driving his 12-16-h.p. Talbot at the Pembrokeshire A.C. hill climb, came out first on formula; whilst, thirdly, Mr. E. Wilson on his 12-16-h.p. Talbot secured first prize in Class 2 of the Sheffield and District A.C. hill climb, with another 12-16-h.p. Talbot second.

THE presence of Prince Francis of Teck at the Four-Inch Race gave the event an official recognition that was much appreciated by the islanders as well as by the motorists. Among other incidental features of interest that may have been observed by H.S.H., who believes that every driver of a motor-car should have a speedometer, was the almost universal fitting of such instruments. The Coventry Humber, Vinot, Westinghouse, Darracq, and Deasy cars were provided with the Smith speedometers, illustrated in a recent issue, one of the S.C.A.T.'s had a Jones, and the Calthorpe and Piccard favoured the O.S. type.

RYE AND WINCHELSEA.

FALLEN are the glories, greatness and grandeur of ancient Rye and Winchelsea, but even in their present loneliness and decay they have a picturesqueness and charm not possessed by many other towns in Sussex. Ages ago their ships rode proudly in the Channel, their navy exceeded that of London, their strategical position gave them importance and significance to the governing powers. Both have been in the wars, and both have suffered from natural forces. Rye and Winchelsea live in their past; their present is confined to a little fishing and a few visitors in search of the picturesque.

Although not possessing architectural treasures of the first importance, and not being able to vie with such counties as Worcestershire in the wealth of its ecclesiastical ruins, Sussex contains many churches and one or two abbeys worthy of note. Along its coast the merry thousands of holiday-seekers play—a popularity much due to its nearness to the great capital. Brighton, Hastings, and the other resorts by the sea on the Sussex shore, are known as modern creations, their houses

a row of lancet windows, with a gallery that, in the olden days, enabled religious processions to pass within its walls. In the transepts are fragments of a Norman arcade, and the special glory of the church consists in the clock, which is probably the oldest public clock in the kingdom still at work. Tradition usually ascribed the presentation of the clock, with its great pendulum, eighteen feet long, still swinging in full view of the congregation, to Queen Elizabeth, but some of the church records, dated 1560–1562, prove conclusively that the town paid for the clock through its churchwardens. Away in the tower are eight bells, dating from 1775, each bearing curious and interesting inscriptions. From the tower a fine view of the surrounding country can be obtained, its height adding to the eminence of the site, and thus assisting the eye to range over the acres of marshland—on one side leading to the sea, which once approached nearer the church, and on the other forming connection with the Sussex Downs. Calm, peaceful and quiet is the scene now presented, with the Rother winding its course between the fields, but imagination can quickly wander along the military road leading to Winchelsea, and conjure up the sights that made

By permission of

Mermaid Street, Rye, with the Oldest House in the town on the right.

[The Homeland Association.]

bearing the unmistakable impress of the last few years, and most of what was ancient and remarkable destroyed to make house-room for the pleasure-seeker. But away in one little corner, easily reached by road from Hastings, is a spot full of memories, and not entirely divested of architectural beauties.

Proudly located on the top of a hill, Rye is a notable feature in the landscape, its red tiled roofs congregated around the conspicuous tower of its ancient church, relieving the scenery from any thought of monotony. That bright speck reminds one of the peaceful little hamlets of Belgium and the Low Countries, where folk cluster around the holy fane and live a life quite apart from the greater world beyond. Whether we approach by car from the land side or see the town from the sea the impression is the same.

The most prominent feature of the town, the cruciform Church of St. Nicholas, naturally claims early attention. Built towards the close of the twelfth century, the incursions of the French played havoc with much of the splendour which led Stowe to describe it as "a church of wonderful beauty." Twice, at least, it was almost destroyed, but, thanks to the pride of the good people of Rye, they invariably replaced what they could of its beauty. On one side of the nave is

these two towns so renowned in the mediæval age. What excitement must have prevailed below this spot when Edward the Confessor granted Rye and Winchelsea to the abbots and monks of Fécamp, and we can imagine the crowd of anxious men who assembled on the site in December, 1067, when William the Conqueror landed at Winchelsea and marched up the high road to Battle. They were exciting days, and may all be recalled from the ancient tower of Rye Church.

A fine relic of Norman days is the Ypres Tower. This is the remains of a castle built in the reign of Stephen by William of Ypres, Earl of Kent, who intended it as a watch tower. Edward III. erected the fine old gate with its portcullis, now known as the Landgate, which, with the church, the Ypres Castle and the old Carmelite Church, are the only buildings now remaining to tell of the days before 1448, when the town was rebuilt, and never again disturbed by the invasion of marauding foreigners.

(To be concluded).

ON Tuesday last Mr. Wilbur Wright established a new record with his aeroplane, he making a flight lasting 1 h. 4 m. 26 sec., with a passenger on board.

CONTINENTAL NOTES.

The Gaillon Hill Climb.

The annual hill-climbing competition over the flying kilometre, organised by the "Auto," was held at Gaillon on Sunday last, the event attracting close upon eighty entries. The record for the climb stands to the credit of Mr. A. Lee Guinness, who in 1906 drove the 200-h.p. eight-cylinder Darracq over the course in 25 sec., and, although some good performances were recorded, this was not beaten. The best time of the day (26 1-5 sec., equal to 86½ miles per hour) was made by Bablot on a Grand Prix Brasier, Alezy on a Clement-Bayard six-cylinder vehicle being second in 26 2-5 sec., and De Brou third on a Mors in 32 2-5 sec. Some good runs were made by the touring cars, which were divided into categories on a cylinder bore basis. A Vauxhall car—the only British vehicle at the meeting—proved the winner in the 86 to 95 mm. four-cylinder class, Mr. P. C. Kidner covering the kilometre in 51 2-5 sec.

A Trial of Light Industrial Motor Vehicles.

Under the auspices of the "Auto" and "Le Poids Lourd," a ten days' trial of light industrial motor vehicles commenced in the Paris district on the 1st inst. and will extend to the 10th. The competition was open for (a) town carriages; (b) four-seated

One of the Petrol Motor Lorries used in the recent Military Manœuvres in Belgium.

motor-cabs; (c) small motor-cabs; (d) motor carrier-cycles; (e) vans up to 4 cwt. capacity; (f) ditto from 4 cwt. to 12 cwt.; and (g) ditto from 12 cwt. to 24 cwt. Relatively little interest has, however, been shown in the event, as only thirteen entries were received, of which only eleven started, these comprising two De Dions (a hotel 'bus and 20 cwt. van) three Unics (a hotel 'bus, a cab and a 20 cwt. van), two Cottereaus (a cab and a van), a Vinot cab, two Clement-Bayards (a cab and a van), and a Demeester 4 cwt. van. The programme consists of six daily runs of about 120 kilometres, a kilometre hill climb, and a 300 metres speed trial. The awards will be made on the formula $\frac{T+C}{P \times D}$ where T is the total running time, C the cost of the fuel consumed, P the useful load carried, and D the distance covered in kilometres.

British Motorists in France.

Among the recent British visitors to France, with their cars, are the Duke of Marlborough (45-h.p. Wolseley), Mr. and Mrs. Jameson (30-h.p. Enfield), Mrs. and Miss Joseph (60-h.p. Daimler), Mr. Thomas H. McKittrick (60-h.p. Clement-Bayard), Prince Duleep Singh (40-h.p. Daimler), Mr. and Mrs. George Duncan (24-h.p. De Dietrich), Mr. and Mrs. Talbot Hassel (75-h.p. Itala), and Mr. Leonard Elger (40-h.p. Mercedes).

Aeronautical News.

On Friday, the 2nd inst., Henry Farman made a flight of forty-four minutes' duration at Chalons, while on Saturday

Wilbur Wright made three flights in his aeroplane, including one with a passenger, which lasted 55 min. 32 1-5 sec., thus establishing another new record.—The Lebaudy steerable balloon, which has been enlarged and reconstructed, made a flight over Paris on Monday at a height of about one thousand feet. The French Government has now three aerial warships in service.—It is announced from Berlin that an engineer, named Milden, has invented a new aeroplane which requires a motor of only from 3 to 4-h.p., and which can be built at an extremely low cost.

An Industrial Vehicle Trial in Italy.

An international competition of motor-omnibuses and other commercial vehicles was held at Piacenza, Italy, from the 18th to the 22nd ult. The competitors were divided into the following categories: (1) Vehicles carrying net loads up to 900 kilos; (2) ditto from 901 to 1,500 kilos; (3) ditto from 1,501 to 2,000 kilos; (4) ditto from 2,001 to 3,000 kilos; (5) ditto over 3,000 kilos; (6) motor-buses to carry from six to ten passengers; (7) ditto over ten passengers; and (8) road trains. The vehicles were subjected to several practical trials of reliability and efficiency on the road, over a distance of about 600 kil. The Piacenza-Bobbio Passo del Penice-Voghera-Piacenza circuit (162 kil.) was covered twice on two different days, once in one direction, and another time in the opposite direction. A further run of about 120 kil. was made over a flat country, also on two different days, while the programme included a test of the fuel and water consumption at maximum speed on a level road. Altogether twenty-four entries were received, these including five Fiats, two Italas, five S.P.A.s, a Fides, a Savoia, a Soller, three Saurers, a Berna, three Gaggenaus, a Yorkshire steam wagon, and a St. Pancras steam lorry. Of these twenty-one went successfully through the whole trials, the awards being as follows:—Class 1, Fiat; Class 2, S.P.A. (1), Itala (2), Fiat (3); Class 4, Gaggenau (1), Saurer (2), Spa (3); Class 5, Saurer (1), Berna (2), Soller (3); Class 6, S.P.A. (1), Gaggenau (2), Fiat (3), Itala (4), Fides (5), S.P.A. (6). Class 7, Saurer (1), S.P.A. (2), Itala (3); Class 8, St. Pancras steam wagon, Gold Medal of the Florence Chamber of Commerce, (2) Yorkshire steam wagon, the Turin Automobile Club's plaque.

The Panhard 1909 Models.

It is announced that for the 1909 season the Panhard Company will manufacture nine models. One of the principal novelties will be an 8-h.p. two-cylinder live axle car; of four-cylinder vehicles, there will be six types of respectively 10, 15, 18, 25, 35, and 50-h.p., the three larger models being chain driven; in addition there will be two six-cylinder vehicles—one of 30-h.p. and one of 65-h.p.

German Motor-car Imports and Exports.

A very quiet state of affairs continues to prevail as regards the imports of motor-cars into Germany. The arrivals of pleasure and industrial motor vehicles and chassis into the country during the eight months ending August last only attained a value of £502,183, as compared with £692,162 in the corresponding eight months of 1907. During the same periods the value of the similar exports from Germany declined from £477,640 to £469,465.

Miscellaneous Items.

It is reported that the sporting committee of the A.C.F. is in favour of fixing 140 mm. as the bore of the cylinders for next year's Grand Prix racing cars.—A new delivery company is reported to be in course of formation in Dresden; only motor vehicles are to be employed by the concern.—Seven motor wagons are being used in the Danish military manœuvres. They include a Halley, an Armstrong-Whitworth, a Fiat and four German vehicles.—A number of motor-vans have just been put in service in Madrid for the transport of meat from the abattoirs to the meat market.—In the recent military manœuvres in France, a special motor refrigerator van was used by the Commissariat Department for the transport of fresh meat.—The annual hill-climbing competition at Chateau Thierry, France, is to be held on the 18th inst.

THE SOCIAL WHIRL.

KING EDWARD, accompanied by Lord Althorp and Lord Redesdale, drove through Braemar on Monday in a motor-car to Mar Lodge, where he spent the afternoon with the Princess Royal and the Duke of Fife, returning through the village before lighting-up time.

ON Sunday motorists took full advantage of the bright sunny weather, and hundreds of motor-cars were seen on all the main roads. I took a run on the Ripley road, and, pulling up at the Talbot at Cobham, counted between thirty and forty cars, whose owners had been similarly attracted to the road by the fine weather. Away on Hindhead quite a motor reunion was in progress. About sixty cars were there at one time, and at the Moorlands Hotel so great was the crush for lunch that numbered tickets had to be distributed to secure seats at the tables in order of arrival. It was also a busy day at The Hut at Wisley, where more than 260 teas were served during the afternoon. Such incidents prove the value of the motorist to the trade of the country, and should demonstrate the folly of the policy of driving owners of cars to other roads and highways.

VISCOUNT GOSCHEN is at present arranging for the erection of special caution signs on the London-Hastings road, near its crossing the road to Rye in the centre of the village of Flimwell. At the suggestion of Mr. R. A. McCall, K.C., the Walmer District Council is applying to the M.U. for five "concealed turning" signs for erection at the approaches to a dangerous cross road formed by the Dover and Granville roads.

I LEARN from Mr. R. J. Meeredy's excellent contemporary that Mr. and Mrs. J. L. Wanklyn entertained Mr. Robert Dillon, Mr. and Miss Moore-Brabazon, Mr. and Mrs. James Little, and Mr. John Neat at Aasleigh House, Leenane, co. Galway, for the visit of the Atlantic Fleet under Admiral Sir Assheton Curzon-Howe, K.C.B. Mr. Wanklyn was M.P. for the Central Division of Bradford from 1895 to 1906, when his recreations were shooting, fishing and golfing. Lately he has added motoring to his other accomplishments, and both Mr. Wanklyn and his wife are keen lovers of the delights of the car.

THE committee of the Lancashire A.C. were fortunate in holding their business meeting the other day at Oaklands, Farington, near Leyland. This is the residence of Mr. J. W. Baxter, the manager of the Leyland Rubber Company, whose hospitality to the motorists of the County Palatine is much appreciated.

ON Thursday of last week a function of interest to motorists took place in the parish of Bleadon, near Weston-super-Mare, when the Bleadon toll gate, on the road from Weston to Bridgewater, was formally removed by the chairman (Mr. Petherham, J.P.) of the Axbridge Rural District Council, and the hitherto private road opened to the public. The gate having been taken off its hinges, Mr. Petherham, with whom was Mr. R. B. Graves Knyfton, J.P. (hon. secretary Somerset A.C.) drove through.

THE Hon. Alexander Kerr and Mrs. Kerr, of Portland, U.S.A., who recently became Lord and Lady of the Manors of Kingshall, Brendall, Mascoties, and Rousehall, after touring through Suffolk in an automobile visiting their estates, have gone on the Continent, where they expect to remain some time.

MR. PHILIP ASHBROOKE, of 8, Argyll Mansions, Chelsea, S.W., writes to a morning contemporary with regard to motor-omnibuses, and adds that he will be "only too glad to offer sleeping (?) accommodation to a representative of the powers that be for one night, so that he might judge what a succession of motors changing gear as they round a corner really means to a tired Londoner trying to obtain rest."

ACCORDING to a statement made at the last meeting of the Steyning West Rural Council, so heavy was the motor traffic, on the occasion of the Goodwood races, between Worthing and Goodwood that it has been estimated that it will cost £2,000 to repair the roads.

LOLLIUS.

HERE AND THERE.

MR. H. PROSSER is about to open a new motor depot at 98 Hope Street, Glasgow.

THE late Rev. Thomas Skarratt, of Kemsing, Kent, left a sum of £200 to his chauffeur.

ALDERMAN DAVIES has been suggesting to the Chester Town Council that they should erect enamelled motor warning signs, as is done in Flintshire.

IN St. Mary's Street, Bridgwater, Messrs. Real, Medland and Wills, Ltd., have a large garage for motor vehicles and have eight cars available for hire.

SEVERAL new designs of "valveless" engines for motor-cars are already in hand, one or more of which are expected to be ready for the forthcoming Olympia show.

A MOTORIST summoned for placing a motor-car on the green-sward on the side of the towing path at Walton-on-Thames, after the vehicle had broken down, has been fined 10s. at the Kingston Police Court.

THE photograph reproduced herewith illustrates one of the most remarkable incidents of the "Four-Inch" race. During the first round, at a spot near Glen Helen, the Darracq racer driven by Mr. A. Rawlinson sustained a side-slip, skidded into the bank, and turned completely over. Not only was the radiator so punctured that Mr. Rawlinson had to plug up a gap

with a large cork, but the impact crippled his front axle so severely that its near-side end was pushed several inches to the rear. The plan view of the car shows a wire stretched from wheel to wheel, to make clear the serious extent of the damage. After this mishap, however, Mr. Rawlinson managed to drive over 325 miles to the finish and secure seventh place.

MESSRS. REID AND EVANS, whose garage in the New North Road at Exeter is well known to our Devonshire readers, have a well-equipped repair department and mechanics qualified to deal with every type of car.

MR. T. S. ADCOCK is now in occupation of the Corn Exchange Motor Garage, East Street, Chichester. He has accommodation for a large number of motor vehicles, and also stocks all requirements for motorists who may be passing that way.

LAST week we reported the death of a mechanic who received injuries while working beneath a motor-car belonging to Scarfoglio. At the inquest the evidence was to the effect that death was due to shock from burns, and the jury returned a verdict of "Accidental death."

FROM the Star Engineering Company, Wolverhampton, comes a copy of the new catalogue of commercial motor vehicles they have just issued. This gives full particulars of the Star 9-h.p., 15-h.p. and 20-h.p. delivery vans and of the 9-h.p. and 15-h.p. cabs to which the firm are now devoting attention.

A LARGE new garage has lately been opened by Messrs. Smith and Milroy, in Wellington Street, St. Mary Cray, Kent.

A MOTION is coming before the Marylebone Borough Council in favour of a maximum speed of twelve miles an hour for motor vehicles within the county area of London.

THE chief constable of Cheshire is criticising the practise of cyclists who neglect to giving audible warning of their approach, and the police are being instructed to take action against delinquents.

ON October 1st, at Brooklands, driving a Dunlop-tyred Mercedes, Mr. Dario Resta attained a speed of 102.496 miles per hour, lowering Mr. Newton's Napier record by .296 miles per hour.

A DOZEN American and foreign motor-cars took part in a 24-hour race on Brighton Beach track, near New York, on Saturday last. A 50-h.p. Simplex car was declared the winner after covering 1,177 miles.

THE "Scarlet Runner," by Mr. and Mrs. Williamson, published by Messrs. Methuen and Co., is proving one of the novels of the season, its motoring interest, as depicted in a recent issue, being particularly strong.

THE Godalming Rural Council has passed a resolution suggesting to the Surrey County Council that they should take steps to secure a special road tax upon motor-cars to meet the increased burden on the ratepayers for road maintenance.

MR. HENRY F. MENCE, Surveyor to the St. Albans Rural District Council, informs us that the steep hill leading from the railway bridge at Radlett towards Shenley is about 330 yards long, the average gradient being 1 in 10 and the steepest 1 in 9½.

A Motor Car's Barrow.

[See page 649 issue of September 26th.]

WHEN the entry list, at single fees, for the Automobile Club of America's Grand Prix race closed last week, it was found to contain the names of twenty-five cars—viz., three Fiat, three Benz, two Mercedes, a Lorraine-Dietrich, a Renault, two Clement-Bayards, and thirteen American vehicles.

TWO mischievous lads at Reigate had a narrow escape on Monday. Finding a motor-car unattended, they took possession of it and started for a ride. They had not gone far when the youthful chauffeur lost control of the car, which dashed into a wall and was considerably damaged. The boys escaped with a few cuts.

THE Executive Committee of the Winnipeg Industrial Exhibition Association has decided to continue for another year the Light Agricultural Motor Competition which was held at the recent exhibition. It is the intention to widen the scope of machines that are able to enter the competition by making more classes.

THE Maison Lemoine, of Paris, has recently devised a new arrangement of front wheel hubs whereby, should the axle arm or other part break, the wheel would not leave the axle-tree. The cap which carries the axle arm is formed with a shoulder against which abuts a ring detachably secured on an extension of the wheel hub.

THE report of the Commissioner of Police of the Metropolis which was issued on Monday relates only to the year 1907, but, in view of the increase in the number of vehicles which took place during that twelve months, it is of considerable interest. Elsewhere we have tabulated the various classes of accidents in which vehicles were concerned.

A COMPANY has just been formed in Strasburg to introduce a service of motor taxi-cabs in that town.

MISS E. K. LAWRENCE, of Homelea, Reigate, is inviting motorists to let her have their discarded fur and leather coats for the use of some of the missionary workers in North-Western Canada.

It is announced from Indianapolis, U.S.A., that one of the Pope Motor Car Company's Pope-Waverley electric victorias recently completed a run of 142 miles on one charge of the battery.

A TEST prosecution instituted by the Hammersmith Borough Council against the London United Electric Tramways Company, as to the latter's obligations for the proper repair of roads in the borough along which the tramway system is worked, is now before the courts.

IN connection with the Electrical Exhibition at Manchester the L. and N.W. Railway Company are issuing cheap tickets for the journey from Euston to Manchester by the midnight trains on Fridays the 16th and 30th and by the 10 a.m. and 4.5 p.m. trains on Saturdays the 17th and 31st.

THE Park Motor Company, of 216, Tottenham Court Road, London, have done good business during the last few days in connection with the hiring of cars, the fine weather of last week again attracting people to the country. The 45-h.p. Mercedes is a conspicuous feature of their hiring business. The firm have several Mercedes, Peugeot and other well-known types of vehicles for sale, and those who propose to enter the ranks of motorists during the present year will find the Park Motor Company well able to advise.

A SPECIAL 40-h.p. petrol demonstration van has recently been completed by Messrs. D. J. Smith and Co., Compton Street, Goswell Road, E.C., to the order of the Emigration Bureau of the Canadian Government. The vehicle is fitted with a special body, the sides having windows behind which specimens of Canadian produce are displayed. The car is at present making a tour of the United Kingdom, it being accompanied by a lecturer, who is employed to make known the advantages of the Dominion to intending settlers.

THE dinner given last week to Mr. Frank Shorland to celebrate his appointment as general manager of Clement-Talbot, Ltd., was a festive occasion which gave his friends an opportunity of testifying not only their regard but also their number. Mr. Albert Eadie was in the chair, Messrs. Harvey Du Cros, Harold Bowden, C. Jarrott, A. W. Gamage, and others being among the 140 present. An illuminated address, together with a service of silver, was presented to Mr. Shorland, who carries with him to his new sphere of operations the goodwill of all who have known him in connection with the cycle industry.

CALLING in at the depot of the London and Paris Exchange Motor Agency, Ltd., in Shaftesbury Avenue, W.C., the other day, we found Mr. Frank Morris, the manager, just back from a business trip to France, where he had purchased from the liquidator of the Orel Company the complete stock of Orel light cars and spare parts. The vehicles, which are well known in France, are of thoroughly sound and reliable manufacture, good hill climbers, economical and easy to run, and of 1908 design and construction, the specification comprising long wheel base, gate change control, gear-driven pumps, push pedals, expanding brakes, artillery wheels, fitted with Dunlop 700 by 85 mm. heavy car section non-slipping tyres, &c. As will be seen from the announcement elsewhere in the present issue, the company have decided to put the cars on the market, whilst the stock lasts, at about half the original price. They consist of two different models, one being fitted with a 7.9-h.p. single-cylinder engine and the other with a 10.12-h.p. double-cylinder motor; as for the complete cars, there are various styles to choose from, including two-seaters, the same with front glass and hood, and also a four-seated vehicle, the rear portion of which is convertible to a light parcels delivery van or luggage carrier. The machines are being supplied complete with lamps and tools ready for the road, and, as they are quite new, are worthy of the attention of prospective motorists of moderate means.

MOTURING ACCESSORIES.

The Bowden Exhaust Cut-Out.

Time was when an exhaust cut-out was regarded as the badge of the scorchers, a position, no doubt, largely due to the sole claim then put forward on its behalf—namely, that it increased the power of the engine, and, consequently, the speed of the car. Of late, however, more justice has been done this fitment, and it is now generally conceded that it has far greater claims for patronage than that of mere speed alone. Perhaps one of the most valuable features of the exhaust cut-out is that it enables an engine test to be taken while travelling, the fact of a cylinder missing being easily discovered if the cut-out is opened for a few seconds. Another good use for the device is that of signalling one's approach when overtaking a noisy car in front, or when nearing a cross road. There are times when the horn is utterly useless, and the value of the cut-out as a warning giver is at such times inestimable. Of course it is important that such an attachment should not be used inadvisably or when likely to cause inconvenience or discomfort to others, and care should be taken that the fitment is absolutely silent when not in use. In this matter of silence special attention has been given in the Bowden exhaust cut-out to make it perfectly gas tight, thus ensuring its absolute noiselessness when not in operation. The accompanying illustration shows the external appearance of the Bowden cut-out, E being an aperture for the ingress of the gases, which discharge through the outlet at B. When not in operation the outlet is hermetically closed by a mushroom-headed valve, the stem of which projects into the extension C. A strong spring encircles the valve stem inside D and holds the valve firmly on its seat. At H is seen emerging the Bowden wire mechanism which operates the valve.

Fig. 1.

When calling recently at the Panhard-Levassor works of Messrs. W. and G. Du Cros, Ltd., in Acton Vale, we had an opportunity of examining the Summer's safety wind screen, illustrated in our issue of the 5th ult. This fitment is so constructed that both the upper and lower sections of the wind shields are adjustable to any desired angle, and their inclination may be altered immediately by either driver or passenger of the car to which the screen is fitted, while travelling at top speed. All that is necessary to the setting of the screen in any position is the manipulation of one fly-nut. The upper section may be given such a "rake" as to obviate the possibility of any reflection or glare, and at the same time neutralises wind-eddies or air-currents so effectively as to render the wearing of goggles quite unnecessary. A single hinge-pin serves for all movements, so that the possibilities of any squeak or rattle are absolutely minimised. The Summers screen is so attached as to impose a minimum strain on the dash. All stresses are taken by stays hinged to the main frame of the car, although stay rods can be bracketed to the dash if desired. This would appear to be a very simple, rigid, and efficient wind shield. We have only to add that its price is gratifyingly reasonable, and that it can be fitted to cars of any size or make, to convince motorists of the advantage of investigating its merits.

An Acton Vale Speciality.

When calling recently at the Panhard-Levassor works of Messrs. W. and G. Du Cros, Ltd., in Acton Vale, we had an opportunity of examining the Summer's safety wind screen, illustrated in our issue of the 5th ult. This fitment is so constructed that both the upper and lower sections of the wind shields are adjustable to any desired angle, and their inclination may be altered immediately by either driver or passenger of the car to which the screen is fitted, while travelling at top speed. All that is necessary to the setting of the screen in any position is the manipulation of one fly-nut. The upper section may be given such a "rake" as to obviate the possibility of any reflection or glare, and at the same time neutralises wind-eddies or air-currents so effectively as to render the wearing of goggles quite unnecessary. A single hinge-pin serves for all movements, so that the possibilities of any squeak or rattle are absolutely minimised. The Summers screen is so attached as to impose a minimum strain on the dash. All stresses are taken by stays hinged to the main frame of the car, although stay rods can be bracketed to the dash if desired. This would appear to be a very simple, rigid, and efficient wind shield. We have only to add that its price is gratifyingly reasonable, and that it can be fitted to cars of any size or make, to convince motorists of the advantage of investigating its merits.

Pocket Voltmeter.

We illustrate in Fig. 2 a new pocket voltmeter placed upon the market by Messrs. Alfred Dunhill, Ltd. It is an extremely practical

Fig. 2.

type, compactly made, and accurate in use. It can be instantly read and is not likely to get out of order.

The Rotax Speed and Mileage Recorder.

Having so recently as in our issue of April 25th illustrated and described the Rotax speed indicator, it now but remains to say that a season's experience by many users of the road has amply justified the

good opinion we then expressed of this very ingenious recorder. It is placed upon the market by the Rotax Motor Company, of 43 and 45, Great Eastern Street, London, E.C., and provides the motorist not only with an opportunity of knowing his speed by means of the dial, but also records the variations of the run from the time of starting to the finish. This is done on a tape, the records being made automatically by a steel point which scores a line on perforated paper, enabling the motorist to see at what speed he was travelling at any particular hour. The device comprises a timepiece, a mileage indicator, a trip recorder, and a speed recorder; and is absolutely positive in its action, every part being gear driven. The Rotax Company have such confidence in their indicator that they guarantee it for twelve months—a guarantee that has not yet been questioned by any who have had the advantage of the device on their cars.

The "Tom Thumb" Tool Wallet.

Messrs. Avery and Roberts, Ltd., of 64, Stanley Street, Liverpool, who make a speciality of the manufacture of motor tools, have had numerous inquiries during the past season for a small motor kit to hold the various tools that are in almost daily use. They have therefore brought out the "Tom Thumb" wallet illustrated in Fig. 3. As will be seen, it is a neat and compact arrangement, the dimensions being 4½ in. by 5 in. The wallet, which is made of hide, contains a dozen British-

Fig. 3.

made tools, viz., a contact file for platinum points, a half-round motor-file, a three square file, a pair of callipers, a steel rule with tapping and spanner sizes, a cotter punch, a milled centre punch, a round-the-corner screwdriver, for getting at screws in awkward positions, a pair of combination motor pliers, a miniature spanner for all small and delicate adjustments, a motor turn-screw, and a split pin extractor. Small tools of this class have a bad habit of not being at hand when wanted—a difficulty that should be overcome by means of the new kit, which has been put on the market at a moderate price.

Leather Reviver.

Many of the cars which, at the beginning of the season, presented a spick and span appearance require a renewal their pristine newness. Outwardly this can be secured by the use of the specialities of Messrs. A. F. Harding and Company, Ltd., of the Stepney Polish Works, London, E. Their leather reviver is prepared for renovating the lining of cars, and is made in all colours, providing motorists with an efficient and economical means for keeping up the good looks of the bodies of their cars. In this connection, too, mention may be made of the firm's varnish reviver for restoring the varnished carriage work. Messrs. A. F. Harding and Company, Ltd., will be glad to hear from motorists interested in keeping their leather work in good condition.

Correspondence.

(Letters to the Editor should be addressed to the offices, 37-38, Charing Cross Road, London, W.C.)

NEW AEROPLANE CLUB.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Owing to your courtesy in having published my last letter in your journal I have received so many letters that I have not yet had sufficient time to answer more than half, and I should be glad if your readers, who have so kindly written and offered their help, &c. (or enclosed subscriptions in advance), will kindly accept this, my explanation and apology, if they have not received an acknowledgment of their letters. Each letter received at this office is being carefully filed and answered in rotation. There is a very large number of applicants, and the club is certain to be formed. As soon as the date is fixed, each member will be notified as to the date, time and place. I am doing everything in my power to make the club a success, and have got some very influential people interested in my scheme, and all I ask for the present is that each member will do his utmost to persuade his friends to join. "Unity is strength," and without the co-operation of other members it is impossible for me to make the club as successful as I should like it to be.

The work which has already been done towards making the club successful is as follows:—Free rooms have been offered at three places in Piccadilly, also in Long Acre; also the Metropole at Brighton have offered a large room on the ground floor for the use of the members,

limit of speed fixed under this Act—(c) if the person convicted holds any licence under this Act, shall cause particulars of the conviction, and of any order of the court made under this section, to be endorsed upon any licence held by him, and shall also cause a copy of those particulars to be sent to the council by whom any licence so endorsed has been granted.]

A HOTEL KEEPER'S COMPLAINT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—A large motor-car with three gentlemen and a lady pulled into my private road at the side of my house, the Crown Hotel, Romford, on the afternoon of the 28th ult., and, after staying over one hour executing repairs, came through the bars to the lavatory at the back of the saloon, and, after using washbasins, walked out and drove off without spending one penny.

This sort of thing from motorists is most frequent. They pull up, fill their engines from private stand-pipes, and drive off, and in other ways make conveniences of licensed houses without asking permission and without even saying "Thank you." I should like to direct public attention to this paltry conduct. I have no other redress, for when

Motor Vehicles for Military Purposes.

In the recent military manoeuvres in Germany a number of motor-buses, as depicted above, were used for the rapid conveyance of soldiers between distant points.

free of cost. I am endeavouring to arrange with firms to supply a suitable eight-cylinder light aeroplane engine to the members of the club at a small hiring fee; the exact dimensions of the engine to be given to any interested member, so that the plane can be built to take the engine without alterations. I am also negotiating to get a large piece of ground suitable for testing the aeroplanes of members, and to build sheds in which they can be kept. If any members know of a suitable piece of ground (it must be some twenty or thirty acres in size, and must be level and hard enough to allow the aeroplanes to get speed sufficient to allow them to rise), will they kindly correspond with me at 22, St. John's Hill, S. W. ?—Yours truly,

W. G. WINDHAM, CAPT.

THE ENDORSEMENT OF LICENCES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had an argument with a legal friend of mine, who said that for any offence by motorists under the 1903 Motor Car Act the magistrates were entitled (on conviction) to endorse the motorist's licence. I said they could only do so for certain offences. I have mislaid the Act, but no doubt you will kindly say who is right. I see your paper every week and take it in. Thanking you in anticipation.—Yours truly,

W. A.

[The endorsement of licences is governed by Section IV. of the Motor Car Act, 1903, the first clause of which is to the following effect:—"Any court before whom a person is convicted of an offence under this Act, or of any offence in connection with the driving of a motor-car, other than a first or second offence, consisting solely of exceeding any

motorists arrive and walk into my house I cannot order them out, not knowing but they may require refreshment.—Yours truly,

ARTHUR POND.

HILLS AND THEIR GRADIENTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last issue I miss two hills which I have ascended, namely the Peak Hill, on the Sidmouth and Exmouth road via Otterton. This hill is a mile long, and, according to the contour book, has an average of one in seven, which I have every reason to believe correct.

The other hill is on the main road from Whitby to Malton, viz, the Blue Bank, about four miles long, from Sleights Station. The contour book gives the average as one in ten, but many parts are quite one in four.—Yours truly,

T. N. MULLER.

EXCESSIVE FUEL CONSUMPTION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if you will kindly let me know through the *M.C.J.* the reason why an old 9-h.p. Daimler (1904) car uses one gallon of petrol to ten miles. The petrol is pressure fed, the gauge registering 6 lb. Do you think there is too much pressure on the petrol?—Yours truly,

WALES.

[A 9-h.p. Daimler of the date mentioned should do about 50 per cent. better than ten miles on a gallon if it has pneumatic tyres and is in good order. Six pounds pressure is certainly too much unless the level of the

petrol in the float chamber has been tampered with, and in any case it is likely to lead to excessive consumption. Four pounds pressure on the petrol is ample, and we advise the regulating valve to be so set as to prevent any more being registered.

If the engine is in apple-pie order as regards compression and valve timing, &c., there may be a loss of power somewhere in the transmission that would help to account for too much fuel being needed for a given mileage—worn chains, for instance, or perhaps one or both of them may be too tight.]

THE DISADVANTAGE OF DUSTLESS ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With dustless roads a new danger has arisen. This is found in the pedestrian who forsakes the rough and pebble-covered footpath for the "new" motor road, and I for one do not blame him, especially in hot weather, when crunching along on dust and shingle must be most trying. In cases, as is often found, where only the crown of the road has been tarred, the danger is increased, as he does not like to take to the dusty gutters to make room for his enemy. In some cases only two strips, each about a foot wide, and representing the wheel tracks, are tarred, and the other night, on such a road, I narrowly missed a family of tramps, who, on coming round a corner, I found marching in two single files, each on a tarred strip. I feel that surveyors should let this matter have their attention.—Yours truly,

A. DUCKHAM.

WARNING TO MOTORISTS IN DEVON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motorists approaching Totnes by the Newton and Torquay roads would be wise to drive well within the limit on the more open parts of these roads. Great care is necessary in passing through the tortuous and narrow street of the town, as it is used as a playground for the more youthful inhabitants, and a resting-place for all sorts and conditions of wheel traffic—mostly unattended.

They would do well to note also that local drivers of horse drawn vehicles move according to their own fancy, without any reference to the regulations of the Highway Act. The fact that the police force of the borough is engaged elsewhere makes no difference whatever.—Yours truly,

TRAVELLER.

A MAGNETO TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have lately been having much trouble with my Gianoli magneto. I can only at times get a spark at No. 4 at the distributor. The magneto has been down, a new screw and trembler fitted, also new carbon brushes and screw at distributor. I can get a good spark on 1, 2, and 3, but when I switch over to the accumulators I can get a good spark at No. 4 as well. I should feel obliged if you or any of your readers could assist me in this matter.—Yours truly,

S. M. T.

[It is somewhat difficult to suggest what is the cause of the trouble from the above description, as the spark only misses on No. 4 of distributor when magneto is in action. It is possibly due to the four-cornered cam underneath the high tension collector of the distributor, one of the corners of which may have worn sufficiently not to spark with the magneto and yet do so with the battery. for one of the features of the Gianoli system is the automatic voltage controller, which prevents a current beyond a certain strength being used, no matter how fast the machine may be driven. It might prove on careful testing that the distributor is not firing accurately on any of the four points, caused by improper adjustment of the automatic make and break at the end of the armature.]

THE FUNCTION OF THE TORQUE ROD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you would give me an explanation of the object of what is known in live axle cars as the torque rod. Frequently I see a reference to this part of a motor vehicle, but, being a new recruit to the ranks of motoring, I am ignorant of its function. The information would, I am sure, also be useful to other readers of the *M.C.J.* besides.—Yours truly,

S. R. A.

[The object of a torque rod applied to a rear live axle is to stay it from the strains of driving as follows:—When the propeller shaft turns the small driving bevel pinion and the car is in forward gear there is a tendency for the axle casing to rotate upwards in front, caused by the reaction of the small pinion trying to climb up the large driven bevel. When the reverse gear is in operation the axle casing tends to dip downwards in front. In both cases the torque rod prevents this happening and keeps the axle casing continually presented in suitable alignment with the cardan transmission or universally jointed propeller shaft. The torque rod should be so fixed as to allow for lateral and rocking motion of the axle, and also, in the case of rear springs being fixed without shackles at one end, to permit of longitudinal movement. When the rear springs are shackled at either end two radius rods are employed in

addition to a torqueroed, but the duty of radius rods is merely to keep the axle from longitudinal movement and to transmit the drive to the frame.]

BROKEN CYLINDER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you or some reader of the *M.C.J.* could inform me the probable cause of my cylinders breaking. I have had two cylinder heads broken within twelve months; the car is a 6-h.p. single-cylinder of French construction; in both cases they broke just above the flange that bolts them on to the crank chamber; the fractures were irregular. I may add that the four bolts that hold the heads to crank chamber were screwed tight down. Would a back fire do this mischief?—Yours truly,

R. C. A.

[The only probable cause of this trouble we can suggest is that the top of the crank case has by some means become out of truth, and does not present a flat face for the cylinder to bolt down on. This, in combination with the explosions and the bolts being tight, would in all probability cause the trouble. A back fire would not in any way do this.]

CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the answer to "Doncaster" in your issue of the 19th ult. re charging a fifteen ampere-hour accumulator, might I suggest that the plan recommended would be very uneconomical, as, except the other nine lamps were removed while the charging was in progress, a lot of light would be wasted, unless the charging was done during lighting hours, which is not always convenient. I am presuming that "Doncaster" has a storage battery in connection with his

PORTABLE CHARGING BOARD TO CONNECT UP TO WALL SOCKET.

lighting plant; but, even if he has not, I think the accompanying sketch will show an easier and more economical way of charging the battery from one of the wall sockets than from one of the lamps.—Yours truly,

INVERNESS.

ABOUT BRAKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the owner and driver of a 15-h.p. Coventry Humber. The hand brake, consisting of ordinary strap, leather lined, on back wheels, is not nearly so effective as it ought to be. I should be very glad if some of your readers could suggest some means of improving this. To produce anything like a stopping force, it requires a pull on the lever which it is evident the gear was never designed to take.—Yours truly,

CAUTIOUS.

[We would recommend "Cautious" to have his brakes re-lined. The special lining known as Frood's "Ferodo," which is obtainable from Messrs. G. T. Riches and Co., Store Street, W.C., or any motor-car agent, will be found well adapted for the purpose.]

A CORRESPONDENT writes asking for the names of the manufacturers or the agents in this country for the "Lusen" coil.

THE O.T.A.V. VOITURETTE.—"Welland" writes asking owners of O.T.A.V. 5½-h.p. two-seated cars to give their experience of the same.

THE 20-H.P. ROVER.—"E.F.D." writes asking whether those readers of the *M.C.J.* owning Rover 20-h.p. cars would give their opinion and experience of these vehicles.

SEVERAL correspondents have written drawing our attention to the shocking condition of the roadway in Portland Place, W. The road is so full of holes that passengers, not merely in motor-cars, but also in horse-drawn vehicles, are subjected to severe jolting.

REPLYING TO "B. D." the Fors carriage lighting battery is supplied by Messrs. Richard Pape, Ltd., of the Albion House, New Oxford Street, London, W.C., who are also supplying ignition batteries on the same principle for use on motor-cars. These were recently favourably reported upon in our columns.

RACING AT BROOKLANDS.

ALTHOUGH beautiful weather prevailed for the final meeting of the year at Brooklands on Saturday last the attendance of the public was very meagre. The races were, however, carried through very successfully, a feature of the various events being the preponderance of amateur drivers as compared with the trade or professional element that has been hitherto noticeable. The first item on the programme was the Large October Sweepstakes for cars of between 35-h.p. and 59-h.p. R.A.C. rating, over a distance of about 7½ miles. There were only three entrants—W. Jochems, a prominent member of the Dutch Automobile Club and a regular competitor at the Ostend Automobile Meeting, on a 48-6-h.p. Mercedes; O. S. Thompson with his familiar 36-1-h.p. Austin "Pobble," and H. G. Nalder with his 35-7-h.p. Berliet "Grayling." The result was a victory for Jochems, he winning by about a hundred yards at a speed of 67½ miles per hour, Nalder being second and Thompson third.

Seven drivers turned out in the first heat of the Fifth All-comers Handicap (about 5½ miles), the vehicles ranging from the 59-6-h.p. Mercedes driven by D. Resta (scratch), to a new 5-h.p. car known as the "Varsity," lately put on the market by Messrs. R. Lascelles and Co., and which had 5 min. 28 sec. start. Resta pulled up splendidly, but only succeeded in getting home second, the first place falling to H. P. Martin's 38-1-h.p. M.A.B. A. E. Robson, 27-9-h.p. Nagant-Hobson, and the Hon L. Bruce, 48-6-h.p. De Dietrich, also qualified for the final. The new 27-9-h.p. Imperia car, which is being introduced into this country by Mr. C. E. Whittaker, made its debut in the second heat, in which there were nine competitors. An expert driver from the works had been brought over to drive the Imperia, but, owing to his not being registered with the R.A.C., he was not allowed to take the wheel, Mr. Graham White taking his place at a few minutes' notice. He having had no experience whatever of the car, it was hardly to be expected that it would

Racing at Brooklands.—The Imperia Car, which made its first appearance on the track on Saturday.

take the leading place. The reason that it only finished sixth was, however, not due to any want of ability on the part of the driver, but to the fact that, as was subsequently discovered, only three cylinders were running, the ignition wire on the fourth having become detached. The speedy qualities of Jochems' Mercedes were again evidenced, this car finishing first about 100 yards in front of O. S. Thompson's Austin, R. Fedden's 18-8-h.p. Straker-Squire being third and L. Artrex's 25-6-h.p. Beeston-Humber fourth. Eight cars, the first four in each heat, turned out for the final, the winner of the sweepstakes being Jochems (48-6-h.p. Mercedes), 1 min. 32 sec. start, who covered the 5½ miles at an average speed of 70 miles an hour. R. Fedden (18-8-h.p. Straker-Squire), 2 min. 32 sec., was second; O. S. Thompson (36-1-h.p. Austin), 1 min. 30 sec., third; L. Artrex (25-6-h.p. Beeston-Humber), 1 min. 56 sec., fourth. Resta, who was on the scratch mark, was unable to catch up the others, he finishing sixth.

Considerable interest was shown in the 5½ mile Motor-cycle Handicap, in which there were no less than twenty-six competitors, including most of the leading riders of the country. There were four men on the scratch mark, while the handicap allowance ranged up to 2 min. 50 sec. An excellent race ensued, though G. Gibson and R. O. Clark soon established a lead and were never overtaken, notwithstanding that the back-markers made great efforts to overtake the field. The result was—G. Gibson, 3½-h.p. Triumph, 2 min. 20 sec. start, first; R. O. Clark, 5-h.p. F.N., 2 min. 20 sec., second; and H. Shanks, 2½-h.p. Chater-Lea, 2 min., third. The winner's speed averaged 53 miles per hour.

The final event of the day was the Autumn Handicap, for cars entered and driven by private members of the B.A.R.C. Five vehicles faced the starter, these being Clement Hobson's 48-6-h.p. Brasier, scratch, O. S. Thompson's Austin, 26 sec., C. A. Bird's 34-5-h.p. Mercedes, 40 sec., A. van Hoboken's 35-7-h.p. Mercedes, 1 min. 13 sec., and Ralph

Creyke's 8-9-h.p. Sizaire, 2 min. 34 sec. A. van Hoboken was the first to complete the 5½ miles, he winning by about 200 yards at an average speed of 49 miles per hour. C. A. Bird was second and O. S. Thompson third.

VEHICLES AND ACCIDENTS IN LONDON.

FROM the report of the Chief Commissioner of Police for 1907 issued on Monday we learn that during that year 16,475 licences were issued by Scotland Yard for public carriages. Compared with 1906, they were as follows:—

| | 1907. | 1906. |
|--------------------------|-------|-------|
| Hansom cabs ... | 5,952 | 6,650 |
| Four-wheeled cabs ... | 3,866 | 3,844 |
| Motor-cabs ... | 723 | 96 |
| Horse-drawn 'buses ... | 2,557 | 2,964 |
| Motor-'buses ... | 1,205 | 783 |
| Horse-drawn tramcars ... | 404 | 905 |
| Mechanical tramcars ... | 1,768 | 1,396 |

The rapid growth in the number of motor vehicles immensely increased the work of inspection. During the year 8,508 reports were made against motor-'buses declaring them to be unfit, the principal defects being the following: Unduly noisy, 4,862; defective steering gear, 362; defective brakes, 936; oil or grease overflow, 2,105.

With regard to accidents in the streets the number in which persons were killed was as follows:—

| 1907. | 1906. | 1905. |
|-------|-------|-------|
| 273 | 212 | 172 |

The casualties for 1907 are thus classified:—

| | |
|-------------------------------------|----|
| Motor-omnibuses ... | 35 |
| Mechanical tramcars ... | 22 |
| Motor-cab ... | 1 |
| Uncovered motor-cars ... | 41 |
| Covered motor-cars ... | 21 |
| Motor-cycles ... | 4 |
| Horse-drawn cabs ... | 8 |
| Horse-'buses ... | 14 |
| Uncovered carts drawn by horses ... | 88 |
| Covered carts drawn by horses ... | 33 |
| Private carriages ... | 2 |

So far as accidents in which persons were injured in the streets were concerned these were as follows:—

| 1907. | 1906. | 1905. |
|--------|--------|--------|
| 16,772 | 14,060 | 11,688 |

the analysis for last year being as follows:—

| | |
|--------------------------------------|-------|
| Mechanical tramcars ... | 2,119 |
| Motor-'buses ... | 1,108 |
| Uncovered motor vehicles ... | 1,075 |
| Covered motor vehicles ... | 483 |
| Motor-cycles ... | 274 |
| Horsed cabs ... | 1,136 |
| Horsed tramcars ... | 212 |
| Horsed 'buses ... | 460 |
| Uncovered vans drawn by horses ... | 2,822 |
| Covered vehicles drawn by horses ... | 1,465 |
| Broughams ... | 532 |
| Led horses ... | 76 |
| Ridden horses ... | 110 |

AUTOMOBILE INSTRUCTION.

THE Borough Polytechnic Institute, at 103, Borough Road, London, S.E., is commencing its petrol motor classes in association with the Engineering Trades Department, of which Mr. C. T. Millis, M.I.M.E., is the head as well as being the Principal of the Institute. One course is intended for those who are connected with the industry as drivers, repairers, &c., and arrangements will be made for students to receive demonstrations upon and inspect a typical car. The second course is arranged for motor engineers, draftsmen, and designers, and it is intended to carry out the complete calculations and design of a modern high power touring car chassis, with reference to engines and running gear. Messrs. G. Draycott, A. Marsden and W. Hill are the responsible teachers, and those of our readers in South London desirous of adding to their knowledge of automobile matters will be interested in the syllabus, which can be had on application at the Institute.

MESSRS. J. B. FERGUSON, LTD., have established a class in motor-car construction at their establishment in Chichester Street, Belfast. A 14-16-h.p. Argyll chassis is being used for the purpose of instruction, and evening lectures as well as daytime workshop instruction are being given.

THE London agency for the B.S.A. cars is in the hands of the Hyde Park Garage, 1A, Lancaster Gate, W., and the Belle Isle Co., Ltd., York Road, N.

THE Aster Engineering Company, Ltd., are removing the whole of their business from 4, Princes Street, Hanover Square, London, W., to new offices, situated at their works, Wembley, Middlesex.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE following gentlemen have been appointed as delegates of the R.A.C. at the Road Congress which opens at Paris on the 11th inst.:—The Hon. Arthur Stanley, M.V.O., M.P., Lord Montagu of Beaulieu, Mr. W. Worby Beaumont, the Hon. C. S. Rolls, Lieut.-Col. R. E. B. Crompton, C.B., and Mr. Vere Ker-Seymer.

His Excellency the Marquis di San Giuliano, Italian Ambassador, has been elected an honorary member of the club during his residence in Great Britain.

One hundred names were added to the membership roll of the Club on Wednesday of last week. Among those elected were Sir Charles T. Dyke Acland, Bt., Lord Curzon, Sir William Eden, Bt., the Hon. F. Hamilton-Russell, D.L., J.P., Sir Hubert E. H. Jerningham, K.C.M.G., the Hon. Gilbert Johnstone, the Hon. H. Lygon, Count Alexander zu Munster, Brigadier-General Sir Henry Rawlinson, C.B., C.V.O., Bt., Sir Clifton Robinson, and the Hon. A. Dudley Ryder.

The following gentlemen have been appointed by the R.A.C. to be its representatives at the International Conference of Recognised Automobile Clubs, which is to be held on the 19th inst. at Paris:—Col. H. C. L. Holden, R.A., F.R.S., Capt. F. E. Dyke Acland, and Mr. Mervyn O'Gorman.

The Committee of the R.A.C. has reported that the garage of the Motor Supply Company, Ltd., in Brick Street, London, W., will prove a convenience to Associates of that organisation.

THE MOTOR UNION.

ON the 30th ult. the total number of individual members of the M.U. stood at 5,843, as against 4,437 on the same date last year, an increase of 1,406, or nearly thirty-two per cent.

It is proposed to hold the annual dinner of the Union on the 18th prox., at the Great Central Hotel, London.

AUTOMOBILE ASSOCIATION.

THE A.A. is offering a reward of £10 for information leading to the conviction of a man who, on Sunday afternoon, threw a piece of stick at a passing motorist near the Royal Huts Hotel, at Hindhead, seriously injuring a lady in a car.

MANCHESTER AND DISTRICT MOTOR TRADES ASSOCIATION, LIMITED.

AN open meeting of the manufacturers and traders of Manchester and district was held at the Albion Hotel, Manchester, on the 29th ult., to consider the pressure brought by various bond-signers who, by reason of having signed the bond of the S.M.M. and T., Ltd., are thus debarred from exhibiting at the forthcoming show at Belle Vue. In the unavoidable absence of Mr. C. Davies, the president of the association, Mr. F. Bullock, vice-president, took the chair. All present were, in turn, invited to express their opinions on the matter, and it was ultimately moved, seconded and carried *nem. con.*, that the society be approached for them to permit their bond-signers to exhibit at the Manchester Motor Car Show, to be held at Belle Vue, February 19th-27th next, and that a deputation be elected to wait upon the S.M.M. and T., Ltd., in London, with a view of securing the said sanction.

SHEFFIELD.

THE results of the hill-climbing competition on the 19th ult. work out as follow, on the R.A.C. formula:—

CLASS 1.

| No. | Name. | Car. | Order of Merit. |
|-----|---------------------|-----------------|-----------------|
| 1 | Mr. L. Slater | 8-h.p. Jackson | 779 |
| 2 | Mr. W. Watts | 8-h.p. De Dion | 560 |
| 3 | Mr. A. W. Blackwell | 8-h.p. Rover | 519 |
| 4 | Mr. H. Beesley | 6-h.p. Wolseley | 470 |

CLASS 2.

| | | | |
|---|-------------------|---------------------------|-----|
| 1 | Mr. E. Wilson | 12-16-h.p. Clement-Talbot | 740 |
| 2 | Mr. G. D. Flather | 12-16-h.p. Clement-Talbot | 702 |
| 3 | Mr. H. D. Orr | 16-20-h.p. Sunbeam | 592 |
| 4 | Mr. H. Warriner | 10-h.p. Allday | 481 |
| 5 | Mr. H. Beesley | 6-h.p. Wolseley | 406 |

CLASS 3.

| | | | |
|---|--------------------|---------------------------|-----|
| 1 | Mr. A. Farnell | 30-h.p. Daimler | 809 |
| 2 | Mr. E. Wilson | 12-16-h.p. Clement-Talbot | 745 |
| 3 | Mr. G. D. Flather | 12-16-h.p. Clement-Talbot | 728 |
| 4 | Mr. F. W. Huband | 14-h.p. Allday | 618 |
| 5 | Mr. H. Burgon | 15-20-h.p. Clement-Talbot | 603 |
| 6 | Mr. B. Shaw | 20-h.p. Rover | 526 |
| 7 | Mr. J. Barber | 20-h.p. Belsize | 497 |
| 8 | Mr. H. Warriner | 10-h.p. Allday | 483 |
| 9 | Mr. J. H. Pickford | 20-h.p. Rover | 430 |

In Class 1, Mr. Slater takes the Single Cylinder Challenge Cup, presented by Mr. Harvey Foster, and the club medal. In Class 2, Mr.

E. Wilson takes the first prize, given by Mr. E. F. Coupe. Mr. G. D. Flather the second prize, given by Mr. Albert Davidson; and Mr. Orr the third, given by Mr. Ben. Hind. In Class 3, Mr. Farnell takes the Challenge Cup presented by Mr. Harvey Foster, and the club medal.

The committee have taken up several cases where complaints had been made of inconsiderate driving, with beneficial results; and to facilitate such cases being dealt with have appointed an Inconsiderate Driving Committee, consisting of Messrs. P. J. Benson, G. D. Flather, and E. W. Hatfield, with power to deal with such cases as they arise.

SOCIETY OF ENGINEERS.

MR. H. CONRADI read a paper on "The History of Mechanical Traction on Tramways and Roads" before this Society on Monday, in the course of which he mentioned that the origin of the tramways, about 200 years ago, consisted in the laying of straight and parallel pieces of timber from the colliery to the river, for the conveyance of coal. The idea of mechanical traction on common roads was, however, not abandoned, and after a first trial in 1769, energetically revived between the years of 1803 to 1836, and periodically continued till about 1872. This revived tramway traction; first by horse and then by mechanical power. The author mentioned that in competition with tramway traction, on account of the permanent way construction, along the ordinary roads, mechanical traction on common roads was again thought of, seeming to be preferable, requiring no rails along the roads. It made rapid development, as now seen in the production of petrol, steam, and electric motor omnibuses and private carriages.

In the illustrations given above the right hand picture depicts the Daimler Cricket Club (this year's champions of the Coventry and District Cricket League, Division II.). The left hand picture shows a 48-h.p. Daimler Car with Mr. E. M. C. Instone (President of the Club) at the wheel, and seated beside him, holding the cup, is Mr. T. E. Shadbolt, the President and Founder of the Coventry and District League. The 50-Guinea League Challenge Cup won by the Daimler Club during the past summer will be easily identified at the top of the picture.

Photos by)

(Messrs. Jackson and Sons.)

SOCIETY OF MOTOR MANUFACTURERS AND TRADERS.

THE Tyre and Accessories Committee recently met with Mr. A. Brampton in the chair, when proposals in connection with standard ratings for accumulators were considered. It was resolved to circulate copies amongst members interested for comment and to hold another meeting on Monday, October 12th, to consider the matter further in the light of replies to the circular.

Further correspondence on the subject of rim standardisation was reported, and it was resolved to let the whole matter lie on the table.

MANCHESTER MOTOR.

ON Saturday a fuel consumption test was carried out by the Manchester Motor Club over a course of about twenty-five miles, chiefly in Cheshire. The two best results were as follows:—1, E. J. Chambers, 16-h.p. Bell, 43 car-miles and 60 ton-miles; 2, E. J. New, 18-h.p. Siddley, 28.9 car-miles and 63.6 ton-miles. Other competitors included: P. A. G. Bell, 20-h.p. Bell; J. T. Ward, 8-h.p. Rover; and H. Brady, 8-h.p. De Dion.

NORTH YORKSHIRE.

MR. H. A. WATSON presided at the meeting of the committee of the North Yorkshire A.C. last week, when, on the motion of Lord Der-

more, it was resolved to draw the attention of the Rural District Council to the state of the roads from Scarborough to Robin Hood Bay.

The secretaries also reported that in consequence of their recent communication to the local Education Committee the attention of children in the schools had been called to the reprehensible practice of throwing stones at motorists.

NOTTINGHAMSHIRE.

THOSE who have followed the course of automobile progress in Nottinghamshire will regret to learn of the death of Mr. G. H. Kirk, who was practically the founder of the county automobile club, he having convened the first meeting.

VICTORIA.

OWING to the large increase in work of the Automobile Club of Victoria, six sub-committees have been appointed to assist the general committee.

A hundred white enamelled motor danger signs have just been landed by the club, which will be given free to the councils that will erect the same.

On the 9th prox. the club will hold a hill-climb and picnic, and a tourist car trial from Melbourne to Sydney, via the south coast of New South Wales, is under consideration.

During the past three months 150 new members have been elected, making a total of 346 out of the 700 motorists in the State.

The Victorian Section of the Australian Volunteer Automobile Corps has been formed, with Capt. H. Tarrant as commanding officer.

MR. A. DUCKHAM has been invited by the Derby and District A.C. to lecture to the members on "Oils and their uses."

Touring in Holland.—The Hoogesliuis, Amsterdam.

As announced last week, the Aero Club Institute has been formed under the auspices of the Aero Club. Application for membership should be made to the secretary, Aero Club, 166, Piccadilly, London, W.

AMONGST the latest members elected at the Motor Club are H. H. Prince Jitendra Narayan of Cooch Behar, as a town member, Lieutenant Rasch, secretary of the German Motor Yacht Club, and Mr. H. M. Bauer, chief engineer of the same club, as honorary members.

COMPANY NEWS.

MESSRS. J. KEELE (LTD.) has been registered as a limited liability company with a capital of £10,000 in £1 shares. Offices, 72, New Bond Street, W.

THE London and Westminster Motor-Cab Company, Ltd., has been registered with a capital of £1,000, and offices at Madeira Hill, Streatham.

THE Peterborough City Garage Company, Ltd., has been registered with offices at 31, Cowgate, Peterborough, and a capital of £2,000 in £1 shares.

HAVING met with such striking success with their llo lubricants in the south of England, Messrs. Easton and Melville, Ltd., are now commencing a campaign in the north. Mr. Richard Starley is acting as their representative in Coventry, while Mr. Edgar E. Trevor is looking after their interests in Glasgow. The company, whose address is 85, Shaftesbury Avenue, W., are prepared to appoint other agents in the principal northern towns where they are not already represented.

COMMERCIAL MOTOR VEHICLE PARADES.

LONDON.

FORTY-NINE commercial motor-cars took part in the parade of the Commercial Motor Users' Association on the Thames Embankment, London, on Saturday. Of these, however, only thirty-four were formally entered for the competition, and they alone were considered in the judging. Each of the drivers had beforehand undergone a verbal examination, and the object of Saturday's parade was to enable the judges to examine the condition of the machines, and to make their final adjudication as follows:—

First prize (£5) for steam cars: Westminster City Council's Thornycroft.

First prize (£5) for petrol cars: General Post Office's Maudslay.

Second prizes (£2 each): Seabrooke and Sons' Foden; South Metropolitan Gas Company's Milnes-Daimler; the Westminster City Council's Thornycroft and Leyland.

Third prizes (£1 each): Allen and Hanbury's Yorkshire and Thornycroft; General Post Office's Wallis and Stevens' tractor; Mann, Crossman and Paulin's Leyland; J. M. Patrick's Straker; E. W. Rudd and Co.'s Coulthard; South Metropolitan Gas Company's Simms and Milnes-Daimler; Wall Paper Manufacturers' Thornycroft. An extra prize of £1 was given for Hamilton and Co.'s Clarkson van.

The competition is organised annually to encourage drivers to take a personal interest in the driving and condition of their cars, and the prizes are awarded to them.

GLASGOW.

On Monday the parade of commercial motor vehicles organised by the Commercial Vehicle Department of the Scottish A.C. took place. Sixty entries had been received, the vehicles including the following makes—Adams, Halley, Albion, Milnes-Daimler, Argyll, Mass, Humber, St. Vincent, Daimler, Dennis, Arrol-Johnston, Sunbeam, Belhaven, Darracq-Serpollet, Foden, Stewart-Thornycroft, and Alley and MacLellan. The vehicles were drawn up in Blythswood Square early in the afternoon and then paraded by way of Sauchiehall Street, West George Street, Buchanan Street, Albert Bridge, Eglinton Street, Jamaica Street, Broomielaw, Bothwell Street, back again to the square.

First prizes were awarded to the drivers of Messrs. R. D. Waddell's Milnes-Daimler; Mr. A. Kennedy's Arrol-Johnston lorry; the United Co-operative Baking Society's Albion lorry and the Scottish Co-operative Wholesale Society's Alley and MacLellan steam lorry.

Second prizes were won by the drivers of Messrs. Stewart and McDonald's Albion van; Messrs. Arthur and Co.'s Albion van; the United Co-operative Baking Society's Halley lorry, and Messrs. G. and J. Weir's Darracq-Serpollet steam lorry.

Third prizes were obtained by the drivers of Messrs. Cooper and Co.'s Albion van, and Mr. J. Gibson's Halley wagonette.

ROAD REPORTS.

SHEPPERTON.—Mr. F. J. Willis, an inspector of the L.G.B., at Shepperton Schools, on Saturday, inquired into an application by the Middlesex County Council to limit the speed of motor-cars under the Motor Car Act, 1908, to ten miles per hour on a stretch of road three-quarters of a mile in length at Shepperton, from Halliford Green to Ferry Lane.

BUCKINGHAM.—The Buckinghamshire county surveyor (Mr. R. J. Thomas), writing on the subject of road tarring and its effects on trees, says:—"I have not heard a single complaint of injury to trees or plants by tarred roads, although we have been using this method during the past five years—increasingly every year—for enabling macadam roads to withstand steel-studded motor tyres, and, as a secondary and less expensive object, for reducing dust."

BARNESLEY.—Between June 23rd and September 1st of the present year Mr. J. H. Taylor, the Borough Surveyor of Barnesley, tar sprayed about two miles in length of roads at a cost of £117. "The effect of tar-spraying the roads saved a considerable quantity of street watering, the estimated cost thus saved being £24 18s. 8d., leaving the nett expenditure £92 16s. 4d., or £46 9s. 2d. per mile of road treated. The effect upon the roads has been good. The improvement of the roads has been well worth the expenditure. Not only has it reduced to a large extent the dust, but, in my judgment, it has improved the surface of the roads treated, and will cause them to wear as macadamised roads fully one-sixth longer than they otherwise would have done."

HAMPTON WICK.—The Hampton Wick District Council has referred to their Highways Committee a proposal to limit the speed of motor-cars in the Hampton Court Road to ten miles an hour.

ORDERS have already been placed for the 1909 model Sheffield-Simplex, among them being one for the Hon. D. Farrar, of Otterburn, near the Northern Border, and one for Major A. E. Bingham, of Retford.

THE Woven Glass Accumulator Company inform us that the former agency for their manufactures has been cancelled, and that they have opened a branch office and warehouse at Dreadnought Works, Phillips Street, Aston Manor, Birmingham, where all business will in future be conducted.

CASES AGAINST MOTORISTS.

SEQUELS TO ACCIDENTS.

Mr. John Pearson, an engineer, of King's Road, Brighton, was charged before Mr. Curtis Bennett at Bow Street (London) Police Court, on the 1st inst., with manslaughter and with failing to produce his motor licence when requested to do so by a police officer. It was stated that on the Wednesday afternoon Mr. Pearson was driving his car in Parliament Street when he knocked down a man eighty-four years of age named James Talbot. With the assistance of a police-constable Pearson put the injured man into his car and drove him to Westminster Hospital. Talbot was there found to be suffering from an injury to his head, and he died the same evening. The case was adjourned, bail being fixed at one surety in £100, which was at once forthcoming.

At Marlborough Street, on the 1st, Cecil Jarrett, 21, a motor-car driver, of Norwich, surrendered to his recognizances before Mr. Plowden to answer the remanded charge of having caused the death of Minnie Miell by knocking her down with a motor-car. Mr. Chamberlain, solicitor, informed the magistrate that an inquest had been held on the woman, and a verdict of "Accidental death" was returned. In the circumstances the Commissioner of Police felt it would be useless to proceed with the case. Mr. Plowden ordered the defendant to be discharged.

£85 IN FINES.

At Camberley, on the 1st inst., Thomas Sopwith, of Cadogan Gardens, London, was fined £2 5s. for an offence under the Motor Car Act. It was stated that he has recently paid in fines and costs over £85 in connection with similar offences.

WHILE THE EMPLOYER'S IN CHURCH.

The story of a stolen Sunday morning ride by Arthur Parsons, chauffeur, who was at one time in the employment of Mr. Benjamin Womersley, of Huby, near Harrogate, was related before Judge Bompas in the Otley County Court the other day. Mr. Womersley, who is a local preacher, was due to take the service at the Burley-in-Wharfedale Wesleyan Chapel on Sunday, January 19th. He drove over from Huby to Burley in his 10-h.p. car, taking Parsons with him. On arriving, he went to the chapel, and gave Parsons 1s. to put up the car at the hotel opposite. Parsons, however, had previously written to a friend at Keighley to meet him at Ilkley. After Mr. Womersley was in the chapel, Parsons drove the car to Ilkley, and gave three men a lift on the way. His friend, however, was not there, and he returned at once. On the way back, he collided with the car of Dr. Bronner, who was driving to Ilkley. A claim was consequently put in by Dr. Bronner against Mr. Womersley. The first claim was for £51 2s. 6d., made up of £46 2s. 6d. for damages to the car and £5 for hire. This was met by the insurance company with whom Mr. Womersley was insured. The claim last week was for £50 for depreciation of car. The whole case turned upon the point as to whether or not the chauffeur was in the employ of the defendant at the time of the accident. It was contended that he was only engaged for a month, and that he received notice on the previous day to leave the following week. Parsons had no authority to go to Ilkley, but was instructed to wait at Burley until 1.30, when his master would be ready to return. His Honour said the drive to Ilkley was entirely beyond the scope of the chauffeur's employment, and therefore the master could not be held to be liable. Judgment was given for the defendant.

BATCHES.

On Saturday penalties to the amount of £81 were inflicted on motorists at Guildford; six convictions were recorded at Morpeth on the previous day. Other places where batches of motorists have lately been dealt with include Newmarket, Bromley, Feltham, Richmond, Wetherby, Cambridge, Christchurch, Forfar (15 motorists fined £24), Tamworth (3), Rugby (4), Liverpool (5), Petworth, and Epsom (5).

A SIXPENNY FINE.

At the Petworth Petty Sessions, John Hare, who did not appear, was represented by Mr. E. H. Staffurth on summonses against him for exceeding the speed limit at Coldwaltham on September 28th, and also for failing to produce his licence.—P.S. Marsh said the speed was 26 miles an hour, and when defendant was asked for his licence he told him he had left it at home. He was fined £3 on the first case, while on the second there was some difference of opinion as to a conviction. It was eventually decided to impose a fine of 6d. and endorse the licence.

WARRANT ISSUED.

At the Oxford City Court on Tuesday a warrant was issued for the arrest of the Earl of Berkeley, of Boar Hill, Wootton, Berks. It was stated that the defendant was summoned on June 26th for having driven a motor-car to the danger of the public. The Earl did not answer the summons, and though several adjournments had taken place the defendant had failed to attend the court.

THE trademark "Made like a Gun" will be very much to the fore during 1909, as the Enfield Autocar Company, Ltd., under their new management, are arranging a very progressive programme for next season. In addition to their standard 18-24-h.p. model, they will market a 10-12-h.p. "Popular" and a 30-35-h.p. car to meet the demand for a high-powered touring carriage. The standard vehicle will have embodied in it several new features, which are likely to attract considerable attention at the forthcoming show.

AUTOMOBILE ACCIDENTS.

THE fog which hung over London on the morning of the 1st inst. was responsible for several mishaps in which motor-cars were involved. A chauffeur in the employ of the Darracq Company was killed in a collision between a motor landaulet and a motor-omnibus at the Railway Bridge at Barnes, whilst Mr. A. Rawlinson had a marvellous escape. In the north of London, at Barnet, two motor-cars collided and were completely wrecked, the drivers and passengers all being thrown into the road and sustaining injuries.

At Mortlake on Saturday Dr. Michael Taylor opened an inquest concerning the death of George Charles, the chauffeur, of Edith Grove, Chelsea, who was killed in the collision which occurred at Barnes Common railway bridge on Thursday week. The Coroner said he was unable to proceed with the enquiry because Mr. Rawlinson, the owner of the car, who was sitting inside it, was now in bed from the effects of the injuries he received. A doctor said he would be able to attend in about a week. It was advisable that Mr. Rawlinson should be present when the two men who were on the omnibus gave evidence. They were the only persons who saw the collision. The inquiry was adjourned to Monday next.

As Sir Thomas Lipton was driving on the 1st inst. in his motor-car at Palmer's Green, London, N., on his way from his residence at Southgate to town, a collision occurred between his car and a bicycle ridden by Mr. Walter Cole, who was thrown to the ground. Sir Thomas, who was himself driving, rendered what assistance he could. A medical examination showed that one of Mr. Cole's ribs was broken.

As Mr. Luke White, M.P., and Sir Alfred Gelder were returning home late on Friday of last week in an automobile from a political meeting at Brigg, the car ran into the supports of a telegraph pole near New Holland, owing to the dense fog which prevailed at the time. The car was overturned, and the occupants were thrown out and much shaken. Mr. White and Sir Alfred Gelder stayed overnight at the Yarborough Arms Hotel, New Holland, and crossed the Humber to Hull on the following morning.

The Bridgwater Motor Co., Ltd., have arranged a two years' contract with the General Post Office, to deliver the mails between Bridgwater and Burnham by motor vehicle, and have had the 15-h.p. Mail Van, illustrated above, specially built for the work by the Argyll Company.

THE fatal motor-car accident which occurred at Old Trafford last week was the subject of an inquest held by the Manchester coroner. Miss Beguin, seventy years of age, waited on the kerbstone at the corner of Chorlton Street and Chester Road for a tramcar, and stepped into the carriage way presumably to stop an approaching car, but, finding it was not the vehicle she required, allowed it to pass. She made her way back to the kerbstone, and at that time the motor-car, containing the Mayor of Salford, the Mayoress, the chauffeur, and three others approached, travelling at about five or six miles an hour. When the motor-car reached Miss Beguin she stepped in front of it and was knocked down. She was so severely injured that death took place on the way to the Infirmary. After hearing evidence the jury considered it was an accident, and in returning a verdict of "Accidental death," exonerated the chauffeur from all blame.

THE Crypto Electrical Company, 155 and 157, Bermondsey Street, London, S.E., have a space at the Manchester Electrical Exhibition which opened on Saturday last. They are exhibiting their well-known alternating to continuous current transformer and continuous rotary converters. Also a complete range of alternating to continuous current motors and dynamos. The display is of special interest to owners of motor garages and others interested in the charging of accumulators.

FORTHCOMING EVENTS.

OCTOBER.

- 10th (Sat.).—Walthamstow Motor Club run to Hunsdon.
Auto Cycle Union's Council Meeting at Leamington.
- 11th (Sun.).—First International Road Congress and Exhibition opens at Paris.
International long distance balloon race, starting from Berlin.
- 14th (W.).—Incorporated Institution of Automobile Engineers. Presidential address at the Institution of Mechanical Engineers, by Mr. Dugald Clerk, F.R.S.
- 15th (Th.).—Mr. Knight's Paper at the R.A.C. on "Valveless Engines." Cycle and Motor Trades Benevolent Fund Banquet.
- 17th (Sat.).—Auto Cycle Union quarterly trial—Uxbridge to Banbury and back.
- 24th (Sat.).—Motor Parade and Gymkhana of the Blackpool and Fylde District M.C. at the Agricultural Show Ground, Blackpool.

NOVEMBER.

- 6th (F.).—Invitation Smoking Concert of the Stanley Cycling Club at the Queen's Hall, London, W.
- 13th-21st.—Olympia Motor Show, London.
- 14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club, Hotel Metropole, London, S.W.
- 18th (Wed.).—Annual Dinner of the Motor Union.
- 20th-28th.—Stanley Show at the Royal Agricultural Hall, London, N.
- 26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.
- 28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

- 23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

JANUARY, 1909.

- 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
- 26th.—Scottish Motor Trade Association Dinner at Edinburgh.

LIGHTING-UP TIMES—LONDON.

| | | | | | | |
|----------------|----|-----------|-----|----------|-----|----------|
| Oct. 10th—6.17 | .. | 12th—6.13 | ... | 14th—6.8 | ... | 16th—6.4 |
| " 11th—6.15 | .. | 13th—6.10 | ... | 15th—6.6 | ... | 17th—6.2 |

To find the approximate lighting-up time in October for Birmingham 6 minutes should be added to the above times, 2 for York, 8 for Manchester, and 14 for Glasgow.

POLICE "CONTROLS."

THE police have established a trap in the Watling Street, near Tamworth.

CLARENCE STREET, Kingston, has a ten mile limit with an accompanying police trap, in which some well-known motorists have lately been caught.

THE Elgin and Lossiemouth road has been the scene of police trapping operations on several days recently.

THROUGH the village of Harston, near Cambridge, motorists are being timed almost daily.

ON the Paignton road, between Longcombe and Berry Pomeroy, is a measured half-mile utilised by the police for catching speedy drivers.

AT Bromley (Kent) Common and in the main road at Sidcup motor controls have been established and are in frequent working order.

THE Epsom police trap has been fully employed at the week end.

TRAPS have been established on the highways between Forfar and Brechin; Kirriemuir and Cortachy; Arbroath and Forfar; between the fourth and third milestones from Brechin; and between Kirriemuir and Glenisla, all leading to Forfar Sheriff Court, where fifteen motorists have just been fined an aggregate of £24.

PUBLIC SERVICES.

THE Llandaff and Dinas Powis Council have given licences for the motor-buses from Cardiff to Llandaff to run through their territory.

MOTOR taxicabs have been placed on the streets of Glasgow by the Provincial Motor Cab Company, Ltd.

MR. F. F. WELLINGTON is turning his attention and abilities to the benefit of some English motor manufacturers, and we shall probably be able to shortly announce his new position.

MESSRS. FRISWELL, LTD., write:—"To save any misunderstanding, we beg to inform you that although the Societe anonyme des Automobiles Peugeot have opened a depot in London on their own account, and in future will do their wholesale business direct with the English and colonial agents, our position will in no way be altered, and we shall in future supply Peugeot cars and hold in stock, ready for immediate delivery, all the latest model cars produced by the Peugeot Company."

BUSINESS NEWS.

CHENARD-WALKER (England) have opened a new depot at 34, Shaftesbury Avenue, London, W.C., where examples of the new 8-9-h.p. single-cylinder car can be inspected.

MESSRS. EASTON AND MELVILLE, LTD., 85, Shaftesbury Avenue, W.C., have just completed some very exhaustive tests with a view to finding a suitable lubricant for gear-boxes, and, under the name of Gear Ilo, are introducing a special preparation which is claimed to possess all the advantages of oil and grease without their disadvantages. It is most economical in use, and preserves the gears, while the fact that the price comes out somewhat lower than that of a good grease is another point in its favour.

ON Wednesday and Thursday an auction sale of the plant and machinery of the Iden Motor Company, Ltd., at Coventry, was conducted by order of the liquidator.

THE Darracq team in the "Four-inch" race used Pratt's motor spirit, as did six out of the first eight cars that completed the ninth round.

IN addition to making fastest time of the day at the Sheffield A.C. Hill Climb, Mr. Albert Farnell's 30-h.p. Daimler secured the Harvey-Foster Challenge Cup and the Club Gold Medal.

THE winding up of the Brooklands season proved victorious for Shell motor spirit; all the motor vehicle events were won on the same.

OF the cars that finished the Four-Inch Race all save one used Vacuum Mobiloids. These well-lubricated cars included the Darracq team and the vehicle that made the fastest lap of the day.

IN conversation with Mr. Bignall, of the Acre Rubber Company, Ltd., last week, we gathered that his company's material and methods are still meeting with the satisfaction of clients. As an instance, it may be mentioned that the manager of the Aylesbury Motor Company, writing on the 21st ult., stated "The cover (810 by 90) you retreaded for us some time ago has now run about 5,000 miles, and we hope the tyre will last some considerable time yet. The outside has very few cuts in it."

ALL the cars that finished the Four-Inch race were fitted with Rudge-Whitworth wheels, and of the twenty-seven cars that had Dunlop tyres they obtained the first seven positions, as well as the ninth.

A POOR earth connection in the primary circuit of an accumulator system of ignition is often the cause of trouble. The connection should be well made in a place where it will be free from grease and oil and so securely fastened that it will not jar loose, as a connection which is partially loose and sometimes making a good contact and at other times practically none will cause a most erratic action in the engine.

ALTHOUGH motorists frequently blame the makers for the bad working of their acetylene head lights, the fault is more often due to careless cleaning and charging. When a lamp gives trouble the owner should make sure that he is following the correct instructions as to its method of working and that all parts of the generator have been thoroughly cleaned. If, after these points have been carefully attended to, the apparatus does not work properly, the advice of the makers should be sought.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, OCTOBER 17, 1908.

[No. 502.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

END EAVOURS are being made by the leading associations concerned with motoring and with cycling to bring about a good feeling between the two sections of users of the roads. Each has probably its grievance against the other; but it would be well if something could be done to present an united front on the road question and kindred matters which concern both motorists and cyclists. The latter can do something to

win the respect of the former by keeping well to the proper side of the road and by being content with a reasonable width of the highway when journeying on club runs. Most cyclists have apparently realised the danger of "hanging on" to motor-cars, but an official warning from the central cycling organisation should occasionally be issued.

Rounding Corners.

FOLLOWING the verdict of the jury which inquired into the death of the chauffeur whose car collided with a motor-bus in the fog near Barnes Common a few days ago, the jury added a rider suggesting that a speed limit of twelve miles per hour should be enforced on all motor-cars within a dozen miles of Charing Cross. Further, they recommended that the District Council should widen the narrow road in which the accident occurred. With this latter clause we are far more in accord than with the earlier suggestion. It has been proved over and over again that speed in itself is not necessarily a risk, and that a limitation to twelve miles an hour would by no means eliminate the dangers of the roadway. Much can be done to add to the safety of the highways if the District Councils would have a systematic and thorough inspection of the various corners within their area, with a view to rendering them safer to both pedestrians and drivers alike. Although this is not so urgent in urban and rural districts, there are many places where the advice could be usefully followed.

The Valveless Engine.

THE paper by Mr. C. Y. Knight on the Valveless Engine, which was read to an interested audience at the Royal Automobile Club on Thursday, is an important contribution to automobile literature. Mr. Dugald Clerk, F.R.S., who recently saw the engine at the Daimler works at Coventry, was in the chair, and introduced the author to the representative gathering. Mr. Knight told how he had obtained practically all the technical works on internal combustion engines as well as copies of all the patents issued in America covering such motors and their valve gear. These he studied in order to steer clear of beaten paths. Two years were spent in connection with the problem before any idea worthy of his consideration occurred to him. The story of the introduction to the Daimler Company is interesting. A mutual friend of both Mr. Manville and Mr. Knight told the former about the latter's engine. Mr. Manville asked for a catalogue, which was sent in the ordinary routine

way. This seemed to interest the recipients; and now Mr. Knight has publicly declared his obligations to Mr. Manville for "discovering" him, and to the Daimler Company for giving the facilities needed for refining what he termed "a diamond in the rough." Occasion was taken of the opportunity of the reading of the paper to announce a six-cylinder Daimler, which will be under test upon the road within a few weeks. The first consignment will be sent to enthusiasts in the United States.

The Inconsiderate Driver.

THE scheme of the Royal Automobile Club for dealing with inconsiderate drivers, in connection with which we would emphasise the view given by the Hon. Arthur Stanley, M.P., in our columns last week, is now getting into shape. An appeal may again be made to the Club to exercise its influence not merely by passing resolutions at committee meetings, but by the expulsion from membership of those whose heedless disregard of the rights of users of the road brings the whole motoring community into disrespect. The time for vague declarations has gone by, and motorists generally are hoping that the Club will now proceed to take action against known offenders when such steps are necessary.

Doctors' Cars.

ALTHOUGH there is not likely to be any fresh legislation with regard to motoring during the present Parliamentary year, an assurance conveyed in these columns some weeks ago, confirmed by Mr. Arthur Stanley, and subsequently given by some of our contemporaries, there is one little matter we do not propose to allow to be obscured. Nowadays doctors are becoming so dependent upon the motor-car in their professional work that the time has come when automobiles owned by those who minister to the sick and suffering might well be placed in a different category to those solely engaged in pleasure work. It is evidently only a matter of equity that such distinction should be made, and although we have not heard lately of the Committee of Medical Men that was prominent at the time of the Royal Commission, it is to be hoped that it is still organised on lines that may make effective protest in case of need. Accepting, then, the principle that doctors' cars should have special treatment, what should be the detailed scheme of taxation for such vehicles as compared with those in ordinary use?

Pavement Posts.

AN accident which has occurred in Cornhill—one of the generally crowded streets of London—owing to the presence of a pavement post near the kerb, suggests the desirability of securing something like uniformity in connection with these posts. As was pointed out at the inquest, some of these are flush with the kerb, while others are further into the pavement. The question of the adoption of these posts, as well as of centre standards and other such like devices in the streets of London, is one that deserves the earnest attention of the Corporation and of the City authorities. We are glad to notice that in Cannon Street the experiment has been continued in connection with the electric lamps in the centre of the road

way, these being suspended from wires on the buildings instead of from posts located in the roadway, thus obviating the presence of posts in the centre of the road.

The Proposed Main Road.

MUCH attention has been given to the suggestion emanating from the Salvation Army headquarters with regard to making a new main road through a large portion of the country in order to find work for the unemployed. The idea is one that is already finding much commendation; but it has some disadvantages in the fact that we require a roadway constructed with a view to meet the new traffic. Work that is intended to mitigate the horrors of unsocial conditions is not always the most sound; and we have in mind some schemes of public improvement similarly initiated that have proved anything but satisfactory after a few years. Therefore we trust that should anything be done with the proposal there will be a sufficiency of skilled labour to secure that the roadway shall be a permanent as well as a useful addition to the good roads of the country.

One of the Cars which took part in the recent flower fete organised by the Wurttemberg Automobile Club.

Trial Runs.

A QUESTION of interest both to buyers and sellers of motor vehicles has been heard in the Liverpool County Court, when a well-known firm of automobile dealers sued a gentleman for the cost of hiring a car on what was said to have been a trial run. The defendant had, through a second party, made known his intention of purchasing a car, and after a trial run from Liverpool to Blackpool and back had expressed himself as very well satisfied with the vehicle. He refused, however to purchase the car, and was subsequently sent a bill for the cost of the hire, which he declined to pay, hence the action. Judge Shand held that the plaintiff had failed to satisfy him that an arrangement had been made that the hire of the motor-car was to be paid for if it was not purchased by the defendant, therefore he gave judgment in favour of the latter. This question of trial runs is one that has considerably exercised the mind of the trade, and although it is not so great a business as in the earlier days, when the charm of novelty was associated with the motor-car ride, there are still people who, under the guise of prospective purchasers, secure free rides at considerable expense to the motor trade. The advisability of having some clearly defined arrangement is instanced in the case to which we have referred.

Speedometers.

FOLLOWING upon a letter of complaint which had been sent by the Scottish Automobile Club with regard to the speed of one of their vehicles in a village outside of Glasgow, one of the leading agency firms in the West of Scotland have arranged to fit speed indicators to every one of their vehicles used for service demonstration and hire purposes. They are exhibiting placards in their workshop to the effect that any excess of speed beyond the rates laid down and applicable to particular places which are constantly traversed by their cars will entail instant dismissal. The Scottish Club are directing the attention of other agents to this very commendable arrangement, and we would suggest its adoption by motor traders in other parts of the country beyond the sphere of influence of the Scottish A.C.

Bath's Leisurely Pace.

THE bath-chairs of Bath are still to be allowed to pursue their slow progress across the highway without having their speed accelerated by the competition of motor-cabs. There is a leisurely air about some parts of the old town, despite the excellent system of motor-buses and trams, and this has narrowly escaped destruction. Application was made to the Town Council that four taxi-cabs should be licensed to ply for hire in the city for three months. The hackney cab proprietors, like the silversmiths of Ephesus, arose in public meeting and appointed a deputation to go along to the Guildhall and raise their voices in protest against the proposed innovation. Their spokesman was able to say that taxi-cabs were not wanted; that the visitors protested against the present pace of traffic in Bath; what they would do if it was quickened by motor-cars—well, he couldn't tell. He made the declaration that "there was too much machinery already running in the streets." That settled the matter in a few minutes. The matter was deferred for six months—when the hackney cab proprietors will again appear, and probably they will say the same things again.

The Cost of Roads.

IN connection with the International Road Congress which has been held at Paris during the past week, the following computation by Lord Montagu as to the cost of British roads is of interest. The average cost of the 27,556 miles of main roads in Great Britain last year was £73 per mile, or an amount equal to £2,011,588 for the total mileage. It is calculated also that there are about 117,000 miles of good secondary roads, which have to be kept in order by district councils, urban and rural. If we take the cost of these at the low figure of £30 per mile, the expense of upkeep amounted to £3,510,000. If these two figures are added together, £5,521,588 is the total annual cost of the best and second best roads in Great Britain.

A Councillor's Protest.

At the Wimbledon Town Council, Councillor Edward Alphonsus Purcell tendered his resignation because of a recent conviction for negligent motor driving. He said in a letter he had been a most considerate user of the roads and careful of the rights of others, but, he added, "I am now branded as a road hog and my licence endorsed for an offence of which I am not guilty. As a ratepayer, I must protest against the police acting as prosecuting counsel for any corporate body. As a result of these proceedings I am practically deprived of my right in the civil courts, although I believe I have a good case. I must protest against my time and that of other people being taken up by being summoned before a Bench of magistrates, some of whom are physically unfit to deal with the cases that come before them. As a result of this, I am mulcted in two days' costs for a case that ought to be finished in less than half an hour." Several members having expressed regret at the action of Councillor Purcell, the Council decided to accept the

resignation, and the clerk was ordered to arrange for the necessary election.

Motor-car Imports and Exports.

A NOTABLE increase took place during September in the importation of foreign motor-cars and parts into this country. Of complete cars 270 were imported during the month, of the value of £104,705. The number of chassis imported was 333, valued at £113,192, while parts were responsible for £149,661, giving a combined total for September of £367,558, as against £277,391 in the corresponding month of last year. The gross imports of cars (3,300 in number), chassis (2,546), and parts during the first nine months of the current year amounted, however, to only £3,356,154, as contrasted with £3,610,826 in the corresponding period a year ago. Turning now to the section relating to the exports of British automobile productions, these again show a slight decrease—from, in the aggregate, £136,748 in September, 1907, to £110,788 last month. Altogether 205 complete cars (£69,701)

correctly points out that at the present moment the roads are in a transition state. Many counties have steam rollers at work, and in Co. Down, Antrim and Armagh there are some splendid roads in which those who own motor-cars will delight. The author is also hopeful of Co. Dublin, Tipperary, Limerick, Waterford, Cavan and Monaghan, the roads in which are improving rapidly. Co. Fermanagh has also some excellent roads, and those of Kerry, Donegal and Connemara are naturally of good quality. At the same time it is only right to point out that in these counties the average main road is very bumpy wherever there is heavy traffic—a fact that the cyclist has got over by using the footpath, to which delight the constabulary usually give no opposition. For those who contemplate spending any time in Ireland four special routes are planned out, saving the time in which the visitor can do the same. The gradients of the ordinary roads seldom exceed one in six, while, should the motorist wish to find in Ireland something like the Devil's Elbow or Amulree Hill, he will have plenty of danger at Glengesh Hill, in Donegal, with its double twist and gradient of one in seven. The mountain road from Killarney to Waterville,

The Frame of the Dirigible Airship which the Clement-Bayard Company are building. The balloon will be of exceedingly novel shape, while the motive power will be supplied by a 120-h.p. four-cylinder engine.

and 57 chassis (£12,497) were despatched from this country during September, as well as parts to the extent of £28,590. The gross shipments during the nine months ending with September are returned at only £883,968, which contrasts with £935,754 in the similar period of last year.

The Roads of Ireland.

THE many events in connection with automobilism that have taken place since the memorable Gordon Bennett race in Ireland have brought that country into prominence with motorists. Their progress, however, has been hampered by the want of such Contour Road Books as have been compiled for England and Scotland. Now, however, Mr. H. R. G. Inglis has finished his survey of Ireland, in which the County Surveyors rightly gave him much assistance, and the Contour Road Book of Ireland has been published by Messrs. Gall and Inglis. The usual features of the Contour Book have been adopted, and, so far as we have tested the information with local knowledge, every endeavour to secure accuracy has been successful. Mr. Inglis

the coast road from Waterford to Dungarvan *via* Tramore, or that from Draperstown to Plumb Bridge fairly bristle with dangerous hills, all of which are notified and described in the meritorious work before us.

THE Marquis of Ripon, whose resignation from the Cabinet is announced, has been a motorist for several years, and is a vice-president of the North Yorkshire A.C.

LE SOCIETE ANONYME DES AUTOMOBILES PEUGEOT have opened a branch of their own at 46, Knightsbridge, London, S.W., for wholesale and retail business in the highly-reputed Peugeot cars.

THANKS to the kind invitation of Dr. and Mrs. Cropper, of Mount Ballan, Chepstow, a very pleasant time was recently spent by some fifty poor cripples of Newport, Monmouthshire. The cripples were taken by train to Portskewett, whence they were conveyed in motor-cars and brakes to Mount Ballan. Cars were kindly lent by Mr. C. D. Phillips, Major Watts, Mr. Alexander Simpson, and the Monmouth Motor and Cycle Company.

Should the Tourist Trophy Race be Repeated?

THE EFFECT OF THE "FOUR-INCH" RACE—LONG v. SHORT STROKE ENGINES—SUGGESTED NEW REGULATIONS.

TO the various views with regard to the future of the Tourist Trophy Race given in our last issue we are now able to add those of a number of other well-known members of the motor trade. So far as our Symposium has gone there does not appear to be quite the same unanimity with regard to the discontinuance of the Tourist Trophy contest as exists in connection with the 2,000 Miles Trial, the majority of our correspondents being in favour of a repetition of the event. All are, however, apparently agreed that some revision or modification of the rules is desirable, the opinions in this direction being somewhat varied in character.

A SPORTING EVENT FOR PRIVATELY-OWNED CARS SUGGESTED.

Mr. Percy Richardson, the managing director of the Sheffield-Simplex Motor Works, Ltd., "would not be at all surprised to find the Four-Inch Race making itself evident in the design of touring cars, inasmuch that longer strokes to the engine will be adopted than heretofore, so as to get a more powerful engine under the same length of bonnet. Whether this is going to be a healthy alteration or not it is very difficult to say, and practice only will prove it; but I should be inclined to think that it will not be entirely developing in the line of the requirements of the majority of motor users, as it will complicate the question of the balance and niceness of running, resulting, I think, in sacrificing these very essential points to that of securing maximum power from a small sized bore. I am not in favour of either a very long stroke or a very short one, but rather a medium length enabling perfect balance, smoothness of running, with quick acceleration to be obtained. In engines of the size of the "Sheffield-Simplex," having $4\frac{1}{2}$ in. bore, I have found that the same stroke, viz., $4\frac{1}{2}$ in., is a very good combination.

As a sporting event for privately-owned cars only, and financed privately, I would like to see the Tourist Trophy race made an annual event. It greatly depreciates it holding it as purely a commercial affair. Should the Tourist Trophy race be held again, I think the regulations ought to be such that both the bore and the stroke of the engine should be fixed, and also the maximum weight of the car, and that the size of the engine should be such as to prevent the possibility of exceptionally excessive and dangerous speeds. When all is said and done, it is not pure speed in motor racing that makes it so exciting, but more a question of comparison between the speeds and the driving of the various cars, and my contention is, that if all the cars were compelled to be practically the same as regards the general determining facts, viz., the size of the engine and the weight of the car, it would then be brought down to a true sporting basis, and the result would rely on the quality of the car and the driver equally."

MR. JARROTT FAVOURS A THREE-INCH RACE.

Mr. C. Jarrott is another well-known member of the motor trade who does not "think the result of the Four-Inch Race will have a very great effect on the general design of touring cars, but I do think the manufacturers, in preparing the cars for that event, have learned some very valuable lessons, the result of which will be seen in touring models next year. My views on the long v. short stroke engine question are that extremes in either direction are bad. An excessively short stroke engine is inefficient, and an abnormally long stroke engine—although it may be powerful—is nevertheless hardly suitable in the hands of an ordinary user. I am not in favour of the Tourist Trophy Race being repeated in 1909, but I think that a race similar to that held this year, but confined to an engine having a 3-in. bore,

and with a maximum and minimum stroke fixed, would be very beneficial. If the race is run, I think the formula to be adopted for the engine size should be that recently suggested by the Society of Motor Manufacturers and Traders."

PREFERS SPEED AS THE ONLY FACTOR IN A RACE.

Mr. E. W. Lewis, of the Deasy Motor Car Manufacturing Company, Ltd., writes that he is "quite in favour of the Four-Inch race being held another year, as I consider that it has done more good than any other competition ever held by the R.A.C. The regulations were delightfully short, and the manufacturers' organisers had practically nothing to do compared with the amount of work necessitated by such an event as the 2,000 Miles Trial. There has been a great deal of discussion on the subject of long v. short stroke engines, but the effect of the race has helped to teach us very little on that subject. The long stroke engines undoubtedly give more power over the short stroke, but to my own knowledge an engine with a medium stroke is out and away the best. I think the manufacturers taking part in this year's race learned a great deal more about chassis construction than engine design, as a lot of those engines that had abnormal strokes and valves apparently gave no more power than the engine fitted with a normal stroke, say of $5\frac{1}{2}$ in., and the valves just over a third of the cylinder diameter. Taking the race on the whole, I should be extremely pleased to see it repeated, and I think a competition where speed is the only factor has more effect on the design of a car than a contest where particular stress is laid upon one point, such as petrol consumption. The speed race tends to improve the whole mechanism of the car, as every portion bears upon the result, whereas in the case of a petrol consumption trial the whole of the energy of the manufacturer is expended upon reducing the consumption, which, as a matter of fact, is of very small consequence when it is reduced as far as half miles, which is frequently done, and at the same time sacrifices a sweetly running engine. You will gather from the above views that I am entirely in favour of a repetition of this year's race being carried out in 1909."

THE RACE UNNECESSARY.

Mr. J. D. Siddeley, the general manager of the Wolseley Tool and Motor Car Company, Ltd., writes that "the views of this company in regard to trials, certainly for the coming year, are to the effect that such events are unnecessary; they lead to the expenditure of very large sums of money, the return from which is exceedingly doubtful." As regards the questions of the long v. short stroke engine and the probable effect of the Four-Inch Race on the general design of touring cars, Mr. Siddeley has sent us a copy of a letter he recently sent to the "Times" Engineering Supplement, in which he remarks that "there has been at all times during the history of the light internal combustion engine a conflict between designers on the question of length of stroke, and up to within a comparatively recent date the question had simply resolved itself into the following:—The longer the stroke the slower the speed of the engine; thus, with the piston speed remaining the same, the power output was fairly constant. To-day, however, designers have learnt that excessively light reciprocating parts can be utilized in the internal-combustion engine so long as wear is an entirely secondary consideration; therefore by designing a motor on these lines greater piston speeds are immediately possible, with a consequent increase in power, so much so that, whereas formerly it was only possible with a short-stroke engine to run at 2,000 r.p.m., it is now possible to run a long stroke engine at the same number of revolutions, it being also necessary, in order to gain this effect, to increase the diameters of

the valves to a very extreme degree. This development is, of course, extremely interesting, but it logically follows that, whereas it is possible to obtain 46-h.p. out of an engine of four cylinders, 4 in. bore by $4\frac{1}{2}$ in. stroke, when the stroke is extended to 6 in., $6\frac{1}{8}$ in., or $7\frac{1}{8}$ in., with the same number of revolutions, the power must naturally be very largely increased, such increases being, to all intents and purposes, almost proportional to the length of stroke. It follows that with the increased power the car itself cannot be light, and, in the writer's opinion, this power has not been obtained in the best manner. A more normally proportioned engine would be better in every respect, and when considering the best form in which to obtain power in a car, regard should be had to durability, comfort, smoothness of running, and general handiness.

"The length of stroke affects the comfort, for it can almost be accepted as a truism that, within certain reasonable limits, the shorter the stroke the greater the comfort, provided always that the motor is sufficiently powerful for the purpose for which the car is required; and it should not be forgotten that very high piston speeds, with very large valves, tend to increase the noise. As regards smoothness of running, there is no question that practical experience with the reasonably short-stroke motor has proved that it is far more comfortable and pleasanter to control than the long-stroke variety. Then, again, the powerful small-bore, long-stroke motor, with very high piston speeds, is quite out of the question, for in order to obtain high speed the carburettor must be adjusted in such a way that it is practically impossible to run the engine at the reasonable speed required for the ordinary motor; in fact, the normal number of revolutions of a motor as used to-day is more in the neighbourhood of 600 than 1,000. It will thus be seen that, whilst certain facts have been brought to light by this race, and whatever temporary effect it may have in unsettling the minds of the public on the question of the type of motor best suited for their purposes, the knowledge gained is not likely to have any serious bearing upon the design of the ordinary motor-car, which to-day rests upon a reasonably solid foundation, based upon considerable experience and the outcome of many experiments."

AGAINST ROAD RACING OF ANY KIND.

Another firm of motor-car builders, who, however, do not wish their name mentioned, have written us to the effect that they are certainly not in favour of the race being held again next year; in fact, they are against road racing of any kind. They do not think that the Four-Inch Race will have any beneficial effect on the motor trade, nor very much on the general design of touring cars. "Many will be going in for four-inch bore engines after such publicity being given, and they will be greatly disappointed that they do not get anything like the horse-power they heard talk of in the race."

The "Morning Post" publishes an article which is declared to be a declaration of the policy of the Unionist Party, in which the following reference appears with regard to automobilism:—"Motor vehicles should contribute by taxation more largely to the revenue. The sums derived from this source should be allocated to the maintenance of the roads. At the same time the experimental legislation now in force as regards the speed limit &c., should be revised in the light of experience, in the interests both of motorists and of the public."

THE BOYNE CYCLE COMPANY, of 38, Shop Street, Drogheda, have lately extended their plant, and are now in a position to undertake all classes of motor repairs. In connection with the inspection pit they have built, a useful arrangement has been adopted by means of which the employment of any light therein, with its consequent danger, is obviated. The pit is fitted with plate-glass side wings, which can be lifted up to any angle and reflect the light from above on any part under the car, even at night time, as the gas jets of the workshop are so arranged that the wings take up artificial as well as day light. They are made narrow, so when fully extended they do not seriously reduce the capacity of the pit.

CONTINENTAL NOTES.

The International Road Congress.

The first international Road Congress, convened under the auspices of the French Ministry of Public Works for the purpose of obtaining an exchange of views on the part of the most competent authorities in different countries concerning the best means of adapting roads to the conditions of modern traffic, was opened on Monday morning at the Sorbonne, Paris, by M. Barthou, Minister of Public Works. The response to the invitation of the French Government has exceeded all expectations, applications for seats at the Congress numbering over 2,250, of which 300 were from Great Britain. In his inaugural address M. Barthou said he felt the urgent necessity of dealing with this subject, and he pointed to the appropriateness of discussing it in a country which had taken the lead in the motor industry, and possessed a system of incomparable roads. Referring humorously to the progress of aerial locomotion, the Minister remarked that, pending its universal application, terrestrial highways required that care should be taken of them, and therefore he cordially welcomed the Congress. In presence of the immense increase of wear and tear of roads due to the introduction of motor vehicles, all the resources of science were needed to prevent their deterioration. The dust problem, too, must be seriously faced; there would be universal gratitude awaiting the labours of the congress if they resulted in the discovery of a practical solution.

The Road Mender.—Facsimile of the card issued in connection with the International Road Congress.

The delegates of the various nations responded, and Mr. H. P. Boulnois, of the Local Government Board, in speaking for his British colleagues, anticipated valuable lessons from French road-making. Alluding to the problems to be considered, he said that a traction-engine required a paved causeway, a bicycle a track like a billiard table, and a motor-car a road all to itself. It was easy to make a dustless road; but the question was how much would it cost? Later in the morning the exhibition of road materials which has been organised in the Tuileries Gardens was opened. The display comprises all kinds of appliances and materials connected with the construction and maintenance of roads, as well as specimens of pieces of roadway treated in various ways which have withstood heavy traffic for several years without appreciable damage.

Aeronautical News.

During the past week Wilbur Wright has made a number of flights with passengers on board at the Auvours camp, near Le Mans. Among those who went up with him on the 8th inst. were Major Baden-Powell, Mr. Frank Butler, Mr. Griffith Brewer, and the Hon. C. S. Rolls. His longest flight to date with a passenger was made on Saturday, when his machine remained in the air for 1 hour 9 min.—The Managing Committee of the Aero Club of France at its last meeting decided to award to the brothers Orville and Wilbur Wright its grand gold medal for the year 1908.—The "Auto" has just offered a prize of £480 to the first aviateur to fly from the experimental ground at Issy-les-Moulineaux across Paris to the Place Bastille.—The municipal authorities of Nice have voted a sum of £400 as

a prize in the Grand Prix d'Aviation which is to be held during the forthcoming season.—An international competition of flying machines is to be organised in connection with the electrical exhibition which is to be held at Brescia, Italy, in September next year.

British Motorists in France.

Recent British visitors to France with their cars include Mr. Powell (40-h.p. Daimler); Mr. Bradford (18-h.p. Daimler); Lord and Lady Haversham (20-h.p. C.G.V.); Mr. Messel (45-h.p. Charron); Lady Cunard and Mr. and Mrs. A. M. Huntingdon (75-h.p. Mercedes); Mr. and Mrs. Mitchell (30 h.p. Daimler); Mr. B. Trockmorton (45-h.p. Mercedes); Mr. Hugh Agnew (24-h.p. Sultan); Sir Henry Norman (40 h.p. Berliet); and Mr. and Mrs. Meissel (35-h.p. C.G.V.)

The 1909 Grand Prix Races.

The Sports Committee of the A.C.F. has submitted its proposal for the rules to govern next year's Grand Prix Race. The restriction proposed is 140 mm. as against 155 mm. this year, and the suggested weight is 900 kilos as compared with 1,100

the road, forming a paste with the road material which composes it. The paste, being impermeable to water, is quite hard, and, according to the inventor, resists disintegration for a long period. It is reported that the District Administration of Bridges and Highways intends to apply this method of tarring to some of the most frequented portions of the roads in the neighbourhood.

Motor Vehicles for Tropical Countries.

The German Daimler Company have just completed at their works at Marienfelde, near Berlin, a number of five-ton petrol lorries for use in German East Africa. A feature of the vehicles is that in addition to a radiator of unusually large size the dashboard is made in the form of an extra water tank, experience with automobiles in tropical countries having proved the necessity of an extra supply of water for cooling purposes.

A French Motor-Racing Track.

The Automobile Club of France recently appointed a committee to examine the question of constructing a special motor-

The Visit of the Grand Duke of Sachsen-Weimar to the new University at Jena, Germany.

kilos. The matter will be finally settled at the conference of delegates of national automobile clubs, which is to be held in Paris on the 19th inst., when a lengthy discussion is expected to take place. The question of allowing detachable wheels to be used has not yet been settled. For the 1909 Grand Prix des Voiturettes little change is proposed, single-cylinder cars remaining, as before, at 110 mm. bore, two-cylinders being increased from 78 to 80 mm., and four-cylinders from 62 to 65 mm.

Motor Vehicles for Postal Work.

A notable extension of the employment of motor vehicles in connection with postal work is to take place in Nuremberg, Germany, at the beginning of December next, when three 16-h.p. and six 28-h.p. vans are to be put in service for the transport of letters and parcels between the various sorting offices and the railway station.

Dust Laying Experiments in France.

A number of interesting experiments in dust laying have recently been made in the suburbs of Toulouse by M. Francon. The new process consists in applying several layers of liquid tar upon the road and immediately afterwards applying fire to them. Under the action of the heat the tar penetrates the surface of

the racing track. The committee, of which the president is the Marquis De Dion, has visited several possible places, but seems to be most satisfied with some land near the military camp of Ruchard, on the banks of the river Vienne, near its junction with the river Loire, where a track can be constructed 20 or 30 kilometres long, with straight runs of 8 to 10 kilometres. The track would not be difficult to construct, since there are natural embankments at the ends, which would need little alteration.

Miscellaneous Items.

The authorities of the municipal central electric lighting station in Copenhagen have lately acquired a 5-ton petrol motor tip-wagon, which is to be used for the transport of coal from the docks to the generating station.—Twenty-nine entries have so far been received for the trials of industrial motor vehicles which the Austrian Automobile Club is holding from the 20th to the 31st inst.—The German Sea Fishery Union, in conjunction with the German Society of Motor Manufacturers, is organising a competition of motors suitable for fishing boats. Full particulars can be obtained from the Deutsche Seefischerei Verein, Berlin, N.W., 6.—So far about thirty entries have been received for the Chateau Thierry hill-climbing competition, which is to be held on Sunday next.

GOSSIP FROM PARIS.

THE Anjou circuit is not yet officially designated for next year's A.C.F. Grand Prix, but there is little doubt about its being chosen. All the Communes through which it passes are unanimous in supporting the idea, and the Sporting Committee of the French Club shows a marked preference for it over all the numerous other proposals it has examined. The race at which the French hope to take their revenge for their repeated defeats is at the present moment occupying the minds of all the leading motor manufacturers, who are warmly discussing the regulations the A.C.F. will suggest to the International Congress of Automobile Clubs to be held in Paris on Monday. One maker whose cars will participate in the great international competition is not quite satisfied with them. Explaining why, he told me he considered the proposed bore of 140 mm. was still too large. He also regretted nothing was said about detachable rims and wheels, this being an important question which must be settled. Then, again, he feared the suggested minimum weight of 900 kilogrammes might be lowered by the Congress to perhaps 800 kilogrammes, which would be almost tantamount to granting the makers complete liberty. Many people here share my friend's opinion concerning the 140 mm. bore, because, with the reduction of the weight, the racing cars will be able to reach and perhaps exceed the speed of last year's cars, which wrought such havoc with the tyres. However, for some unknown reason the French delegates at the Congress are said to have received the mandate to refuse any further reduction in the bore. The Sporting Committee of the A.C.F. should be less authoritative, especially as every one remembers that it was the French Club which at the Ostend Congress insisted on fixing the bore at 160 mm. and obtained the adoption of 155 mm. for this year's race at Dieppe against the German proposal to establish it at 135 mm. It has, by now proposing 140 m.m. bore, already acknowledged it is not infallible.

THE organisers of congresses and conferences have a predilection for Paris. If two or three are not sitting at the same time in the Ville Lumière, they follow one another so closely that the grand amphitheatre of the Sorbonne is almost always occupied by one of them. They are all no doubt useful, but the International Road Congress held this week bids fair to be one of the most practical that has assembled here for a long time. It was on the initiative of M. Barthou, Minister of Public Works, that it was convoked. The beautiful macadam roads of France having proved incapable of bearing the wear and tear of the intense motor-car traffic, it was necessary to do something, and the Minister did not know what. The Congress has proposed various remedies for the present deplorable state of things existing not only in France but throughout Europe and in the New World. Some of them seem to promise excellent results in so far as the establishment of good roads and the diminution if not the removal of the dust nuisance are concerned. But those acceptable technical solutions are all costly, and the French are inquiring where the money is to come from. Since 1850, when the macadam roads were generalised in the country after the creation of the railways, which relieved the roads of so much heavy traffic, the annual expenditure for the repair of the State roads was cut down to a minimum. The macadam roads being cheap, the budgetary provision for them was, however, sufficient till the motor-cars commenced using them. Now they are in a most dilapidated state, especially in the vicinity of the great cities. If M. Barthou had not himself consulted the Congress with a view to the adoption of its suggestions there would be but little hope of any immediate improvement in France, on account of the financial difficulty. But it is to be hoped that what a high official of the Ministry of Public Works said to me is true. Alluding to M. Barthou's intentions, he quoted the French proverb "Celui qui veut la fin veut moyens." The means must, however, not be the further taxation of self-propelled vehicles.

To the joy of French aviators, M. René Quinton's National Aerial League is prospering beyond all expectation. I do not

know exactly how many adhesions it has already received, but the subscriptions have been sufficiently numerous to enable it to create a prize of 20,000 fr. (£800). It has also received donations of twenty-one bank notes of 1,000 fr. (£40) each, constituting a prize destined to bear the name of the donor. The conditions of the competitions have not yet been fixed, but at the first sitting of the directing committee of the League, held a few days ago, the technical committee was appointed. It comprises almost all the most competent authorities on matters concerning aerostation and aviation. This committee will assemble shortly to decide the feats to be accomplished to win these prizes. The league had previously named by acclamation M. René Quinton, president; Messrs. Archdeacon, Deutsch de la Meurthe, and Painlevé, member of the Institute, vice-presidents; Comte Celigny, secretary general; and M. G. Franchelli, treasurer.

WILBUR WRIGHT has gone on from triumph to triumph, and has every reason to be satisfied with the ovations he has received from the dense crowds of people who assembled to witness his

M. Leon Bollee, one of the pioneers of the French motor industry, and who is now interesting himself in the development of flying machines.

From a Caricature Sketch

[in the "Auto."]

flights. Last Saturday, especially when he broke all his own previous records for distance, time, and weight—he had with him on board the aeroplane M. Painlevé, member of the Institute—his performance was watched with thrilling interest by some 20,000 persons, comprising all the notabilities of aviation and aerostation and their patrons as well as the members of the Lazare Weiler scientific commission, who recognised the aviator had more than fulfilled the conditions of his contract. After Wilbur Wright's previous achievements it was not a surprise. Nevertheless his epoch-making officially-controlled flight, commenced in bright daylight and concluded in the darkness of night, sent such a thrill of enthusiastic admiration through the dense crowd, that some people, and among them many of those best able to appreciate the difficulties overcome and the importance of the result, were so choked with emotion that for a moment they could not join in the frantic acclamations of the excited multitude. On alighting from his seat beside Wilbur Wright, M. Painlevé exclaimed, "The conquest of the air is indeed achieved."

THAT was a recognised fact before, but this last demonstration banished the very last doubt still lingering in the minds of a few sceptics who, like St. Thomas, demanded to see and to touch before they would believe. As I said just a month ago in the *M.C.J.*, there is no longer any question as to whether aviation is practical or not. Man has made wings for himself, and it would be rash to attempt to predict a limit to the use he will make of them.

MARNEY.

THE SOCIAL WHIRL.

I REMEMBER Mr. F. H. Butler in the old days of the A.C.G.B.I., when we met for discussions in the room at Whitehall Court, S.W., and toured round Salisbury Plain and Stonehenge in search of automobile experience in the early holidays of every year. Those were the days when the motoring world was a comparatively small one, and was possessed of a sociability that has been dispelled as its ramifications have widened. From 1897 to 1902 Mr. Butler was hon. treasurer of the Automobile Club, and, in addition to motoring, took delight in skating, sailing and other forms of sport. Latterly he has gone upwards, and has made 120 balloon ascents, his latest adventure having been to accompany Mr. Wilbur Wright on his aeroplane. When asked for the sensation of flying as it occurred to him, he says "It is like gliding over sparkling water where you can see the bottom; turning corners and tipping the wings is like skating on the outside edge." Mr. Butler believes that there is practically no limit to the navigation of the air now that so much progress has been made, and suggests that the Trinity House may have to erect lighthouses on land to mark the way for aeroplanes at night. Now that the day of the lower priced motor-car is imminent, it is interesting to have Mr. Butler's prophecy that in ten years' time we shall be able to have practical aeroplanes for about £100.

THE King brought his stay at Balmoral to an end on Saturday. His Majesty travelled by motor-car from the Castle to Ballater, whence he trained for London. Early on Tuesday morning the King motored to Newmarket for the October Race Meeting. On the way a delay of half an hour occurred at Hatfield. Repairs having been effected, the journey was continued.

THE Prince of Wales concluded his visit to the Duke of Richmond and Gordon, at Gordon Castle, on Saturday afternoon. The Prince left by special train from Fochabers Highland Railway Station. Just as the Royal train left, a favourite dog of the Prince's appeared on the platform from the waiting-room. A motor-car was at once requisitioned and in this the terrier was taken to Orbliston Junction, and the news was wired that the animal would rejoin the party there. With the Princess the Prince is now enjoying a stay with the Earl and Countess of Shaftesbury at St. Giles's, Cranborne, Dorset. Motoring is entering largely into the delights of the visit, and on Tuesday Her Royal Highness, with her hostess, and the Countess of Mar and Kellie, Lady Katharine Coke, and Captain H. Campbell, motored to Winchester, where they were shown over the college, and lunched with the headmaster and Mrs. Burge.

THE Duchess of Bedford motored from Badminton to Clifton on Saturday, to open an exhibition of pictures in the Bristol Fine Arts Academy.

MR. WILLIE JAMES, with whom the King is to stay at West Dean Park, Chichester, is an enthusiastic motorist, and is the president of the Sussex County A.C. One of his first cars was a 12-h.p. Panhard, and subsequent possessions have included more than three Maudslays vehicles.

MR. FREDERIC COLEMAN, the European representative of the White steam cars, left by the "Mauretania" on Saturday for New York.

THE Irish Automobile Club continues to gain the support of the leaders of Irish sport and society. Recent additions to its membership include the Earl and Countess of Listowel and Lady Maurice Fitzgerald. Lady Fitzgerald is the daughter of Mr. H. L. Bischoffsheim, whose system of ambulances for London is well known.

LOLLIUS.

RYE AND WINCHELSEA.

(Concluded from page 685.)

A PART from the public buildings, Rye still retains many of those pleasant lanes and narrow walks which are the delight of those in search of the picturesque, and the confusion of others on business bent. But, unfortunately, modernity has found its way to the place, and in recent years a beautiful block of half-timbered houses, which rose gable after gable at the corner of West Street, was pulled down. A modern bank building now stands upon the site, and the residents are already forgetting the splendid group that once gave such a pleasure to the visitor. Further along West Street, however, several old houses still remain, one of them having a wonderful oak door, richly carved to represent the entwining white and red roses, by which many citizens showed their approbation of the union of Henry VII. with Elizabeth of York, which ended the long civil strife that had troubled England for years. In the Old Mermaid Inn, too, is a chimney-piece of Caen stone similarly embellished. Mermaid Street was once the principal thoroughfare in the town, and was then considerably steeper than now. Even in John Wesley's day it must have been more difficult of ascent, for in his diary he describes it as "near as steep as the ridge of a house." Those who motor should go with care, consideration and caution. In this street still stands a seventeenth century half-timbered house called the Hospital, because of its accommodation for the wounded in the days of the French war.

Leaving Rye, with its many other pleasant places, a scamper across the fields in the direction of Winchelsea brings us to Camber Castle, built by Henry VIII. and dismantled in 1642, since when grass has grown over its apartments, and sheep now graze within its walls. Winchelsea, which has contrived to maintain its old-world features far more successfully than neighbouring Rye, possesses a civic mace which dates from the days of the Tudors, and is thought to be the oldest in the kingdom. Originally the town was on the sea coast—three miles beyond the site of the present one. Here William the Conqueror landed on his return from Normandy to take part in the siege of Exeter. At that time it was of great importance, but a series of inundations in the thirteenth century rendered its existence somewhat uncertain. The direct way from Rye is by the military road, the surface of which is delightful to the man who goes by automobile.

In the days of its greatest opulence the town possessed three churches, two of which no longer remain to proclaim the religious activities of the people. The church of St. Giles stood within the walls on a spot within easy range of the rectory, while St. Leonard's, which also is no more, occupied a site outside the boundary to the north-west. Fortunately, the most important of these three sacred edifices has not been wholly sacrificed, and some portions attest its ancient character. It was situated nearly in the centre, and dedicated to St. Thomas, the Archbishop of the neighbouring county. It has been described "amongst the noblest specimens of the Decorated Curvilinear period—1315-1360—in the kingdom." Both at Rye and Winchelsea the oak was a popular subject for decorative treatment in the ancient days, for Sussex supplied much of the oak that was used in the "Wooden Walls of Old England"—vessels with which the inhabitants of all these coast towns were most familiar.

Looking out from the churchyard we see an ideal square, the grass peeping up into the roadway, and the broad space around indicating the prosperity that must have existed in the days of yore. On the west side of the churchyard is the ash under which Wesley is said to have preached his last open-air sermon. Even then, a century ago, he described it as the "poor skeleton of ancient Winchelsea," a description that will probably remain true for ages.

Of the house occupied by the Franciscans nothing remains, it having been pulled down in 1819, but the ruined chapel helps to tell of the extent of the original structure, and about the town are three old gates similar to those of Rye. Of these the

most ancient is the Strand Gate, which dates from the days of Edward I., and from whence the sea can still be seen. At that corner of the town I have seen Miss Ellen Terry in her pretty little cottage, where, amid the ancient glories of Sussex, she rested from the fatigue of her work.

Having exhausted the ancient buildings of Rye and Winchelsea, and remembered that the interior of the parish church of the former town was restored by Street in 1881-2, there is plenty of architectural interest in that corner of Sussex, but restoration has robbed the village churches of whatever beauties they were given by their original designers. Within a mile of Rye is Playden, with its Early English church, and a little further distant is Iden, with a church in the Perpendicular style. Within easy distance, too, is Peasmarsh, the proud possessor of an Early English church with a Norman chancel arch. From Winchelsea, as from Rye, small villages can be easily reached, and useful hours spent in studying the work of church builders of earlier days. Icklesham has a noteworthy pile, dating from the twelfth or thirteenth century, and, like so many others, restored. Two miles from Winchelsea, too, is Pett—a long, straggling village, whose church is of the

church has another distinction in the iron slab on the north aisle, bearing the date of the fourteenth century, and being one of the earliest authentic examples of Sussex foundry work—a branch of industry which has long quitted this county, washed by the sea and crowned with the noted Downs.

Ere leaving this part of the county it had better be said that a stay therein can form an agreeable combination of study and recreation. For, in Hastings, the county possesses not only an ancient seaside town, but a convenient centre for visiting the many fine ruins round about. Within easy reach is Battle Abbey, with its magnificent gateway; Normanhurst, the splendid seat of Lord Brassey; the picturesque ruins of the castles at Bodiam and Hurstmonceux, to say nothing of the ruins of the monastic house at Bagham, the Roman villa at Bignor, and the two or three ancient camps which remind us of the days when Sussex—"sleepy Sussex," as local tradition unwarrantably reminds us—was a county of wealth, industry, and importance. The note of battle frequently was sounded across its broad acres, and the many fine old remains of strong castles and fortified mansions almost vie in number with those of religious houses and holy cells. By the motor-car all these structures are accessible,

By permission of

The Ancient Parish Church of Winchelsea.

(The Hemelund Association.)

Decorated order, and was erected as recently as 1864. Throughout all these villages there are few domestic buildings worthy attention—and their rustic appearance with modern primness and brick fronts fails to equal the interest that attaches to a ramble in ancient Rye, where a local chronicler has not inappropriately observed, "nothing more recent than the cavalier's cloak and hat and ruffles should be seen."

But, perhaps, the most interesting of all these village churches, which can be easily reached from our headquarters or from the greater and more prosperous town of Hastings, is that which affords a sanctuary for the people of Etchingham. This must rank with Rye, Winchelsea (which Champneys said was "an almost ideal gem of uniform character and exquisitely studied detail"), Steyning, Bosham, and Boxgrove, these being the principal churches, from the architectural point of view, in all Sussex, excluding, of course, the cathedral at Chichester. In olden days the church at Etchingham was surrounded by a moat supplied, I believe, from the Rother, which joins the sea at Rye.

About two miles nearer the popular town of Hastings, and a pleasant walk from the village last named, is Burwash. Here is a very early Norman tower with the balustered windows, popularly described as Anglo-Saxon. But to many visitors the

and when the most noted places of the North have been explored those interested in the architecture of the past will find some of it in the old-world nooks of the Sussex coast. W. H. B.

NEAR the St. George's Cross, Glasgow—viz., at 432, New City Road—the Windsor garage has been opened for the accommodation of industrial vehicles and motor-cars engaged in commercial work. Mr. Alexander Kennedy, who has had considerable experience in connection with the garage at the Botanic Gardens, Vinicombe Street, Hillhead, Glasgow, is organising this new departure.

THE Motor House have issued an attractive catalogue of a new clearance list in connection with their accessories and clothing department. The terms of sale include the despatch of the goods on approval against cash, the firm being willing to return the amount that is paid provided the goods are returned to them in the same condition as originally sent. We understand that only a limited number of the many articles enumerated in the Catalogue are available in stock, so that early application is necessary to secure an opportunity of acquiring accessories, &c., on more than usually economical terms from the Motor House, Euston Road, London, N.W.

The Semmering Hill Climb.

The Annual Hill-Climbing Competition up the Semmering organised by the Austrian Automobile Club attracted a large number of entries. The snapshots reproduced above show some of the competing vehicles making the ascent.
(*Alignment Automobile Setting.*)

A CASE in which fraud in connection with the disposal of motor tyres is alleged is now being dealt with at the Bow Street (London) Police Court.

THE conference of provincial clubs with regard to affiliation with the central motoring authorities is to be held at Birmingham on the 24th inst.

THE Bishop of Newcastle (Dr. Strahan) has been presented with a motor-car by the High Sheriff of the county of Northumberland on behalf of 360 subscribers in his diocese.

THE world's motor-cycle record for one hour has been broken by Mr. C. R. Collier, who at Brooklands, on the 8th inst., covered 70 miles 105 yards in sixty minutes, using Pratt's motor spirit.

THE Dewsbury Motor Garage, at 42, Northgate, Dewsbury, has repair works in Trinity Yard, in the same town, which are open day and night for the convenience of motorists in that part of Yorkshire.

THE General Purposes Committee of the Guildford, Godalming, and Woking Joint Hospital has recommended that body to drop the proposal to purchase a motor ambulance, owing to the cost involved.

THE motor depot located opposite the tramway headquarters in Walcot Street, Bath, is now known by the name of Griffith's Motor Garage. Facilities for motor instruction and in driving cars are also provided.

MESSRS. T. R. BYE AND CO., of the Brixton Carriage Works, 56, Railton Road, Brixton, are, we learn, bringing out an entirely new design of Cape hood. The firm have for some years made a speciality of this class of fitment for motor vehicles, the moderate price of the same having secured for them many clients.

DURING her stay of eight weeks in England Mrs. J. Pierpont Morgan and her suite had the use of some very smart motor landaulet cars, which were placed at her disposal by the Motor Supply Company, Ltd., Piccadilly, W. She toured through the English Lake District and Scotland, and expressed her satisfaction with the running of the cars.

THE Coventry Motor Fittings Company, Coventry, have just completed the construction of a specially designed radiator to be fitted to a motor plough. The joints of the radiator are riveted throughout and the tubes have a worm and nut at each end so as to withstand the excessive vibration when travelling over rough roads. The two-cylinder engine, which will develop about 25-h.p., is being supplied by Messrs. Johnson, Hurley and Martin.

THE motor "Parkway" on Long Island, U.S.A., was successfully inaugurated on Saturday last. The course was to have been opened with the Vanderbilt Cup eliminating trials, but as these were unnecessary a sweepstakes race was substituted. There were various classes, the cars being required to make a specified number of laps of the Vanderbilt Cup circuit of twenty-four miles, the high-powered vehicles being allotted ten circuits. The winner was H. H. Lytle, driving an Isotta-Fraschini, who covered the distance at an average speed of sixty-seven miles an hour. Louis Strang, winner of the Briarcliffe Trophy, was second on a Renault.

WHEN in Leicester recently we had a short trial run on one of the latest Clyde 12-14-h.p. cars built by Messrs. G. H. Wait and Co., and were much impressed with its sweet and silent running. The feature of the vehicles lies in the transmission, which gives a direct drive on each of the three speeds. The motor, which is located at right angles to the usual position, is connected by a silent chain with a short countershaft just forward of the back axle. The change-gear pinions are always in mesh, one set being mounted on the countershaft and the other on the live axle, the requisite pair of wheels being made to transmit the power by means of dog clutches. The gear appears to be very efficient and quiet in operation. The Clyde cars, which range from 8-10-h.p. to 16-20-h.p., have an excellent reputation in the Midlands, and now that a London agency is being arranged they should rapidly increase in popularity in the South.

HERE AND THERE.

THE Derby County Council has rejected Lord Scarsdale's proposal to erect a number of motor warning signs within its territory.

LOCAL feeling is reported to be growing at Tunbridge Wells against motorists from a distance, who are alleged to drive through the town at a speed beyond the legal limit.

AMONGST recent purchasers of Imperia cars is Miss Cecilia Loftus, the well-known variety artiste, who has just ordered a 30-h.p. model from Messrs. C. E. Whittaker, Ltd., the British agents.

MR. W. C. HAWKES, A.M.I.C.E., the Borough Engineer of Dover, informs us that the gradient of the steepest portion of the Dover Castle Hill, on the Dover to Deal road, is 1 in 8.9, and the average gradient 1 in 10.

A NOVEL combination of advertising and delivery van has lately been introduced by the Novelty Parcel Van Syndicate, Ltd., of 41, Coleman Street, E.C. As will be seen from the accompanying illustration, the feature of the van is that the body is provided with a number of panels on all its sides, which are adapted to receive a series of advertisements. The latter are preferably of the size of a double-crown bill, but can be arranged to any size and are posted on revolving screens, which work at the rate of three revolutions per minute, rendering them quite

intelligible to pedestrians and others whose attention it is desired to attract. The advertisements are illuminated at night by electric lamps; the rollers and screens to which they are attached do not occupy more than about five inches on each side of the van, and are worked from one of the engine shafts, the absorption of power being extremely small. The announcements on the hood sideboards and end panels do not revolve, but are illuminated at night. In the standard size up to eighty advertisements per side can be carried in the eight windows, which measure 2 ft. 6 in. by 1 ft. 10 in. The cost of illuminating a standard-sized vehicle is about 3s. per eight hours. The standard vans are of the "Thames" type, with a capacity of two tons of merchandise, and may be either hired or purchased. They are peculiarly adapted to the requirements of carriers or parcel delivery companies, as the vehicle can be made in any form, from the small van suitable for the delivery of drapers' merchandise, or for the conveyance of a grand piano, to the requirements of railway and general parcel deliverers.

THE Irish Automobile Club, which has done much to develop automobilism in the Emerald Isle, is not satisfied with the action of the Society of Motor Manufacturers and Traders in attempting to veto the motor exhibitions in Scotland and Ireland. Now that the Society has given way so far as Northern Britain is concerned, many prominent Irish motorists are expressing the view that no invidious distinction should be made between Ireland and Scotland, and are advocating that the Society should withdraw its ban so far as Dublin is concerned.

THE London Fire Brigade has just put into service a petrol motor escape.

THE Cuban Automobile Association of Havana proposes to hold an automobile road race over a 21-mile circuit on the Island of Cuba in February next.

CAPT. W. G. WINDHAM informs us that the first general meeting of the new Aeroplane Club will be held at Claridge's Hotel, Brook Street, London, W., at 3 p.m. on the 6th prox.

MESSRS. "VALVELESS," LTD., have made application to the Technical Department of the R.A.C. for a long-distance trial (1,000 miles) of a 25-h.p. "Valveless" car. This will begin on Monday next.

THE Carmarthenshire County Council is offering a reward of £200 for information leading to the conviction of the driver of a motor-car who is alleged to have recently killed one of their road labourers and driven away.

THE district commissioners of Washington, U.S.A., have issued an order requiring motor "sightseeing" companies to refund on request the fare paid by any passenger whenever the motor vehicles fail to leave the designated starting-point within at least ten minutes after the time announced for departure, and to refund the fare if the trip be not completed.

MR. A. E. BENNETT, A.M.I.E.E. and A.M.I.A.E., the late official examiner to the R.A.C., is now practising on his own account at 25, Thrale Road, Streatham Park, S.W., as a motor

Photo by]

[Robinson, Streatham.

driving specialist, special attention being devoted to the coaching of intending motorists and motor drivers for the R.A.C. examination. The accompanying illustration shows Mr. Bennett at the wheel of the 12-16-h.p. Star car he uses for tuition purposes.

THE Bridges and Highways Committee of the Derbyshire County Council have had a discussion on the surveyor's motor-car. According to Councillor Trueman the purchase price was £600, and £200 a year has since been expended upon the running repairs.

NORTHERN motorists are familiar with the historic battlefield of Neville's Cross, near Durham, which is on the main road between Newcastle-on-Tyne and York. Mr. Thomas Phillipson has now added to the features of this interesting district by opening a garage and motor repair shop at Neville's Cross.

THE U.S. Office of Public Roads has just issued a pamphlet by Mr. R. Hubbard dealing with the subject of "Dust Preventives." In a preface by Mr. Allerton S. Cushman it is stated that the problem of dust prevention and road preservation is not isolated, but is clearly connected with all other problems pertaining to the construction, maintenance, and use of roads in general, and the author's aim has been to bring out these interrelations. The pamphlet contains a number of very clear half-tone illustrations, showing the effect of automobile traffic and ordinary traffic on ordinary macadam roads, and the methods of application of various dust preventives.

UP to the present 1,250 drivers' badges have been issued by the R.A.C.

MR. F. J. WILLIS, the L.G.B. inspector, will hold a public inquiry on the 24th inst. into the application to limit the speed of motor-cars passing through Barnet.

PARIS has now got a perambulating motor scissor grinding machine, the owner having fitted up a 2-h.p. motor to save him the trouble of working the usual treadles.

THE Winslow Rural District Council have advised a local correspondent who drew attention to the tar-paving of the streets to communicate with the County Surveyor on the subject.

A TEST of the utility of motor-cars for military purposes will be made by the U.S. War Department during the forthcoming manoeuvres of the regular army at Atascadero, California.

ON Wednesday week the Dundee Corporation took delivery of an Argyll fire tender, and the event was made the occasion for a visit to the Alexandria works by a number of the firemasters of leading towns in the West of Scotland.

MR. LIONEL PHILLIPS, the president of the Transvaal Chamber of Mines, and a leading authority in all that concerns the gold-mining industry, has acquired a 42-h.p. Daimler car through Messrs. Carr Bros. and Ash, of Johannesburg.

A MAN grotesquely attired and describing himself as the "Empire Scout," has been amusing himself lately by stopping motor-cars on the Grand Parade at Eastbourne. On Saturday he was ordered by the magistrates to be sent to an asylum.

So great is the interest in the forthcoming Grand Prize race which is being promoted by the Automobile Club of America, and which will be run on November 26th, that a grand stand with a seating capacity of 16,000 is being erected at the starting point.

ON Monday a meeting of representatives of City men was held at the Mansion House (London) under the presidency of the Lord Mayor, when a deputation was appointed to wait on the Corporation urging it to introduce legislation to suppress the alleged motor nuisances in the streets of the City of London. This will wait upon the Court of Common Council next week.

WE learn that Mr. F. J. Meeklenburg has taken over the garage at Skindlo's Hotel, Maidenhead, which has hitherto been run by Mr. A. E. Major, of Reading. The new proprietor is in a position to meet and supply all demands of motorists using the Bath road—viz., repairs, hire, vulcanising, charging, and supplying drivers and mechanics. The garage will be open day and night.

A SOMEWHAT novel experiment in road-making is being tried in the city of Newton, Massachusetts, under the direction of the U.S. Office of Public Roads. The new road is half a mile long, the foundation being as for macadam, but the top finish is a compound of pulverised stone and the thick, sweet, black refuse from sugar refineries known as molasses, which, it is stated, can be bought cheaper than gas tar.

THE Automobile Club of Australia recently held a petrol consumption test over a course from Sydney to Windsor, a distance of 69 miles. Altogether there were eleven entries, and two prizes were offered in connection with the competition. The principal prize consisted of a gold medal to be awarded to the car which, taking the weight, horse power, &c., into consideration, used the least quantity of petrol. This was won by Mr. E. G. B. Gerard on his 15-h.p. Talbot car, which used only one gallon seven and a-half pints of petrol, the distance covered per gallon being 35.6 miles—an excellent accomplishment for a vehicle of such power.

MESSRS. A. W. GAMAGE's sale opened on Tuesday last, and will continue during next week. Included in the large selection of stocks which are now offered is that of a West End motor clothing manufacturer, in which leather and fur-lined motor overcoats have a conspicuous place. In addition to the selection of motor garments the extensive range of goods on exhibition by the firm at their Holborn establishment also includes a number of motor accessories, which they are disposing of at prices which should tempt many motorists to replenish their stock of spares without delay. Lamps, tyres, sparking plugs, tools and other accessories have a place in the stocks, and a selection of accumulators, &c.

A "WASH" FOR MOTOR VEHICLES.

A VERY useful idea has lately been put into practice at the traffic department of the Barnsley British Co-operative Society, which now has no less than eight automobiles in service—three 5-ton Foden steam wagons, a Mann 2-ton steam lorry, two Arrol-Johnston 12-15-h.p. petrol

Fig. 1.—Details of "Wash."

vehicles, and two Dennis 35-h.p. machines. The owners take a pride in sending out their vehicles in a spick and span condition, and as they usually arrive home in a muddy state much time was taken up in cleaning the body and underparts of the chassis,

Fig. 2.—Vehicles in the "Wash."

until the utility of a permanent "wash" occurred to Mr. Elliott, the president of the society. Constructional details of the "wash" are given in Fig. 1, while in Fig. 2 are depicted some of the vehicles in the same, undergoing the cleaning operation. As will be seen, the pit is 7 ft. 6 in. inside width, and 38 ft. 3 in.

long, comprising a short incline at each end and a 16 ft. 6 in. level portion, enabling, if necessary, two vehicles to be washed at the same time. The wash is fed by surface water from the roof of the large covered yard, so that the cost of water is nil; a large overflow is provided to allow any excess to pass into the drain in wet weather. As the vans or lorries arrive in the yard after a day's running they are driven into the wash, when a man goes over them with a mop or brush to remove the mud; the machines are then put in motion, run up the incline and finished off with a hose pipe, the mud and dirt being left in the bottom of the wash, whence it is from time to time cleaned with a scraper. The arrangement, which takes up very little space, being constructed alongside the wall but with just enough room for a man to get round the vehicle, has enabled the cleaning operation to be effected in much less time than under the old system, and is highly appreciated by the drivers, who are encouraged to keep their vehicles clean and smart.

SOME USEFUL NOTES.

WHEN a sparking plug is being placed in the combustion chamber the points are very liable to be knocked out of adjustment by accidental contact with the cylinder-wall, especially when the operation is being performed at night. The resulting misfires, or the entire refusal of the motor to start, often seem quite inexplicable.

IN re-packing the gland of a water circulating pump use plenty of graphite with the packing. The spindle is seldom sufficiently lubricated, and the graphite will go a long way towards remedying this. Glycerine in the cooling water, as a frost preventative in cold weather, seems incidentally to considerably assist in lubricating the pump spindle. We have noticed it has been less frequently necessary to take up the packing during the winter in a car where it was employed.

THE following hints on fitting the Bowden wire mechanism, which have been issued by the E. M. Bowden's Patents Syndicate, Ltd., may be found useful by those motorists on whose cars the mechanism is in any way made use of. It is important that the inner member of the mechanism should be soldered before it is cut, as it is composed of a number of fine strands, which are liable to become untwisted unless this precaution is taken. With the smaller sizes, a pair of pliers or a spoke-cutting machine will suffice for cutting, but larger sizes will require a file or a cold chisel to sever the strands. The brass nipple supplied for the purpose should be carefully attached to the end of the inner member. A good method of effecting this is as follows:—The wire should be passed through the nipple, the end then being nipped flat for about $\frac{1}{8}$ in. This will prevent it drawing out again during the process of soldering. The nipple should then be held in the vice and carefully soldered, using a non-corrosive soldering fluid (on no account should killed spirit be used), care being taken that the soldered joint extends the full length of the nipple. Burr over the end of the wire, and finish off with a blob of solder. It will then be found impossible to remove the nipple by any fair means. When a single-pull lever is used it is necessary to have a spring at the opposite end of the wire to which the lever is fixed, in order to insure prompt recovery. This spring may be made to either pull the inner member back through the outer member, after pressure has been relieved from the operating lever, or it may be inserted between the stop holding the outer member and the end of the inner member, in which case, of course, it will be in compression. In the latter case it will generally be found that the simplest method of fixing is to fit the device up minus the spring, and to wind the spring on afterwards, as one puts a key on a split ring. Care should be taken that the inner member, on leaving the stop in which the outer member terminates, should be kept in an absolutely straight line, as, should it be otherwise, it will rub on the edge of the stop, and be gradually worn away in consequence. The inner member should be thoroughly smeared with motor grease or vaseline before being passed through the outer member.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

A FLIGHT IN THE WRIGHT AEROPLANE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—From the day I first met the brothers Wright, in the year 1896, I never had the slightest doubt as to the genuineness of their accomplishments or the correctness of their statements. I will therefore say nothing as to the wonderful capacity of their machines, which has been established for several years; suffice it to say that, after experience with every form of locomotion, including cycle and motor racing, a voyage in a dirigible balloon of the French army, and over 130 trips in an ordinary balloon, there is nothing so fascinating or exhilarating as flying. It gives one an entirely new sense of life.

Since the earliest flights in America, some years ago, I have followed the systematic progress of the Brothers Wright with great enthusiasm, and have of recent months been a frequent trespasser at the Camp d'Auvours, near Le Mans, France, where I have had the honour of many interesting talks on our pet subject with Mr. Wilbur Wright and his courteous associate, Mr. Hart Berg, but I never expected the privilege of an actual flight with one of the great brothers. However, the happy moment—I may say of my life—came while watching, in the early morning of last Thursday, some preparations and adjustments of the machine, when Mr. Wright suddenly turned, and, with his pleasant smile and quiet voice, said to me, "Mr. Rolls, I guess I'll take you up this morning!" Naturally my feelings would be difficult to describe. I had spent long periods in vain, to see a flight, once waiting there a week without seeing the machine emerge from its shed, owing to con-

The Limousine-Landaulet recently supplied by the Sheffield-Simplex Motor Works, Ltd., to the Rt. Hon. the Earl of Mar and Kellie, of Alloa, N.B.

The chassis is of the Sheffield-Simplex standard 45-h.p. six-cylinder type, having an engine of $4\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke (48-h.p. R.A.C. rating). The body, which was built by Hamshaw, of Leicester, is luxuriously fitted up, there being seating accommodation for seven persons. The Earl writes very enthusiastically of his new car, stating that even when fully loaded it has been driven over the hilly and winding road between Alloa and Kinross on top speed.

tinuous bad weather; but patience was now rewarded, and I was to have more than I had hoped for, viz., an actual flight.

Accordingly, when all was ready, I took my seat on the flyer, taking care to fasten my cap, for the motor was running well and we expected to attain some high speeds. The roar of the engine commenced, the starting weights were released, and off we went with a bound—but not a worse one than when starting on a switchback. Before reaching the end of the rail we had left it and were in the air—we were now flying. Once clear of the ground the feeling of security was perfect, and I was able to watch with great interest the movements of the operating levers. We tore along at forty miles an hour and soon came to the first corner. Here a point of interest to motorists was demonstrated, viz., that, no matter at what speed a curve is taken, the machine "adjusts its own banking," so to speak; at the will of the operator it tilts up gracefully when taking a turn, and is therefore equivalent to a motor-car tilting up the road in front of it, so that it is always "banked" to just the correct angle to suit the speed at which a curve is taken, all liability to skid outwards being thus avoided. Those accustomed to motor racing on road or track will appreciate the effect of this, which is that taking a curve on a flying machine will, instead of being more dangerous, be actually safer than on an automobile.

On this occasion our flight was more than usually interesting by reason of some strong side gusts that attacked the flyer on certain parts of the course, and we were flying at what Mr. Wright told me was the most difficult altitude, viz., just below the tops of the trees. The prevalence of these and other "undulations" of the atmosphere rendered very close attention necessary to the two levers controlling the equilibrium and altitude; I noticed that both these were

kept constantly on the "juggle" with slight movement. One has been accustomed to consider the atmosphere as a mass of air, decreasing in density with its altitude, but otherwise uniform; experience on a power-driven flyer, however, shows that, far from this being the case, the atmosphere near the earth's surface—even in what we call calm weather—is made up of spiral movements of varying diameter, sometimes vertical and sometimes horizontal, undulations of all sorts—little hills and valleys and "streams" of air—in fact, one might call it a new "world" conquered by man. A world of "scenery" of great variation, which, though invisible to the eye, is none the less felt by the operator of a flying machine.

To maintain equilibrium and steering control, while battling with these complex movements of the air, has been the great problem which for centuries has baffled human ingenuity, and which is now solved by the Wright Brothers after years of systematic study and experiment. Moreover, it is my belief that the Wright flyer is the only type of machine controllable against side winds and spiral currents; these can, of course, be avoided to a large extent by flying at high altitudes, but the disturbing currents near the ground have got to be encountered before landing. Sometimes we flew above the trees, sometimes we flew three feet off the ground, entirely at the will of the operator, who thus showed the most perfect control over his machine that anyone could imagine. The side gusts and varying currents which we encountered at times caused gentle dipping motions, not unlike a switchback, but always under complete control.

Our speed in the early morning caused tears to roll down our cheeks, but with goggles on one would have no difficulty in reading a map, making notes, or taking photographs, &c. After a flight of several miles a descent was begun for landing (for a moment the thought of a bag of ballast instinctively came to my mind); at the right moment the engine was stopped, and we came to ground so gently that I found it impossible to tell exactly when the runners first touched the surface. On landing we skimmed along the surface rather like a toboggan, coming to a standstill a few yards from our starting point. The sensation of flight was novel and delightful, and the fact of accomplishing what several eminent scientists have "proved" impossible gave also an added satisfaction. With regard to the "art" of flying, Mr. Wright and his machine seem to work together as one unit. The management of a machine of this kind in breezy weather, however, is not at all easy; at the same time, it can only require patience and careful practice before any intelligent man possessed of coolness and good judgment can learn it.—Yours truly,

CHAS. S. ROLLS.

TWO-CYLINDER ENGINES FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing the article on two-cycle engines in your interesting paper, I should like to give you my experience of same extending over the last seven years. You say against its advantages may be set its reputed unreliability, its unresponsiveness to throttle control, and its relatively low fuel economy.

My first motor was a 5-h.p. Lozier, and for five seasons ran in a 26 ft. launch without a single mechanical breakdown. I can only remember three stoppages; once a vapourizer spring broke, once a leaf got into the water intake, and once a foul plug stopped me for a few minutes. The whole cost of renewals for this period was the price of one new piston ring; the same plug was used the whole time.

At the end of the fifth season, as a Lozier man was in Chester looking to some other engines, I got him to look at mine to see if anything wanted doing, and he said everything was in perfect order, and absolutely no sign of play in the bearings. This boat got more than the ordinary share of work, as my partner, being a man of independent means, whenever I wasn't using it he was. It was with great regret that I parted with her, and the reasons were these: firstly, you could not advance or retard the spark; secondly, the throttle was unsatisfactory, and you had to go more or less at full speed all the time, which was dangerous on a crowded river. The man who bought the engine put her into a sea-going cruiser, and I heard that she went to the Isle of Man and up the Menai Straits without a single hitch; all this shows that at any rate she was reliable.

My second engine was a twin-cylinder Ajax 5-h.p., with which I have now finished the second season. She is quite as reliable as the other; I have had a little trouble with the commutator, which wore slightly, causing missing, but a new one replaced by the makers free made that all right. The throttle control is absolutely perfect; I never once touch my spark after once starting, the throttle controlling her from about three miles up to full speed, which is about eight miles. If I wish to go very slow I simply switch off one cylinder, turn off petrol (having two carburettors) and amble along at one or two miles an hour. I have never tried how far I can go on one gallon of petrol, but, as far as I can guess, the distance is about ten or twelve miles.

I saw in a motor journal the other day about a certain Motor Car Club dinner, where Mr. So and So gave a humorous sketch on how

start a two-cycle motor, which caused roars of laughter. I wish this gentleman had been with me last week to have seen a chauffeur trying to start a 14-20-h.p. four-cylinder car; he would have been able at the next dinner to have given another sketch on how to start a four-cycle motor. I should think this man took at least a quarter of an hour before he could get the engine to start up. I will guarantee to start my Ajax after standing for a week at the second turn of the handle, which is more than I can do with my car.

I hope this letter is not too long for you to publish in full, as one seldom sees anything about two-cycle motors, and perhaps others will give their experiences.—Yours truly,

A. A. EVANS.

THE O.T.A.V. VOITURETTE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your enquirer "Welland" as to the 5½-h.p. O.T.A.V. voiturette, I am pleased to give the opinion that he asks for, as I have been an owner of one of these little cars for the last three months, and have driven it quite a lot in and around London. I find that it takes nearly all the reasonable hills on its top speed, and on the Maidstone road, which I consider quite a difficult one, I have driven from London to

to open a fund for the assistance of the family. I therefore appeal with confidence to your readers for subscriptions to such fund, which I trust will to some small extent relieve the pecuniary anxiety occasioned by this remarkable accident.—Yours truly,

G. LAWRENCE,
Mayor of Bromley.

KNOCKING IN THE ENGINE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to invoke your aid in the following trouble. There is a perceptible hammering taking place somewhere in the engine of my car which I have so far been unable to locate. It is not due to the ignition being too far advanced, for it is present when the spark is retarded. I took the advice of a fellow motorist and cleaned out the cylinder with paraffin to loosen the piston rings in case they were sticking, but the hammering still continues.—Yours truly,

J. BATEMAN.

[Our correspondent's trouble may be due to many things; a loose bearing may in all probability be the cause, or premature firing may be occasioned by the cylinder heads being foul or carbonized. The only remedy for this is to remove the cylinders and thoroughly clean the heads;

Touring in Belgium.—The Citadel of Namur from the suburb of La Plante.

Maldstone at an average speed of over twenty miles per hour, and with only one change of speed on the ascent out of Farningham. I find the engine keeps very cool, is not greedy for lubricating oil, and I should think my petrol consumption is about thirty miles to the gallon all round. As to tyres, so far I have not had a puncture, but this may, of course, be luck. The only fault I have to find is that there is a certain amount of vibration if one attempts to drive the car at over twenty-five miles per hour.—Yours truly,

T. W. JAMESON.

A DESERVING CASE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your readers are of course aware of the burning of Signor Scarfoglio's car, which occurred at Bromley, Kent, on the 25th ult., while the petrol tank was being emptied prior to the vehicle being placed on rail for Folkestone, and I am sure that all sympathise with him on the destruction of his car on the completion of the memorable journey from New York to Paris.

What, however, is more lamentable is the fact (which perhaps is not known) that the accident caused the death of a young Bromley motor mechanic named William Maynard, who was engaged in emptying the tank, and when the vapour took fire was so terribly burnt that he succumbed to the shock from the burns received. Maynard had a widowed mother partially dependent upon him, and I have been requested

at the same time it will be possible to see if all the bearings are in good condition.]

FRONT TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Frequently I hear motorists say that as soon as a certain tyre has "done a bit more" on the back, they will put it on the front, therefore is it a matter for wonder that we hear of so many accidents resulting from burst front tyres? I am very careful of my neck, and therefore always put my best tyres in the front, and when they begin to look doubtful they go on to the back, to be driven there as long as they will last. I wish that motorists in general would be equally cautious, not only for their own sakes, but also to reduce the opportunities which the motorphobes so love for screeching against motors.—Yours truly,

A. DUCKHAM.

Will the firm whose registered mark for motor-cars is "A. A. P." communicate in confidence with the Secretary of the Automobile Association, Princes Buildings, Coventry Street, London, W.?

MR. H. WHITE, cycle and motor engineer, Adela Avenue, West Barnes Lane, New Malden, S.W., writes that he has had a motor wheel hub cap brought to him which was found near West Barnes Lane, New Malden, about three weeks ago. Mr. White writes that the cap appears like one from a commercial motor vehicle, and that the owner can have same on application.

THE VALVELESS ENGINE.*

By CHARLES Y. KNIGHT.

THE present high speed internal combustion motor, with its phenomenal speed and power, is the result of evolution rather than revolution or invention, and few individuals, since the days of Gottlieb Daimler, can lay claim to any great amount of credit for the efficiency of the present type. Prior to entering into a technical discussion of the new valveless motor, I feel that those who have been indulgent enough to give up valuable time for the purpose of hearing more about it than has been exploited in the press are entitled to something of the history of its origin and development. We did not bring to the Daimler Company an untried proposition; we brought a practical, although not refined product—a motor which had already stood the test of public use for two years and came through with clean records. The only feature regarding which we made no representations to the Daimler management was the matter of power as compared with the other type. The end I had in view of accomplishment seven years ago, when I first began thinking of the possibility of improving the existing type of motor, was principally the elimination of the annoying clatter of the poppet valves.

Before deciding to discard the time-tried mushroom valve, I devised many schemes for subduing the clatter of the cam against the tappet. But I soon perceived that efforts in this direction could afford but temporary relief at best. In order to ensure the valve seating, there must always be clearance between the cam and the tappet, and clearance meant a hammer blow when the valve was lifted. I then considered a plan to open and close ports at the top of the cylinder, the same as is done at the bottom in the two-stroke motor, using an additional inverted piston at the top, reciprocating this inverted piston $1\frac{1}{2}$ inches, and using sliding cut-offs on either side of the cylinder to time the closing of the exhaust and the opening of the intake.

Then the idea came to me, "Why not a cylinder within a cylinder? Instead of moving all the heavy walls of a water jacket why not employ cast iron liners the full length of the cylinder and move them up and down over the inverted piston, using a wide ring at the bottom of the latter to entirely cover the ports at the time of compression and explosion?" The extension of the sleeves down into the base chamber, where they could be very conveniently connected to an eccentric shaft, would make their operation simple. Devising the exact motions required of the sleeves to properly time the openings and closings of the ports was a more nerve racking undertaking than endeavouring to solve the Fifteen Puzzle, made more so by the fact that my first three years' models and all we are running in America to-day have, in addition to the inlet and exhaust ports at the top, a Clerk port at the bottom to be uncovered by the piston upon its power stroke, the timing of which must be taken care of in the motion.

The proof of the pudding is the eating of it—not the chewing of the string. Regardless of the doubts of those who have not taken the trouble to study the question, a new motor has been evolved which has withstood every test of time and of the sceptical experts, and has found conservative, hard-headed engineers and boards of directors who are willing to stake their reputation that it is undisputably superior in every respect to the type which has hitherto been practically accepted as the only successful four-stroke design. Experimental work began upon this motor five years ago last August. The first model was $3\frac{1}{2}$ in. by 4 in. single-cylinder horizontal. It was operated successfully through the use of but one sleeve, but the gear necessary to give it the proper motion was too complicated to be quiet, and this construction later gave way to two sleeves driven from an eccentric shaft. During the summer of 1904 a four-cylinder engine, $3\frac{1}{2}$ in. bore by 4 in. stroke, was built and put into a Panhard type car which I had driven for two years. This motor is running to-day in the self-same vehicle. We designed and constructed our first experimental car in the spring of 1905, this being equipped with a four-cylinder 4 in. by $4\frac{1}{2}$ in. motor with practically no change in the design. This car is also in service to-day. I can conscientiously say that during the two seasons which I drove this first motor after its first testing out I never was obliged once to stop on the road because of motor difficulties. My partner, Mr. Kilbourne, drove his car, the first model of the 4 in. by $4\frac{1}{2}$ in., 15,000 miles the first season, and about 8,000 the second. The motor-car was new to him, but only twice during that time did he ever require assistance upon the road, and in neither case was the fault with the motor. Late in 1905 we put in a plant and began the manufacture of cars.

We restricted our efforts to seven cars the first year, one for a demonstrator and six for the market. This was in 1906, and every one of these six are running to-day, with no portion of the motor peculiar to our design replaced or worn out. The mechanical success of our 1906 cars encouraged us to lay down fifty for 1907.

I have told you we have perfected a motor along new lines. The question now arises "What advantages over the standard motor have you shown those concerns which have taken up the idea?" In answer to this hypothetical question, I answer:—First, we have demonstrated absolute silence—the genuine absence of sound when under load. Second, we claim extraordinary smoothness of operation. The sensation of riding in a car propelled by one of these motors is distinctly different from that experienced in a vehicle where eight hammers in form of valve tappets are continuously pounding away to produce a tremor or vibra-

tion which is felt throughout the entire car. As speed increases, the difference between the new type and the old becomes even more marked. Third, we claim greater flexibility. Given a fly-wheel of average weight and regardless of compression, one can do almost as he pleases with these motors. From four and five miles an hour up to sixty without change of gear is not difficult with the standard 38-h.p. Starting on the direct drive from a standstill is not confined to level stretches, and is possible on fairly moderate grades. In short, we believe the flexibility of this motor approaches so closely that of steam as to leave very little to be desired. Our fourth claim we feel also may be misplaced, and might well come well forward. That is for reliability. We believe the motor to be as near fool-proof as any piece of power-producing mechanism that has ever been devised. But "What," someone asks, "will happen to this motor if it is not properly lubricated, or if the weather gets cold, and your oil is bad and gums up and sticks, and you try to start it, or if the water runs out, or in case of a thousand and one possibilities of neglect?" And in turn I ask, "What would happen to your poppet valve motor if subjected to this same sort of abuse?" Fifth, we claim greater fuel efficiency under normal conditions than of the "Otto" type. Upon the bench we produce one horse power for an hour with from '54 to '64 pints petrol, according to compression pressure. Sixth, we claim much greater working endurance. The tendency to lose power on the brake under continuous load, which is so frequently the case with other types of motors in time, is not characteristic of this engine. There are no valves or valve seats to warp, heat or break, or springs to weaken under continuous heavy work. One of our 114 by 140 mm. motors, under a test in a Continental establishment, has been under full load upon an electric brake nine hours a day for more than fifty days at speeds ranging from 800 to 1,650 revolutions per minute, and it is as steady under power as a clock, never varying in power or speed from the opening of the day until its close. Seventh, we claim great power and speed. The Daimler Company have settled upon a compression which gives slightly over 57-h.p. at 1,200 revolutions per minute, for the 38-h.p. R.A.C. rating. This motor is capable of being accelerated up to 2,500 revolutions per minute, or throttled to less than 160 revolutions per minute. This compression was chosen, not because it might not safely be exceeded and more power thus secured, but because its chassis was designed for about that amount of power. Up to 100 lbs. gauge compression the motor is as silent and flexible as at 75 lbs. The only disadvantage we have found in the high compressions is the possible necessity of more frequent cleaning of the carbon from the piston heads and combustion chamber. But as this, with our construction, is a job of not over an hour for four cylinders, because of the use of detachable heads, the problem of carbon is never serious.

We have driven motors of this type with compression ranging from 45 lb. to 95 lb., and tested them upon the bench to as high as 114 lb. gauge. We have come to the conclusion that for the general public which wants a car with "ginger" in it, the 75 lb. compression is about right. With this compression a fairly intelligent driver should easily do twenty miles to the gallon of petrol and run 450 miles to the gallon of lubricating oil.

Every designer of multiple internal combustion motors understands that smooth running depends upon perfect explosive as well as mechanical balance and not over-heavy reciprocating parts. Proper explosive balance cannot be acquired except with even compression pressures throughout the various cylinders, and such evenness is not possible when the volume of combustion spaces are unequal. In the new motor every inch of the surface of the explosion chamber is machined to dimension. This makes explosive balance a certainty. These machined and polished walls have also the advantage of presenting no projecting particles upon which carbon can burn and become sufficiently phosphorescent to prematurely fire the charge. In the matter of gas passage, the design affords an almost unlimited choice of capacity. We can, if desired, make the openings equal to the area of the entire bore of the cylinder. It is merely a matter of eccentric stroke. We have, therefore, no problems in the filling and scavenging of our cylinders.

(To be concluded.)

MESSRS. BARLOW AND CHIDLAW, LTD., of the Pendleton Gear Works, Manchester, are making a speciality of the production of accurately cut gear wheels for automobile purposes.

THE Atlas Re-linent Road Wheels, Ltd., Manchester, who are specialists in the manufacture of steel road wheels for all classes of vehicles, are issuing their illustrated catalogue in French, German, Spanish, and other languages.

THE Daimler Company have received an order from the Roseleigh Motor Company, of Glasgow, for a 58-h.p. car required for shipment to Mr. J. M. Neil, Koko Factory, Benin River, via Forcados, Southern Nigeria, W.C. Africa. A description of the new Daimler engine is now being distributed by the Daimler Company, and copies will be forwarded to all readers of the M.C.J. on application to the Daimler Motor Company (1904), Ltd., Coventry.

MESSRS. ILLSTON AND ROBSON, of Herbert Road, Small Heath, Birmingham, are making a neat form of ball joint for use in connection with car uretor and ignition control levers, &c.

MESSRS. MACDONALD AND SON offered more than seventy motor-cars for sale by auction at their mart in Annandale Street, Edinburgh, last week.

*Abstract of paper read to the members of the R.A.C. on the 15th inst.

SOME PROBLEMS OF THE MOTOR-CAR.*

By DUGALD CLERK, F.R.S., M.Inst.C.E.

I PROPOSE to deal broadly only with several points which appear to me to be of fundamental importance; we have solved many problems which seemed, even so late as 1901, to present a rigid barrier to progress. In that year it will be remembered that the Automobile Club held its 600 miles reliability trial, starting from the Glasgow Exhibition; as I acted as one of the judges there I had ample opportunity of becoming acquainted with the condition of the cars during and after the week's run. Most of the cars showed signs of wear, and some severe wear, within the short period of a week. Brakes, too, gave much difficulty, especially in holding against running backwards down hill. Clutches were troublesome, and noise and vibration was often distressing. Engines were ill-balanced and noisy; control was often accomplished by advancing and retarding the spark, and automatic inlet valves were common. The Automobile Club trials of 1903, at the Crystal Palace, showed greatly improved results, and again acting on the judging committee, I had the opportunity of inspecting over 100 cars, after the wear of 1,000 miles' run.

Ever since 1903 marvellous progress has been made, and most of the difficulties of the engine, clutch, change-gear and transmission have been met with such success that the flexible and smooth-running car of to-day appears to many to present no further problems for the energy of the automobile engineer. To others the present cars appear to embody only partial solutions of many problems.

The clutch, for example, even in its best form, is a contrivance which should be abhorrent to the soul of the mechanic. When we consider the number of foot tons of energy which may be stored up in the moving parts of the engine and the large resisting mass of, say, a heavy landaulet, it is surprising that unduly dropping in of the clutch by a careless driver does not more frequently result in serious damage. The clutch is, however, undoubtedly responsible for much of the wear of motor mechanism. It has long seemed to me possible to design a pneumatic clutch connecting the engine and the driven shaft, so that no violent shocks could reach the transmitting mechanism. Such a clutch would consist essentially of two or more cylinders mounted on the end of the driven shaft and rotating with it, and a crank on the end of the engine shaft connected to two or more pistons working in the rotating cylinders. The pistons would compress the air in the cylinders until the necessary driving torque was communicated to the driven shaft, when pistons and cylinders would rotate without further relative movement. To declutch it would only be necessary to open a valve controlling the cylinders, when the engine would be at once freed from the car. Such a contrivance would be easily adjustable to apply any desired torque without shock. No severe starting shock could reach the transmission gear because of the elastic air connection.

Change-speed gear also seems to be a very inferior mechanical device for varying the effort made possible to the road wheel. This has been much felt by motor-car designers, and perhaps more mechanical ingenuity has been expended by them on various methods of getting a wide range of intensity of wheel effort with changing gear than on any other part of car mechanism. Efforts on one mode of development have been devoted to varying the ratio of revolutions between engine and driving wheels by mechanism which avoids the use of toothed wheels, which have to be slipped in and out of gear with each other, and many ingenious inventions have been produced. For example, epicycle gears, in which the driving and driven wheels for the various speeds are always in mesh, in which each set is called into operation by brake devices; reciprocating pawls, operating ratchet wheels, where provision is made for varying the angle of pawl reciprocation; disc friction gear, in which a friction driving-wheel is moved over the surface of a driven disc; conical pulleys, with shifting driving-belt; and hydraulic gear, in which a pump is driven by the engine, and the liquid from the pump actuates a hydraulic motor. The system of gear-changing by sliding toothed wheels, notwithstanding its apparent mechanical crudity, has proved to be the principal survivor in the struggle, and its efficiency of action has certainly been greatly improved.

Other efforts have been directed to the improvement of the petrol engine itself, with the object of dispensing with change of gear ratio as much as possible, and accordingly this mode of development has produced the moderately high-power car of to-day, with its direct drive, live axle and highly flexible engine. Such cars travel over quite a hilly country at varying speeds, within wide limits, without changing gear. Success in this direction requires an engine capable of giving the maximum torque required by the road wheels on steep hills while geared on the direct drive, and, of course, it involves a powerful engine which runs at a very light load at customary speed on the level. For the greater part of its running, the engine will be only developing about one-fourth of its maximum power in order that the full power may be available for hill-climbing, without requiring change of gear. The necessity of carrying about this heavy and powerful engine, for but a small use of

its full power, has been justly recognised as a disadvantage, and many methods have been devised for temporarily increasing the driving torque to be obtained from a small engine. Such methods include: the petrol-electric car, in which an accumulator supplies an electric motor, giving power to the driving shaft when the resistance to motion increases sufficiently and the electric motor acts as a dynamo and charges the accumulator when the engine is running under conditions of lighter load, and proposed air-reservoir cars, having pumps to fill up the reservoir, which, in turn, assist the engine when required.

Other inventors seek to increase torque by providing air pumps supplying the air and petrol charge to the engine under a pressure above that of the atmosphere. They, however, require a heavier engine to withstand the higher maximum pressures of explosion; and although the cylinder dimensions remain small in reality, the weight of the motor, to provide the same margin of safety, requires to be increased as much as it would be by using larger cylinders. So far attempts to increase the torque of a small power light engine have failed; it is very desirable, however, to persevere, as it appears probable that a much better type of car is possible, and many advantages to the public would follow success.

I have made experiments with super-compression devices of different kinds, which convince me that it is possible to arrange for the increase of the mean pressure upon the piston at the slower speeds of rotation by about 50 per cent. without increase of maximum explosion pressure. To do this it is necessary not only to increase the charge supply pressure as proposed by Daimler, but also to increase the volume of the compression space. By the simultaneous increase of charge pressure and compression space volume, torque is greatly increased, although, of course, expansion is diminished, and the theoretical economy is somewhat reduced. Such an increase of mean pressure as I have suggested would enable cars of moderate power to dispense almost entirely with change of

The above illustration, which depicts a consignment of Humber Cabs to one of the London cab companies, demonstrates the increasing popularity of this type of vehicle.

speed gear. If the pumping arrangements could be operated by a small separate petrol motor nicely balanced and always running, the main engine could be arranged to act as a compressed air engine only when in traffic or on hills at slow speed. The added engine and pumps increase the complication, but it seems to me possible to reduce total weight by the reduction of main engine dimensions and the simplification of gear-box arrangement. A car which could be stopped and started in traffic without the need of the clutch and could stop on a steep hill in the same way, with the certainty of starting smoothly, would combine the advantage of both steam and petrol engines.

The steam car has taught the petrol vehicle designer many lessons, and a closer possible approximation to the valuable points of extreme flexibility and silence is still desirable, so that the good points of both steam and petrol may be found in the best petrol cars. The latter has the advantage of greater power for a given weight and smaller fuel consumption for equal powers. It is also simpler in construction and more easily kept in running order. It is much more accessible for repair and adjustment. The steam car has the advantage of extreme flexibility and entire control of the engine in traffic, so that it can be started from rest, stopped and made to move very slowly or at speed by merely admitting steam or cutting it off.

The flexibility of a steam engine differs considerably from that of a petrol motor, and a short consideration of what is meant by flexibility may be useful. As a power producer the horse must be considered as a motor of ideal flexibility; the horse can develop his 33,000 foot pounds per minute, either by a small pull exercised through a long distance in the time, or a heavy pull through a short distance. He can either give a light or heavy pull, and develop the same total power either by motion at a higher or lower velocity. The petrol motor cannot do this; within wide limits of speed no substantial variation of mean pressure on the piston follows change from high speed to low speed. Assume a petrol

*Abstract of Presidential Address read on the 14th Inst. at the Incorporated Institution of Automobile Engineers.

engine to be running at 1,000 revolutions per minute under a mean effective pressure of 90 lb. per square inch, developing an indicated power of, say, 40-h.p.; then if the speed be dropped to 500 revolutions per minute, the mean pressure of 90 lb. will remain practically unchanged; if the valves are properly proportioned there will be little change in mean pressure. The engine at half speed will then indicate only 20-h.p. To comply with ideal flexibility, 40-i.h.p. should be developed, and to do this 180 lbs. mean pressure would be required. In the sense of ideal flexibility the petrol motor is conspicuously deficient.

Assume, now, a steam engine of either the simple or compound type, to be supplied from a steam boiler capable of supplying steam at a given pressure and rate. The steam engine may consume the whole of its supply either at a high or low speed; take the same speed variation as supposed in the petrol engine, 1,000 and 500 revolutions per minute. At the high speed, a given point of cut-off will utilize the whole steam supply, and give, say, 40-h.p. at 90 lbs. mean pressure. At the low speed, 500 revolutions, the cut-off must be later to use the whole steam generated, and then the steam weight used per revolution will be doubled; the mean pressure will not be doubled, but it will be greatly increased. Say that it rises from 90 lbs. to 150 lbs. per square inch, then the i.h.p. at half speed will be 33½. The steam engine thus possesses considerable flexibility, although it has not the ideal flexibility assumed to exist in the horse.

True flexibility in a motor requires the property of producing maximum power at both high and low speeds, and this property is to some extent present in the steam engine, and almost absent in the gas or petrol engine. What is commonly called flexibility in a petrol motor is in reality controllability, which is a different thing.

The steam engine could be more closely followed in this matter by supplying the petrol motor with a constant or even an increasing weight of charge as the speed of rotation falls in the manner which I have already suggested. Recent improvements in the petrol engine, such as very large inlet and exhaust valves and very light pistons and moving connections, have made it possible to greatly increase the total power to be obtained from cylinders of given dimensions by permitting of longer strokes and higher speeds of rotation, while keeping up the weight of charge dealt with per stroke.

While even better results may be desired on the two points—clutch connection and true flexibility—another important matter requires persevering attention. I refer to the exhaust products discharged into the air of our streets: the rapidly increasing use of private and public motor-cars in cities raises the study of the carburettor to a position of national importance. It has been clearly proved that the products discharged from an engine when the mixture of petrol and air is properly proportioned is innocuous in its chemical nature; combustion is almost complete; but when proportion is incorrect, and vaporising action imperfect, the products are noxious. Carburettors at present proportion correctly at two or at most three points of load and speed; at intermediate points some deviation occurs. The problem of proportioning accurately and automatically for all speeds and loads is one of difficulty, and existing devices provide an imperfect solution. Methods of carburettor control which depend entirely on engine speed cannot produce accurate results, because the motor may run at the same speed under quite different conditions of throttle opening. What is really required, as I have already pointed out, is some method of controlling depending solely on the charge volume which passes the jet.

ROAD REPORTS.

GODSTONE.—Mr. J. George-Powell, surveyor to the Godstone Rural District Council, who, during the ten years he has been in the district, has paid special attention to the surface of the highways, has been appointed county surveyor of Wiltshire.

HAYWARDS HEATH.—The Urban Council has decided to tar spray, at the commencement of next season, the roads of the district for a length of 4½ miles.

FINCHLEY.—A line of tramways which has just been begun by the Middlesex County Council will run from the Great North Road at Tally Ho Corner by the Finchley road to Cricklewood. The total length is about six miles, and as the main road along which the line will pass is an important avenue for motor traffic out of London, it is now being widened and repaved by the Middlesex County Council.

EAST SUSSEX.—Repairs on the main road between Handcross and Slaugham, Dale Hill and Sayers Common, and Muddleswood and Hurst are being carried out—a fact to be noted by motorists touring in that part of East Sussex.

ILKLEY.—The Ilkley District Council has decided to recommend that the County Council should make application for the limitation of the speed of motor-cars within a mile radius of Brook Street, Ilkley, to eight miles per hour.

SETTLE.—Recently the West Riding of Yorkshire County Council agreed to bear two-thirds of the cost of tarsepaving certain main roads, provided one-third was borne by the local authorities in whose district the roads so treated were situated. One of the district councils coming within the agreement was the Settle Rural, and the payment by them of the one-third cost has been surcharged by the Local Government Board on the ground that tarsepaving does not amount to an improvement within the statutory provisions in that behalf. In view of all the circumstances of the case, the committee have supported the Settle Rural Council's appeal against the surcharge.

CLUBS AND ASSOCIATIONS.

ROYAL.

ARRANGEMENTS are now being made with the Royal Automobile Club of Spain by which the R.A.C. will be in a position to issue Spanish Custom papers to members visiting that country.

By arrangement with Messrs. George Philip and Sons, a special road map of England and Wales is being prepared. The map is to be on the scale of two miles to the inch. It will embody many useful features, and the markings of the roads will be extremely clear. Twenty sheets will complete the map.

THE MOTOR UNION.

THE October meeting of the General Committee of the M.U. will be held on Wednesday next. The clubs which have this year contributed to the Legal and Legislative Defence Fund are as follows:—Wiltshire, North Yorkshire, South Devon, Lincolnshire, South Wales and Monmouth, West Essex, Cheshire, and Cambs. and Isle of Ely. Among the latest individual subscribers is the Earl of Mexborough.

The M.U. has instructed its local solicitor at Birmingham to institute police court proceedings at Oswestry against the driver of a car who is alleged to have struck the wife of a member with a whip while she was riding in a motor-car.

The Union, together with the Lincolnshire A.C., were represented before the Board of Trade by Mr. Moresby White in opposition to the Mid-Lincolnshire Light Railway Order. The amendments will be communicated by the Board to the Light Railway Commissioners for their consideration of future Orders.

Additional appointments as hon. local correspondents of the Union have been made as follows:—Mr. A. G. Chaplin (Hertford); Mr. J. E. Birtless (Stockton Heath); Dr. C. Jephcott (Chester); Dr. L. Hill (Haltwhistle); and Mr. Lawson Turnbull (Aberdeen).

The New Forest Automobile Club and Hants Motor Union, which has a membership of 180, has decided to have a postal ballot on the question of future association with the R.A.C. and the Motor Union.

AUTOMOBILE ASSOCIATION.

THE membership of the Automobile Association on October 1st stood at 7,838, as compared with 4,464 the same day last year, representing an increase in income of over £7,000 per annum.

Early last month publicity was given to the report of a motor tragedy at Albenga, near Genoa. An engineer was said to have shot two occupants of a car that was alleged to have run over his little son. Thanks to investigations made in the district by a correspondent of the A.A., it is now established beyond doubt that the story is an invention. The Mayor of Albenga writes that nothing is known of the matter.

ROADS IMPROVEMENT ASSOCIATION.

IN connection with the dust prevention experiments carried out under the auspices of the Roads Improvement Association, the medals awarded by the Judges' Committee have just been presented:—A gold one to Mr. T. Aitken for his pneumatic tar sprayer; a silver medal to Tarspra, Ltd., for the 700-gallon Tarspra Thornycroft motor-van (being part of the first and second prizes respectively in the competition for the best tar spreading machine); and a gold medal to Messrs. R. S. Clare and Co., Ltd., of Liverpool, for Clare's patent tar compo, this medal being part of the first prize in the competition for the best preparation of tar for road purposes.

AUTO CYCLE UNION.

ON Saturday the Auto Cycle Union held a Council meeting at Leamington, when representatives of more than thirty motor-cycling clubs were present and a scheme for interesting individual members in the work of the Union was discussed. At the dinner in the evening the Mayor of Leamington presided, and the thanks of the Auto Cycle Union for the welcome given by the local authorities to the motor-cyclists were voiced by Mr. F. Straight, the secretary and other speakers.

The quarterly trial (under the A.C.U.'s open competition rules) is being held to-day (Saturday), starting at 9 a.m. from the Chequers Hotel, Uxbridge. The course will be about 125 miles in length, and will extend over a route from Uxbridge, Beaconsfield, High Wycombe, Dashwood Hill, Wheatley, Islip to Banbury, returning via Bicester, Aylesbury, Berkhamsted, Cheam, Amersham, and Beaconsfield to Uxbridge.

MOTOR CYCLE UNION OF IRELAND.

A NUMBER of speed tests under the auspices of the Dublin centre of the Motor Cycle Union of Ireland were held at the Velvet Strand at Portmarnock on Saturday last. Three handicaps figured on the programme and also a match between the members of the Dublin and District Motor Cycle Club. N. E. Drury on a 5½-h.p. twin-cylinder J.A.P. was the scratch man in the open events, but he was asked to give away too much, and both of the events were won by C. B. Franklin, who was riding the 3½-h.p. single-cylindered J.A.P. which he rode in the Tourist

Trophy race in the Isle of Man. In both races he had easy victories. The four miles race for the J. B. Dunlop cup, presented by the president of the Union, was won by R. Walshe, and his second successive victory makes the trophy his own property.

THE CYCLE AND MOTOR TRADES BENEVOLENT FUND.

ON Thursday the third annual banquet of this Fund was held at the Hotel Cecil, London, Mr. Albert Eadie presiding. Originally it was to have taken place in the Victoria Hall, but so large was the number of guests expected that the venue was changed to the Grand Hall of the hotel.

Mr. Frank Shorland presided at the monthly meeting of the Executive Committee for the current month, when the hon. treasurer reported a balance of £525 to the credit of the current account at the bank. Thirteen subscribers and two members were elected and cheques were drawn for the pecuniary relief of six applicants.

SOUTHERN.

THE results of the club hill-climb, which took place on September 26th last, reached us on Monday morning, as follows:—Car class up to 20-h.p., C. J. Newey, 10-h.p. De Dion; Class 3, tri-cars, side-cars and

and others, is having satisfactory results, and is being favourably reported on from various parts of the country. A considerable number of cases are being dealt with.

CASES AGAINST MOTORISTS.

DISMISSALS.

Dr. A. E. Porter, medical officer of health to the Reigate Rural District Council, was alleged at the Reigate Police Court, on Saturday, to have driven his car at over thirty miles an hour. The police were cross-examined as to the correctness of their time-keeping. For the defence it was contended that the speed never exceeded twenty miles an hour. A stipendiary magistrate, who travelled in Dr. Porter's car, said he had never seen a speedometer at work before, and as they drove along the roads he watched it carefully, and it never registered more than twenty miles an hour. The summons was dismissed.

Before Judge Owen at the Cardiff County Court Mr. B. W. de Vires, marine engineer, of Cardiff, summoned Mr. Benjamin J. Dav, electrical engineer, also of Cardiff, for £15 damages claimed by plaintiff and his daughter, who alleged that they had been run down by defendant's motor-car on the Cowbridge road on September 11th. Mr. A. Parsons (instructed by Mr. F. C. Shackell) defended. Defendant's

The International Balloon Races at Berlin.—A view of the balloons preparing for the ascent on Saturday last.

quad-cars, H. F. Harding, 14-h.p. Etna; Class 4, twin-cylinder motor-cycles, E. K. Davies, 5-h.p. Peugeot. The results in the single-cylinder motor-cycle class will be given at a later date.

SCOTTISH.

DURING the last few weeks a considerable number of warning posts and direction posts have been erected by the Scottish A.C. Among others the posts are located in Falkirk, Yoker, Uplawmoor Station, and at various places in Inverness-shire. Notice posts have been located in Lossiemouth, Bathgate, Dumbarton, Haddington, Beattock Summit, and on the Duke of Portland's estate.

In one or two cases the magistrates of police burghs, who have been considering the question of application for restricted speeds within their areas, have been in communication with the Club, and it is anticipated that they will accept warning posts at the entrances to the burghs in lieu of the proposed applications. Several other authorities have agreed to conferences with representatives of the Club before proceeding further with applications for ten mile limits.

The action which the Club are presently taking with regard to inconsiderate driving and excessive speed of cars, and which is involving daily consideration of numerous reports from the Club's special agents

evidence was that he drove very slowly out of the entrance of Highmead, and was positive that his car did not go within ten yards of the complainants. The judge gave judgment for the defendant. "I thank you, sir," said plaintiff as he left the box.

THE VALUE OF THE BADGE.

Some time has been spent on a recent day at Midhurst Petty Sessions in hearing cases against motorists for exceeding the speed limit. Ronald Edmond Maud, of Coventry, was summoned for exceeding the speed limit at Rogate, on September 12th, but did not appear. The Chairman of the Bench said he had received a rather remarkable letter from the defendant, who pleaded guilty. He stated that it was very unfortunate, as he had taken his A.A. badge off. Otherwise he would have been warned by a scout at the commencement of the "trap." A fine of 40s. and costs was imposed.

WITHDRAWAL OF A WARRANT.

The warrant issued at Oxford on Tuesday week for the arrest of the Earl of Berkeley in connection with a summons under the Motor Car Act has been withdrawn.

ACCIDENTAL DEATH.

In the Westminster Coroner's Court on Saturday, Mr. R. Henslowe Wellington concluded his inquiry concerning the death of James Talbot,

who was knocked down and fatally injured by a motor-car in Whitehall on September 30th. Mr. John Heeketh Pearson, a motor engineer, of King's Road, Brighton, has been remanded on bail from Bow Street Police Court in connection with the matter. Eye-witnesses of the accident gave varying estimates of the speed of the car. Mr. Pearson said that he was driving down Whitehall, going at about the same speed as the horse-drawn vehicles. Talbot crossed the road and took no notice of the siren. The witness let the clutch out and turned slightly to the right, thus missing him, but the back of the car caught him, through the motor skidding badly. The jury returned a verdict of accidental death.

EXCEEDING LEGAL LIMIT.

Lord Robert Innes-Ker was fined £5 and costs at Richmond on Monday for driving a motor-car above the legal limit along the Sheen road. At Epsom on the same day Mr. D'Arcy Baker was fined £25 and £1 3s. costs for exceeding the legal limit and for failing to produce his licence when demanded at Banstead on September 20th.

BATCHES.

Several cases against motorists have recently been heard at Wimbledon (4), Tadcaster (3), Rugby (10), Midhurst (6), Selby (8), Croyden (5), Newcastle-on-Tyne (5), Feigate (3), Bromley, Harrogate, Dundee.

THE "DANGER" SPEED AT NEWMARKET.

At Newmarket, on Tuesday, C. A. Branteen, a Cambridge undergraduate, was fined £10 and costs and his licence suspended for three months. He was charged with driving a motor-car at a speed which, considering the local circumstances, was regarded as dangerous to the public, on August 3rd, and also for failing to stop when requested by the Hon. George Lambton. In the first case Mr. Lambton estimated the speed at five or six miles an hour. He withdrew the second summons.

COMMITTED FOR TRIAL.

At Kingston, on Tuesday, Edward Bowring Toms, of North Haven Point, Parkstone, Dorset, appeared, on remand, charged with wantonly and furiously driving a motor-car on the Portsmouth Road, Long Ditton, on September 3rd, and knocking down Alfred Berry, a Surbiton carman, 22 years of age, thereby causing him grievous bodily harm. The Chairman (Mr. W. Y. Cockburn) said the Bench thought that it was a case that ought to go to a jury, and the defendant was committed for trial at the ensuing Surrey Quarter Sessions. Bail was accepted in £100 and one surety in a like amount.

PUBLIC SERVICES.

APPLICATION for the licence of a motor-taxicab has been refused by the Corporation of Dublin.

A SERVICE of motor-taxicabs is about to be established for Edinburgh, Aberdeen, and other towns in Scotland, by the Caledonian Motor Company, Ltd., which has acquired the business of the Caledonian Motor-car and Cycle Company, Ltd., of Aberdeen.

CONSIDERABLE interest was taken in Hull one day last week by the appearance of the first motor-taxicab that has been seen in the streets of the Eastern seaport.

THE Watch Committee of the Hove Town Council have asked the London Electrobuses Company to renew their application for the licensing of six electrobuses in three months, in order that the local company may be able to introduce other than petrol-buses in the meantime.

BOTH at Brighton and London considerable disaffection has been voiced during the last few days among some of the motor cabmen.

AUTOMOBILE ACCIDENTS.

IN driving home in his motor-car, after paying a visit to Westerham on Sunday afternoon, Sir W. Hart Dyke met with an accident, his car coming into collision at Polhill, Sevenoaks, with another car belonging to a gentleman at Sidcup. The occupants of both vehicles were thrown into the roadway, the driver of the Sidcup car having his leg fractured. With the exception of a severe shaking and some bruises, Sir William Hart Dyke was uninjured.

A MOTOR-CAR accident occurred on the London road, about twelve miles from King's Lynn, on Saturday night. In rounding a bend the vehicle struck a gatepost, and was wrecked. The chauffeur, named Willis, was precipitated through the glass screen. His injuries were dressed at the West Norfolk and Lynn Hospital, whither he was conveyed.

ON Monday afternoon Mr. J. L. Perrin, of Bristol, was struck by a motor-car while cycling on Clifton Downs and killed instantaneously.

AT Mortlake Coroner's Court on Tuesday, Dr. Taylor resumed the inquiry into the death of George Charles, a chauffeur, who was killed in a collision near Barnes Common railway bridge. At the time of the accident he was driving his employer, Mr. Alfred Rawlinson, the managing director of the Darracq Company, who was returning from London in a motor-brougham. The circumstances have previously been reported and the jury returned a verdict of "Accidental death," exonerating the driver of the motor-bus. They added a rider that, considering the increase in the number of accidents caused by motor-driving within twelve miles of Charing Cross, the speed of motor-vehicles should be reduced to twelve miles an hour, and that a copy of this rider should be sent to the Local Government Board and the Home Secretary. They recommend that the District Council should widen the narrow road in which this accident occurred.

FORTHCOMING EVENTS.

OCTOBER.

- 17th (Sat.).—Auto Cycle Union quarterly trial—Uxbridge, to Pantbury and back.
- 24th (Sat.).—Motor Parade and Gymkhana of the Blackpool and Fylde District M.C. at the Agricultural Show Ground, Blackpool.
- 24th (Sat.).—Conference of provincial clubs at Birmingham to consider the question of affiliation with the central motoring organizations.

NOVEMBER.

- 6th (F.).—Invitation Smoking Concert of the Stanley Cycling Club at the Queen's Hall, London, W.
- 13th-21st.—Olympia Motor Show, London.
- 14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club Hotel Metropole, London, S. W.
- 18th (Wed.).—Annual Dinner of the Motor Union.
- 20th-28th.—Stanley Show at the Royal Agricultural Hall, London, N.
- 26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.
- 28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

- 23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.
- JANUARY, 1909.
- 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
- 26th.—Scottish Motor Trade Association Dinner at Edinburgh.

LIGHTING-UP TIMES—LONDON.

| | | | |
|---------------|-----------|-----------|-----------|
| Oct. 17th—6.2 | 19th—5.58 | 21st—5.54 | 23rd—5.50 |
| " 18th—6.0 | 20th—5.56 | 22nd—5.52 | 24th—5.48 |

To find the approximate lighting-up time in October for Birmingham 6 minutes should be added to the above times, 2 for York, 8 for Manchester, and 14 for Glasgow.

POLICE "CONTROLS."

A TRAP at Fryston Park Corner, near Selby, is in frequent operation, as is also that at Long Marston, near Tadcaster.

AT Bramham, near Wetherby, is a motor-trap, in which several strangers have lately been caught.

MOTORISTS are being timed over a measured quarter of a mile at Compass, Launceston.

POLICE-TRAPS are a familiar feature of the landscape at Trumpington, near Cambridge.

THERE is a police trap—profitable to the county—at Rayleigh, in Essex.

THE Stretford (near Manchester) District Council has drawn the attention of the local police to the speed at which motor vehicles are driven through their district.

BUSINESS NEWS.

THE LOW ACCESSORIES AND IGNITION COMPANY, LTD., has been registered with a capital of £500.

MR. J. SMALLWOOD, of the Salisbury Garage, Friary Lane, Salisbury, has bought a 26-h.p. Metallurgique with which he proposes to give trial runs to intending purchasers in his neighbourhood.

MR. J. KEELE writes us from 72, New Bond Street, W., stating that he has converted his business into a private limited company under the title of J. Keele, Ltd., with a capital of £10,000. Mr. Keele has been appointed as managing director of the new company.

A MILITARY gentleman has written to Mors, Ltd., stating that he has now driven his 17-h.p. Mors car over 15,000 miles. He has just had the engine overhauled and reports that there is not the slightest sign of any shake in the bearings.

HUMBER, LTD., give notice that as from the 5th inst. their registered address is Stoke, Coventry. We understand that the removal from Beeston is now complete, and that Mr. T. C. Pullinger has joined Mr. W. Phillips in the management of the new works erected in Coventry, and has taken with him the principal heads of departments and some hundreds of the most highly skilled mechanics who have assisted in making the Beeston productions so celebrated throughout the world.

THE business of the late Motor Delivery Company, Ltd., has been purchased from the liquidators by Messrs. Pickfords, Ltd., and will in future be carried on under the style of the Motor Contract Company, the office being at 143, Strand, W.C. The company is prepared to enter into contracts for the supply and maintenance of motor vehicles by the year or other periods, as may be agreed, relieving the hirers from all capital outlay and from worry and responsibility in connection with the running of automobiles in their service. The principal work undertaken by the company at present is the supply on contract of travellers' broughams and light delivery vans, a recent contract of interest being entered into with Mudie's Select Library for the delivery of books to their customers within a radius of thirty or forty miles of the London area.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, OCTOBER 24, 1908.

[No. 503.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE annual protests against the presence of automobiles at the Hunt with which we have been favoured for many years have not come to hand this season. Horses as well as the huntsmen have become accustomed to the motor-car, and while motorists continue to observe caution when driving near the scene of the Meet protests are not likely to come along. It is recognised that the social pleasures of the hunt are enhanced by the presence of the motor-car, and covered vehicles as well as open cars are now frequently seen near the leading meets of the country. In fact, their presence scarcely causes comment nowadays.

A "Short" Trap.

ALTHOUGH in the south of England it is regarded as an act of treachery to doubt the words of the police or to suggest that they cannot always measure accurately, the fact has been proved in Perthshire that some police traps which have been reported as a mile in length have been considerably short of that distance. According to a correspondent in the "Glasgow Evening Times" it has been ascertained that several of the "miles" in the Highland district of Perthshire used by the police as traps have been found to be considerably under an actual mile. A local chauffeur, recently reported for exceeding the speed limit on the mile between Newton of Logierait and Knockintober, warned the police that the mile chosen for their trap was a short one, as he had implicit confidence in the accuracy of his speedometer. Before proceeding further the mile in question was specially measured by the Highland district road surveyor, and it was found on chain measurement to be 218 yards short, which cancelled cases against several motorists timed on this stretch.

The Roadway of the Future.

Now that the British delegates are returning from the Road Congress in Paris, their impressions are getting abroad. From one of the leading surveyors in Scotland we learn that the general view as to tar being the only substance likely to lead to a mitigation of the dust nuisance is in accordance with the experience north of the Tweed. The best results are obtained in Scotland by incorporating the tar into the structure of the roadway. Mr. R. Drummond, who is the president of the Road Surveyors' Association of Scotland, was accompanied by Mr. A. Stevenson, and submitted to the Congress a useful analysis of what is being done in his country, as well as his views as to the future. With regard to the latter point, he said the road of the future must be at least sixty feet wide (carriageway forty feet and two ten feet footpaths). The foundation must be strong and composed of concrete or equally hard material. The drainage must be carefully attended to. The surface hard and absolutely uniform in camber, at curves the road where possible to be banked on the outside to reduce the risk of accidents to a minimum. It was impracticable to construct special tracks on account of the diverse conditions of traffic. In certain localities, where the population is small,

special tracks might be formed, but the expense of such tracks would be a serious impediment to their adoption. In this country it has been found on roads carrying heavy traffic, particularly in winter, the only solution of the difficulty is to pave the road with hard setts on a concrete foundation. The construction of a road to give a surface sufficient to stand the combined wear and tear of the modern self-propelled machine with that of the horse-drawn vehicle should have a finished surface hard enough or tough enough to withstand the suction of the rubber tyre and the grinding action of the iron-shod one. In the case of the heavy motor or steam tractor, the question of the size of the wheels plays an important part in the damage caused to the roads. We are glad to find a road surveyor recognising, instead of denouncing, motor traffic.

A National Question.

At the Congress one of the most useful papers—from the point of view of those who recognise that the subject is too vast to be dealt with in piecemeal fashion—was that of Mr. Ballin Hinde, whose associations with the Motor Union as well as with the Midland Club are well known. After showing the anomalies that arise from the present want of system and neglect of uniformity, he went on to refer to present inequalities, of which a trio may be given here: (1) At present the roads of a district are probably most used by non-residents, who "wear" the surfaces but do not contribute towards the up-keep. (2) Experiments cannot be undertaken, even by a county authority, with any sense of financial equity to the ratepayer. (3) Owing to the absence of suitable road-making materials in many districts, the cost of constructing highways varies to a great degree. Many authorities have declared in favour of a national State Department; but Mr. Hinde has rendered the further service of planning out a scheme of work which should be helpful in showing to the Government the need for such an innovation.

A Sevenfold Plan of Work.

THE sevenfold nature of the work to be done is thus set forth by the vice-president of the Motor Union: "(a) The establishment of a bureau of information concerning the practice of other countries with regard to the construction of roads; (b) The collection of data with reference to new road material, the compilation of records as to the behaviour of various types of road, and the classification of material in order of utility for special conditions; (c) The organisation of a department for providing machinery and equipment for districts where—as in Ireland—steam rolling and other modern methods have had to be disregarded on the score of expense; (d) Working in conjunction with the Ordnance Survey a road plan of the country should be prepared, with the view of straightening roads that at present are tediously zigzag in form, securing short distances instead of roundabout courses between important towns, and advising with regard to proposed new roads and highways; (e) Undertake the maintenance of all main roads, and so secure a desired uniformity in surface and construction; (f) The encouragement of experiments likely to serve the national purpose; (g) A general liberty of action.

with regard to subjects coming within the category of roads." This programme can scarcely be improved upon, and Mr. Ballin Hinde's proposals for the work to be undertaken by the State Department will doubtless prove the basis of any draft that may be submitted to Parliament.

The Valveless Engine.

ELSEWHERE we conclude the paper which Mr. C. Y. Knight read last week on the engine which has attracted much attention since its adoption by the Daimler Company was notified. Mr. Dugald Clerk was able to give his personal testimony that the engine was very much quieter than any ordinary petrol motor, whilst the car pulled wonderfully well at a very slow speed. Mr. G. H. Baillie, Mr. J. S. Critchley, Dr. Hele-Shaw, Mr. William Watson and others have already expressed their views, and in our next issue we shall be able to give the opinions of other experts with regard to this innovation. Mr. Knight is extremely desirous that his new departure in motor engineering should be fully discussed, and doubtless some of our readers may take advantage of the Correspondence columns to set forth their views.

Shipping a Motor-Car at Brest.

The new cross Channel route recently inaugurated between Plymouth and Brest by the Great Western Railway Company brings another very interesting part of France within reach of touring motorists. At both the ports named excellent arrangements have been made for quickly getting cars on to the steamer.

The King's Highway.

FROM the St. Bride's Press, Ltd., comes a work on the "King's Highway," by Mr. Reginald Ryves, who is in the Public Works Department of the Madras Presidency. In the course of a score of concisely written chapters, he refers to the want of uniformity in British road maintenance as compared with the system that prevails in most of the countries of the continent. Then follows a chapter on the widths of roads, and some diagrams showing how the system of "eased corners" might mitigate the dangers of the cross roads as we know them in England and Wales. The work also deals with the various materials used in road construction, and an effective chapter is given as to the effects of trees on roads, in which the mitigation of the dust nuisance by the help of forestry is urged. One or two photographs illustrate how trees may afford a valuable kind of protection to the surface of the highway, and by helping to keep the roads dry prevent that disintegration which occurs during frosty weather. Mr. Ryves points out that the most obvious virtue of trees is that they retard the development of dust in summer, and declares that it is wrong to allege that

they make roads damp, and must, therefore, be regarded as enemies to be kept back as far as possible. The point is one which has not been closely followed as yet, and the way in which Mr. Ryves introduces the subject should lead to its consideration by experts in this country.

The Benevolent Fund.

AT the third annual dinner of the Cycle and Motor Trades Benevolent Fund, a large representation of the motor industry gave the hope that ere long there may be that financial response from the motor trade which the chairman asked to place the fund on an impregnable financial basis. More than £900 has been raised as a result of the appeal by the chairman, Mr. Albert Eadie, and the Hon. Sec., Mr. A. J. Wilson. The fund is open to all associated with the motor trade, and has already proved its helpfulness in time of need. It is the only benevolent organisation in the industry, is not confined to any section or locality, and we would urge its claims upon all our readers concerned with the business side of motoring. *Bis dat qui cito dat.*

Tar and Horses.

SOME of the drivers of horse vehicles on those roads of Sussex which have been treated with tar are complaining that those thoroughfares are now in a condition of slipperiness which is dangerous for horses. The long spell of summer weather which has been enjoyed this year has solidified the tarred roads to a great degree of hardness. When a slight frost or moisture settles upon the surface it is said that a condition of greasiness is produced which is most dangerous to horse traffic. Some of the local authorities are suggesting that under such conditions these should be covered with grit or sand, as is the case with the streets of London.

A Census of Accidents.

SEVERAL M.P.s, notably Sir Francis Channing and Mr. Mackarness, have been questioning the Prime Minister with regard to the injury to life and property caused by alleged abuses of motor traffic. Replying to several questions, Mr. Asquith has referred M.P.s to the recent circular of the Local Government Board, and assured them that should this not lead to a more systematic enforcement of the law further action may be considered. In this connection we may mention that the Home Office has instructed the police throughout the country to prepare a census of the number of accidents in which motor-cars are concerned from May last to December in the present year. This will probably influence for good or ill the course of motor-car legislation during the coming year or two, and individuals should do what they can to secure that the figures are not raised beyond the normal rate by disregard of the ordinary courtesies of the road.

No Confidence.

AT the last meeting of the Guildford Rural District Council complaints were received from the parishes of Send and Ripley to the effect that nothing had been done by the County Council in regard to the application for a ten mile speed limit for motor-cars passing through Ripley. A member of the County Council who was present said that there were 150 similar cases before that body, which had selected ten which they regarded as the most urgent to report to the Local Government Board with a view to enquiries being made. Ultimately it was resolved to request the Parish Councils of the two villages concerned to forward their application direct to the authorities at Whitehall, "the District Council having no confidence in any action the County Council may take." Unluckily for the success of the move the Act distinctly says that the County Council will be the recommending medium, and the Local Government Board

is not likely to attempt to override either the Act of Parliament or the province of the County Council.

Irish Ways.

THINGS are very different in Ireland to what they are in this country, judging from two impressions which have recently been given us. Lecturing at the Exhibition of the Royal Photographic Society, Mr. Arthur Marshall has been saying that the chief troubles to motorists arise from the fowls which fly alongside the car, the ducks which squat down on the roadway in order that vehicles shall pass over them, and the pigs which lie in the centre of the highway and refuse to budge. The only way, according to Mr. Marshall, to deal with the latter is to turn the car round and let the exhaust waft them out of harm's way. There are, however, legal compensations for the motorist which, perhaps, amply make up for any trouble which he is caused by the

the offence was committed. This is an interesting legal point, which perhaps may be useful knowledge to some of our readers in the Emerald Isle.

Teaching the Young.

SOME lads who have been amusing themselves by placing on the road at Tarring "certain sharp substances, to wit, nails, in such a position as to be likely to cause damage to property," have been admonished by the Worthing Bench, whilst we trust parental discipline will in future deter them from a repetition of their recent escapade. They had taken some nails from a building and placed them on the roadway at regular intervals, with the points upwards, over a space of eight or nine feet of the roadway. Then when a motor-car came "something went off bang," and the lads made away as quickly as possible. A constable who gave evidence had collected two packets of nails

The B.A.C. Dust Trials.

The B.A.C. have sent us a series of photos taken on the occasion of the recent Dust Trials on Brooklands Track. Three of the pictures are reproduced above. The upper one depicts the 22.5-h.p. Buick car, entered by Mr. F. Eason, travelling at a speed of twenty miles per hour; this vehicle secured the first prize in the Makers' Section. The lower illustration on the left shows Mr. H. Gordon Sharp's 18.06-h.p. Reo (second prize) covering the dust-covered portion at thirty miles per hour. The third photo, which is given by way of comparison, shows the cloud raised by one of the worst dust-raising cars in the test.

natural obstinacy of the porcine monsters which frequent Irish roadways. A K.C. of the Irish Bar sends us an interesting example of the humour of the situation so far as the prosecution of motorists as well as of other persons is concerned. If a person commits any offence punishable under the Summary Jurisdiction Acts, the only persons who can try the case are the justices of the Petty Sessions of the county in which the offence has taken place. These, however, can only issue, and have served, a summons upon a defendant residing in their county, or in that immediately adjoining. Thus if an offence be committed at Bray, in Co. Wicklow, the case must be heard at Bray. Should the offender live either in Co. Dublin, Co. Wicklow, or Co. Wexford, he could be brought to justice because he lives either in the county where the justices deciding the summons have jurisdiction or in an adjoining one. Should, however, he live in another district or in England, he can scarcely be made amenable for the case, for it would be impossible, practically speaking, to serve him with a summons in that county where

from the road, and we trust the police will be as keen after such delinquents as they are with those who indulge in less reprehensible practices.

Mr. R. W. COAN has lately extended his well-known aluminium foundry in the Goswell Road, London, E.C., while a site for future development has also been acquired.

THE British military aeroplane was taken out by Mr. S. F. Cody, who is mainly responsible for its construction, and met with an accident at Farnborough on Friday last week. The machine succeeded in leaving the ground, but, in endeavouring to avoid some trees, Mr. Cody turned the aeroplane too sharply, with the result that the left wing went up and the right dipped down, and after fluttering a few moments in the air the apparatus fell to the ground, hopelessly smashing one wing and breaking the other in half. Mr. Cody, who stuck to his seat, was unhurt, while the engine, a 50-h.p. eight-cylinder Antoinette, was but slightly damaged.

MOTORIZING IN WINTER. SOME SEASONABLE TIPS.

THE season of cold weather being again at hand, it is opportune to recall to the minds of motorists the special difficulties which attend motoring during this period of the year, and the precautions necessary. A good deal of damage is done to cars in the winter months, when a sudden frost may be experienced with but little warning, owing to neglect of these precautions; and perhaps mishaps may be prevented by giving a timely hint, especially to novices.

Should a frost occur, and the car is housed in a cold stable, the cooling water will freeze in the jacket, the pipes and the radiator, if it has not previously been emptied out, and, as water expands in freezing, it will probably crack or burst these. The damage is particularly heavy if a cylinder is affected. Either the jacket wall or the cylinder wall may be cracked; if the former, there are a number of methods—some chemical, some mechanical—by which the damage may be repaired; but if the latter, a repair is almost impossible, and the whole cylinder or cylinders must be renewed. In order to prevent

such an occurrence, the addition of some anti-freezing compound to the cooling water should be resorted to. An efficient method is to add glycerine in the proportion of about one part to every five of water. Calcium chloride is also a good specific against freezing, and by many is thought to be superior to glycerine. Probably the chloride of calcium will cause the water to withstand a somewhat lower temperature without freezing, but if it is impure it may cause corrosion in the water tanks or piping. It should, therefore, be obtained as chemically pure as possible. Various suggestions have been made to neutralize the presence of any acid in commercial chloride of

calcium by the addition of some suitable alkali, such as potash, soda, or lime. Whether their effect would in time be detrimental in any way to the circulating system we are not prepared to say definitely, but it is reasonable to state that they counteract the action of any acids present, and probably without deleterious effects. A good solution density is obtained by using 5 pounds of hydrated calcium chloride crystals to 1 gallon of water. This solution will not freeze above zero Fahrenheit. A proportion of 8 pounds to the gallon is recommended by one authority, but in most cases the weaker solution is preferable, as there is less danger of too much water being allowed to evaporate and of trouble caused by crystals forming in the pipes and preventing circulation. Fresh water should be added frequently to keep the system filled and the solution at its normal density.

If no non-freezing compound is employed the only alternative is to carefully empty the cooling water out of the system before locking up the car. If this is the method resorted to it is not sufficient—especially with the older types of cars—to open the drain cock and trust to luck that all the water will drain out, as many cars have been built in which there are pockets in the cooling system which cannot be perfectly drained. The circuit should therefore be carefully inspected to see whether all the

water can flow to the drain opening, otherwise the pipes must be taken off. Pockets are particularly liable to occur in the pump, with the result that the latter will freeze tight, and some part of it will be broken when it is next attempted to start the motor. It is therefore well before starting an engine after a period of considerable cold to ascertain whether the pump is free, by turning it by hand, if this can be done. A burst is a burst, and it will sometimes cost just as much to repair the ravages of one caused by imperfect draining of the water receptacles as one due to the neglect to take any precautions whatever. As long as a car is kept in commission through the winter it ought to be looked after properly; and there can be but one way of thinking about the matter of freezing—i.e., that an ounce of prevention is worth a pound of cure.

Other cold weather difficulties relate to the lubrication and to the carburation. Oil thickens greatly in cold weather, and will not flow readily, if it flows at all, through the feed pipes. In many modern cars the oil reservoir is so located that it is heated by the engine, and after a short period of running feeds at the same rate as in summer. Where this is not the case the lubricating oil may be thinned down with paraffin to the same

consistency as it has in warm weather. A somewhat lighter grade of oil may also be used in winter. Making this change in oil affords an excellent opportunity of giving the motor a thorough flushing out with paraffin, taking particular care that the oil feeds are well cleared, so that there will be no obstruction to the flow of the thin oil by the residue of the same lubricant.

More flooding of the carburettor is apt to be required in starting in cold than in warm weather, but this should not be carried to excess. If the mixture is over-rich it will be necessary to work off the surplus by turning the starting handle until the mixture is reduced to an explosive quality. Another cold

The F.N. Car used in the recent Dutch Military Manœuvres for the rapid conveyance of officers.

weather hint is to drain the petrol from the carburettor if it has been standing for some time, as it is apt to become "stale" and make starting difficult.

Tyres suffer severely if driven carelessly over rough, frozen roads. If there is snow on the roads it is wise to be provided with something to give the tyres a grip on slippery surfaces. If no regular anti-skidding device is fitted, it is a simple matter to keep in the tool box a supply of small chain to wrap round the tyres in case of necessity. There are, however, a number of anti-skidding attachments on the market that do not injure the tyres, and will effectually prevent slipping, while they save time and annoyance to the driver if the car is to be used extensively in the winter.

A NEW form of crime is stated to be at present receiving the attention of the Paris police. Within the last ten days no fewer than twenty-seven motor-cars—in nearly every case vehicles of expensive make and luxurious upholstery—have been seriously damaged by corrosive acids poured or thrown over them by unknown persons in the Opera Quarter, ruining the paint and seriously injuring the leather work and the tyres. The liquid appears to have been thrown from a window, but so far the police have been unable to discover the perpetrators of the outrage.

Some Novelties at the Coming Paris Salon.

BY OUR PARIS CORRESPONDENT.

ALTHOUGH the time has gone when the Paris Salon de l'Automobile might be expected to contain inventions calculated to revolutionise the motor industry, the eleventh annual show, which will open its doors in the Grand Palais in the Champs Elysées on November 28th, will offer more than usual interest. The exhibition, which will remain open till December 13th, will be followed in the same building from December 24th to 30th by the display of machinery, heavy industrial and commercial vehicles, &c., which has till now been contained in the annexe installed last year on the Esplanade des Invalides. It was impossible to utilise that space this year on account of the works connected with the construction of the Metropolitan Railway; moreover, the exhibitors, and especially those showing articles connected with navigation, aerostation and aviation, pleaded hard for admission into the Grand Palais. Relegated to the annexe, they considered they were not given a fair chance to interest the public, who could not be induced to cross the bridge leading to the Place des Invalides.

And it is incontestable that Classes 20 (navigation) and 21 (aerostation and aviation) should attract universal attention. Indeed, if the automobile manufacturers have only most useful and important improvements to present to the public this year, the others will contain revolutionising novelties. In the navigation class will be found, among other things, the Diésel and other internal combustion motors, with which such remarkable achievements have been made recently that the A.C.F. has thought right to organise a special technical commission to study the whole question of navigation while the Salon remains open. The Diésel motor has already been adopted by the French Government for some of its submarine craft. One of the little vessels fitted with it made the extraordinary voyage from Cherbourg to Brest, then back to Cherbourg, on to Dunkirk and back to Cherbourg. As is fairly generally known, very powerful motors of that system are now constructed, some developing as much as 6,000-h.p. The importance of this fact is very great, as it may lead to the adoption of internal combustion motors not only for the mercantile fleet but by the Navy.

However, "A tout seigneur tout honneur." Therefore, before speaking of the light motors and new aviation industry, I will indicate some of the novelties which will be exhibited by the leading French motor manufacturers. Messrs. Panhard's great innovation is their 8-h.p. two-cylinder live axle chassis to be sold at £240; it is destined to compete with the Renault taxi-cab chassis. Another new model to be shown by Panhard is a 30-h.p. six-cylinder chain driven chassis, price £660. This firm has just reduced the price of its 15-h.p. chassis from £460 to £440, its 25-h.p. from £600 to £560, and its 35-h.p. from £720 to £680. Having purchased the patent rights of the Henriot change-speed gear, Messrs. Panhard have been experimenting and testing it in every way with the intention of applying it to all their models, old and new. It had been expected that some of the chassis exhibited in the Salon would be furnished with this new change-speed gear, but I am now informed that the firm have abandoned the idea of showing it, as they have not yet had sufficient time to test it sufficiently to enable them to decide definitely whether they will adopt it for their chassis or not.

Messrs. Renault have established light models with the respective horse-power of 35-45-h.p. and 20-30-h.p. These chassis are of their normal type, but with all the parts lightened and with a special change-speed gear and a more inclined steering wheel. The speed is thus increased, while the wear and tear of the tyres is diminished. This firm will also exhibit a new voiturette; the engine has two cylinders with a bore of 75 mm., and a stroke of 120 mm. and is fitted with magneto ignition. The car has a

double bucket seat, and is built to stand rough work with small expense of petrol and tyres; its price is fixed at £200. The 50-60-h.p. six-cylinder chassis, costing about £1,000, will also be shown at the Salon, and deserves attention, as it is as perfect as it can be made. Messrs. Renault have created another new type of chassis, a four-cylinder 12-16-h.p., but I am not sure whether it will be included in their exhibit in the Grand Palais. Its price has not yet been definitively fixed; but it will be about £400 or £420. The Delaunay-Belleville Company will exhibit one new model, a 30-h.p. six-cylinder live axle chassis. It is most silent and well suspended and will cost £700.

Messrs. De Dion-Bouton and Co.'s show will be very interesting. It will comprise a reliable single-cylinder car with all the latest improvements, costing, with two seats, £180 and with four seats £198. The chassis is the same as that adopted for the new taxi-cabs plying in Paris for hire at the tariff of the horse-drawn vehicles. The motor is rated at 9-h.p. This firm has abandoned the two-cylinder motor, and its smallest four-cylinder engine is a 10-h.p. with the cylinders all in one casting. Other four-cylinder models comprise the 12-h.p., 18-h.p., 25-h.p. and 30-h.p. types. The new chassis manufactured by Messrs. Mors and Co. for 1909, and to be exhibited at the Salon, are a 12-h.p. four-cylinder (80 mm. bore and 120 mm. stroke) with four speeds and live axle, a 17-h.p. four-cylinder (95 mm. bore and 130 mm. stroke), with four-speeds and live axle, a 28-h.p. four-cylinder (114 mm. bore and 150 mm. stroke), four-speeds, chain drive, and a 50-h.p. six-cylinder (114 mm. bore and 150 mm. stroke), with high and low tension ignition, four speeds, chain drive, &c. I regret to be unable to state the prices of these chassis, but Mors told me they were not yet definitively fixed. Messrs. Darracq and Co. will have two new models in the Salon, a 12-14-h.p. and a 20-24-h.p., both with four-cylinder engines. The improvements introduced into these cars, and indeed into all the vehicles to be manufactured by them in 1909, will comprise the gate change-speed lever placed on the side, the adoption of a change-speed gear (four speeds) by three *trains balladeurs*, grasshopper springs, and mechanical lubrication. This firm has considerably reduced its prices. The new 12-14-h.p. costs from £232 to £276 and the new 20-24-h.p. from £370 to £418, according to the length of the chassis and the body. The Motobloc Company will exhibit two new chassis in addition to their existing models, which will also be found to have been improved for 1909. One of the new types is a 9-h.p. single-cylinder, the other a 12-h.p. with a four-cylinder engine. Both have three speeds and reverse, and live axle. The prices are, for the 9-h.p. £132, and the 12-h.p. £312.

Messrs. Clement and Co. will show a new 12-h.p. car, having a four-cylinder engine with a bore of 80 mm. and a stroke of 110 mm. The car will be supplied either as a two or four-seater, and will be very cheap. The price, however, will not be announced till the opening of the Salon. Messrs. Clement and Co.'s stand in the Grand Palais will contain the four following models: 30-h.p. six-cylinder, chain-drive; 24-h.p. four-cylinder, chain-drive; 16-h.p. four-cylinder, live axle; 12-h.p. four-cylinder, live axle.

As for the light motors for aerostation and aviation, their number is increasing every day. Among those which will be exhibited in the Salon is, of course, the Antoinette, which enabled the first aeroplanes to leave the earth. The Renault air-cooled motor, which figured in last year's Salon, will be shown again in its improved form. It has eight cylinders, giving 45-h.p., and now works with most perfect regularity. It is not yet certain, but I have been informed that Wilbur Wright's aeroplane with its motor will be exhibited. The Wright Brothers' motor is of 24-h.p., the four cylinders having a bore of 100 mm. and a stroke of 95 mm. With the flywheel it weighs 90 kilos., whereas the 50-h.p. Antoinette weighs 190 kilos. The aeroplanes which

the brothers Voisin have constructed for Messrs. Goupy, Moore-Brabazon, Florio, and de Caters are furnished with either the Antoinette, the Vivinus, or the Metallurgique motor. They all three give about 50-h.p. at 1,000 revolutions per minute, while their weight varies between 160 and 190 kilos. The Gobron motor, which weighs 130 kilos., and gives 50-h.p. at 1,000 revolutions per minute and 60-h.p. at 1,200 revolutions per minute, will be examined with keen interest by all aviators who may visit the Salon. It comprises eight cylinders placed in the form of a cross with two cylinders on each branch. The explosions take place between two pistons. This disposition, which is one of the characteristics of the ordinary Gobron motor, is claimed to suppress the strain on the cylinders and diminishes the speed of the pistons. The ignition is effected by two magnetos, so that in the case of one failing the other still furnishes the spark to half the cylinders and so would enable the aviator using the motor to descend safely. The Robert Esnault Pelterie (R.E.P.) engine has been often described and will surely attract much attention at the Salon. There will

The Salon will, of course, contain various aeroplanes and models of flying machines. Perhaps the most important display will be that of Messrs. Voisin Frères. There will be at least a model of Henry Farman's aeroplane, which is known to the world, and almost certainly another flying apparatus belonging to the same aviator and built by Voisins. It has been named the Flying Fish on account of its similarity with that inhabitant of the ocean; it is a monoplane with a series of short wings attached to a long frame. This aeroplane, weighing about 600 kilos., measures 14 metres long and has a bearing surface of 24 square metres. It is expected to realise a speed of between 85 and 90 kilometres an hour. The Voisin Frères will also show the triplanes or the models of the triplanes they have constructed for Messrs. Goupy, Moore-Brabazon, Florio, and De Caters. Delagrangé, having formed a company for the popularisation of aviation, will have a separate stand in the Grand Palais, though till now his machines have been built by the Voisin firm. Visitors will also have the opportunity to inspect

The International Road Congress.—Some of the members leaving the Place de la Concorde, Paris, for the trip to Versailles.

be various other light motors for aeroplanes exhibited in a more or less finished or unfinished condition, but the light motor being made by M. Mors, who never shows an imperfect apparatus, will not be exhibited, though that celebrated engineer assures me he will be able to commence delivery of them in February or March next. The motor, which is very light and air-cooled, gives between 60 and 70-h.p., and has the particularity of the cylinders rotating round a fixed shaft. One of the difficulties M. Mors had to contend with was the lubrication of the cylinders, as the centrifugal force of the extremely rapid rotation tended to throw off the oil. The company manufacturing the well-known Gnome motor will show a very light engine constructed on much the same principle as that of M. Mors. It is destined for use on aeroplanes, and weighs only 60 kilos., though it is said to give 50-h.p. at 1,100 revs. a minute. It is air-cooled, and, like the Mors motor, the seven cylinders in a star rotate round a fixed shaft, thus forming a flywheel. It has on several occasions been kept running more than an hour. There is no vibration, and the lubrication seems perfect. The ignition is effected by accumulators.

either the machines themselves or the models of various other aeroplanes, and amongst them those of Messrs. Bleriot, Antoinette, Pischhoff, Robert Esnault Pelterie, &c.

THE Oxford City Council has decided to apply to the L.G.B. for a speed limit of ten miles an hour for motor-cars. One motorist on the council admitted that he was once in favour of a speed limit, but after he had acquired a motor-car, "and came thoroughly to understand how quickly it might be pulled up, he felt what an ass he had previously made of himself."

THE first motor track race meeting held in Canada took place in Delorimier Park, Montreal, on the 26th and 27th ult., when Walter Christie, driving a 130-h.p. Christie, made the best time, he covering the mile in 1 min. 10 sec., this being claimed as a record for a half-mile track. C. Soules, on a 60-h.p. Stearns, was second, with 1 min. 14 sec. to his credit, and Barney Oldfield, on a 90-h.p. Stearns, third, in 1 min. 15 sec. The five mile-championship of Canada for cars of from 20-h.p. to 35-h.p. was won by L. D. Robertson on a Comet in 6 min. 44 sec.

SOME CURRENT TOPICS.

The Regulation of Traffic.

Although the methods of the London police as regards the regulation of traffic are looked upon as forming an excellent example for Paris and other large continental cities, there are one or two directions in which they could usefully extend their labours to the advantage of traffic generally. Fortunately the sight of a motor-bus *en panne* has recently not been quite so common as a year ago, but still they do occasionally break down, and are usually left standing at the point where the stoppage occurs, even when this is in the direct line of traffic. It should be the first thought of the drivers to push their vehicles either to the side or the centre of the road so as not to form an obstruction, and where this is not done, the police should insist upon it.

Another Cause of Obstruction.

Another cause of obstruction that I have lately observed in the West End is in those thoroughfares which at intervals have been provided by the authorities with islands in the centre of the road to ensure safe crossing to pedestrians, by dividing it into two stages. As these islands naturally restrict the wheeled traffic capacity of the thoroughfares at that point, it would be well if a regulation were issued rendering it illegal for any vehicle—whether automobile or horse drawn—to be allowed to stand, even near the kerb, between these islands and the pavement. Only the other day I noticed a street near the offices of the *M.C.J.* where on one side two cars were drawn up and on the other a horsed van, the island being directly between them. Not only was the advantage of the safety point to the public rendered entirely nugatory, but the capacity of the road, which normally is equal to two lines of up and down traffic, was reduced to one line in each direction.

Off-Set Crank Shafts.

A year or so ago a discussion took place as to the advantage of off-set crank shafts in petrol motors, *i.e.*, engines in which the crank shaft is slightly out of line with the centre of the cylinders. While there appears to be no doubt that some benefit is obtained by off-setting, the explanations that have hitherto been given have been somewhat of a too technical character to be readily grasped by motorists. Messrs. T. B. Jeffery and Company, makers of the American Rambler cars, have, however, lately issued a popular explanation of the principle which should render the idea clear to the merest novice. It runs as follows:—"Notice a man about to mount a bicycle. He always adjusts the pedal in that position where it will receive to best advantage his full weight on the first downward stroke. The best position for the pedal is just slightly forward of the centre of the crank shaft of the bicycle. If he mounted when the pedal was immediately over the centre of the crank shaft, his weight would fall directly on the bearings and the first downward stroke would be retarded, and, therefore, weak. Now imagine the man's leg as the piston of an automobile engine; the pedal of the bicycle as the crank pin and the crank shaft of the bicycle as the crank shaft of the motor. In the ordinary engine the crank pin and piston (the pedal and the man's leg) are directly over the dead centre, and until the crank passes the turning point all effort is wasted. Thus, when the explosion occurs, the greatest force falls upon the bearings. In the Rambler engine at the instant the explosion occurs above the piston the crank pin has moved past the dead centre; the crank shaft is in a position to receive the full pressure and turns without friction. Consequently there is no side thrust of the piston, and wear on the cylinder walls is thus saved."

THE Homeland Association is doing really excellent service in popularising many places at home, which have been comparatively neglected. Its handbook to Rye and Winchelsea—specimens of the illustrations from which have appeared in recent issues—is typical of many others and should prove of great utility to the towns with which it deals.

A TRAVELLING MOTOR REPAIR SHOP.

"IF you want help, stop this van." So reads the notice that caught our eye on a motor vehicle which we passed on the Brighton road the other day. Desiring to ascertain the full meaning of the catchy sign, we hailed the van and found that it belongs to the Motor

Repairing Company, of 19, High Road, Chiswick, who some time ago hit upon the idea of placing a travelling motor repair shop on the road, with the view of assisting any motorists who may from one cause or another become stranded. A general view of the vehicle—which is built on an Argyll 16-20-h.p. chassis—is given below, while the upper picture shows the "workshop," which was fitted up on the company's premises, and by their own men. The outfit comprises a good stock of Barker's tyres and tubes, for which the firm are sole district agents, sparking plugs, bolts and nuts of all sizes, ignition wire, charged accumulators, springs, block and tackle for pulling cars out of ditches, towing ropes, fire extinguisher, petrol, oil, &c. The plant also includes a powerful blow lamp, for straightening damaged axles, and a couple of Harvey Frost vulcanizers

with which tyre repairs can be effected on the road. In a word, almost every article that may be required is carried on the van, and practically any repair can be undertaken on the spot, the vehicle being in charge of expert mechanics. The van is kept tuned up ready to turn out at a moment's notice, while it is on the Brighton road, as a rule, every Sunday, when it runs to a time-table, and is in telephonic communication all the way down. The Motor Repairing Company are to be congratulated on their enterprise.

THE SOCIAL WHIRL.

THE King visited Mr. and Mrs. James at West Dean Park, Sussex, on Monday, when several of His Majesty's intimate friends were invited to meet him, including Mr. A. Sassoon. Among the cars belonging to Mr. James which were utilised for the convenience and conveyance of the guests were an 18-h.p. Charron, a 10-14-h.p. Renault, a 12-h.p. Panhard, and three Maudslay vehicles, the latter comprising a 40-h.p. six-cylinder car, a four-cylinder one of 35-45-h.p., and a 12-h.p. car.

PRINCE FRANCIS OF TECK, after attending the annual dinner of the Northamptonshire A.C., consented to become a patron of the club. On the day of the event he drove over many miles of roads in the county and congratulated the surveyor, Mr. Morris, on their condition. Lord Annaly, M.F.H., was the host of the Prince, whose compliment to Major Leslie Renton, M.P., for his conduct of the Lights on Vehicles Act through Parliament was well timed, and well deserved by the recipient.

THE scheme of the R.A.C. for dealing with the inconsiderate driver is not wholly the original thought of 119, Piccadilly. Mr. J. L. Wanklyn, whose associations with Bradford were recently detailed in this column, was among the first to suggest

King Alfonso of Spain inspecting one of the Austrian military motor vehicles during his recent visit to Vienna.

a plan of campaign for the institution of prosecutions against those who discredited the motor movement. That was in the days when Mr. C. D. Rose presided at the R.A.C. Mr. Wanklyn, who has a 20-h.p. Panhard and a 16-h.p. Clement-Talbot car, is still at Leenane, in Connemara, and "being in a mountainous and unenclosed country I have," he writes, "imposed a speed limit of fifteen miles an hour upon my driver. I have had no accident with either of these two cars, and am on the best of terms with all my neighbours, but I go in daily dread of the motorist on tour."

I DO not think that Mr. Wilfrid Ashley, M.P., is quite satisfied with Mr. Haldane's assurance that sufficient funds have been provided in this year's Army Estimates for experimental work in balloon and airship construction. In 1903-04 the expenditure on balloon work was £14,600; this year it is about £1,000 less for both balloon and airship experiments.

ON Saturday a mishap befel the Bishop of Carlisle and the Dean of Carlisle (Dr. Barker) through the breakdown of the motor-car which the latter's late London parishioners recently presented to him on leaving for the North. The Bishop was due

to consecrate a new church at Plumpton, near Penrith, and the Dean had also arranged to be present, motoring to the place via Rose Castle, where he took up the Bishop. Unfortunately the car broke down in a desolate spot, and the passengers did not arrive at their destination till an hour after the time of the ceremony. On entering the pulpit the Bishop explained that he had sometimes been asked why he did not himself possess a car, and he had jocosely said, what he now found a reality, that the reason he had not had such a vehicle was that he always liked to get to the end of his journey. He had begun to melt in the matter, and it had been more than once suggested to him that the diocese might give him a car, but he had not hitherto welcomed the suggestion, though he was beginning to consider whether it might not be advisable to consent. The experience of that afternoon had stopped his melting, at any rate for the present.

MR. LEONARD BRASSEY, one of the candidates for North Northamptonshire, who is addressing meetings in the constituency, has been the victim of an amusing adventure. In motoring to Corby at night his progress was impeded by two stray horses, one of which ran to a gateway, while the other persisted in keeping in front of the car. The chauffeur alighted to drive it off the road, and while he had gone in the darkness a young lady cyclist rode up and was too nervous to pass the horse at the gate. Mr. Brassey went to her assistance and piloted her safely by. In the meantime the chauffeur returned, and, thinking his employer was in the rear part of the car, drove on to Corby. He did not discover Mr. Brassey's absence until he reached the village, when, of course, he speedily drove back. Mr. Brassey arrived late at his meeting, and his apology, when he laughingly described his adventure, caused much merriment.

WHEN the Rev. Dr. Jacobs left the Newcastle diocese for St. Albans his admirers presented him with an automobile; Dr. Straton has not long occupied the bishopric before being similarly speeded by his friends. The Bishop of Newcastle hopes the car will never be driven to the detriment of the law; at the same time, he has assured those who subscribed for the gift that the grass shall not grow under its wheels. Here are some details of the new vehicle, towards which the Duchess of Grafton, the Dowager Lady Tankerville, Lord Kinnaird, Sir C. Morison Bell, Bart., Sir T. Fowell Buxton, Mr. Martin Sutton, and 354 other persons subscribed. The chassis is by Messrs. Armstrong, Whitworth and Co., the body work by Messrs. Sir Wm. Angus and Sanderson, while its fittings include a clock presented by Mr. H. B. Hohler, a reflecting mirror given by the Rev. W. T. Moran, and a carriage mat sent by the inmates of the Newcastle Diocesan House of Refuge.

BISHOP WELLDON, who was formerly head master at Harrow School, recently spoke at a meeting at Aberdeen, deploring the existence of effeminacy among the sons of rich parents. In replying to this suggestion Dr. Wood, the head master of Harrow, is of a contrary opinion, although he agrees that luxury at the Universities is undoubtedly increasing. At either Oxford or Cambridge there is, according to Dr. Wood, a small set of rich undergraduates who keep motor-cars in addition to hunters and polo ponies. In disposing of £2,000 a year he declares that £300 is probably to be put to the expense of the undergraduate's motor-car.

THE recent reference to the number of cars frequenting hotels in country districts seems to have set some of my correspondents a-counting. At the Bull Hotel, Cambridge, for instance, fifty cars call in a week—testimony to the amount of money that is being circulated owing to the motor-car.

LOLLIUS.

THE Pacific Steam Navigation Company announce that the French Minister of Public Works has appointed the necessary officials at La Rochelle-Pallice to examine touring motor-cars arriving from England and to issue the necessary documents.

Should the Tourist Trophy Race be Repeated?

THE EFFECT OF THE "FOUR-INCH" RACE—LONG v. SHORT STROKE ENGINES—SUGGESTED
NEW REGULATIONS.

THIS week we are able to add the views of three well-known firms represented in the recent Four-Inch Race with regard to the continuance of the Tourist Trophy event. As we foreshadowed in our last issue, our symposium has shown that while a number of manufacturers are emphatically against its repetition, the majority, on the other hand, are distinctly in favour of an annual contest. Various suggestions are advanced with regard to the rules under which the race shall be held next year. Such well-known members of the trade as Mr. T. C. Pullinger and Mr. C. Jarrott, for instance, are in favour of a further restriction in the cylinder bore to three inches. Several propose a limit to the stroke as well as to the bore, while others consider the lines of the 1908 contest as fully meeting all requirements.

Although opinions are divided as to whether the Four-Inch Race will have any effect on the general design of touring-cars, it seems to be generally agreed that it gave a stimulus to motor designers, who, by paying greater attention to the question of the size of valves, valve timing, inlet and exhaust ports, &c., have been able to produce engines which, size for size, develop considerably greater power than those of a year or so ago. Another point which this increased attention brought out was that, combined with the foregoing improvements, the employment of light reciprocating parts enabled a material increase in the stroke to be effected without any corresponding reduction in the rotative speed, thus enabling a higher piston speed to be maintained with a relative advance in the power output. With such an advantage to be gained it is not surprising that certain manufacturers went to much greater extremes in the way of stroke than has previously been experienced—at least in this country. It may be pointed out, however, that the bulk of the cars which took part in the competition were equipped with motors of a normal length of stroke, those of a few vehicles being, indeed, of the maker's standard type. Excellent as were the results obtained from the long stroke engines, it was, in our opinion, the "normals" which gave the most convincing demonstration of the progress that has been made in engine design in recent months; and, having this in mind, we certainly think that any improvement in touring cars which may result from the Four-Inch Race will be more due to the all-round advance in petrol motor construction than to the adoption of extremely long strokes.

STROKE AS WELL AS BORE TO BE LIMITED.

The Calthorpe Motor Company, Ltd., write that they "are certainly in favour of the Tourist Trophy Race being held next year, subject to the same conditions, with the exception that not only the bore but the stroke should be limited. This would be fairer for all concerned, and give the public a better idea as to the merits of the winning car. As regards our idea on long v. short stroke engines, this matter has already been ventilated sufficiently in the Press. We do not believe in abnormally long stroke engines, and our performance in the Four-Inch Race, where we obtained fourth position, although being the smallest engine of all cars entered, proves best that the short stroke engine can with advantage hold its own against motors with such abnormally long stroke, which can only be classified amongst the commercially useless freaks.

As regards the lessons learnt by the Tourist Trophy Race, we think they can be put in a nutshell, namely, that in the near future we shall see the heavy high-powered touring car completely disappear from the road."

"FOUR-INCH" CARS A POPULAR TYPE.

Mr. Warwick J. Wright, on behalf of the company bearing his name, remarks, "I do not think there is any doubt that the

Four-Inch Race will have a beneficial effect on the general design of touring cars. The probability is that in the future the four-inch four-cylinder car will constitute a very popular type of engine. If constructed properly, it is quite capable of developing all the power that is required for all normal conditions. It will take a big landaulet body up all normal hills on the top gear, and, if correctly designed, be economical in tyres and petrol, &c., and there can be little doubt that the Four-Inch Race has advanced this type of engine enormously.

With regard to your second query as to the merits of long versus short strokes in engines there can be no question. The long type of stroke makes the better and the more powerful engine for a motor-car. The long stroke engine is peculiar for its picking up qualities and "getting away," and especially for pulling hard down to the very last few revolutions. A short stroke engine can never have the life and vim. When I speak of long strokes, I do not mean abnormally long "freak" strokes, as, obviously, it is possible to go to extremes in this direction as in others, and all extremes are wrong. The efficiency of the engine is not only added to from a power point of view for a given size, but also economy in petrol and lessened wear and tear of the engine are the result.

With regard to your third query as to whether another Tourist Trophy Race is advisable in 1909, yes, certainly, and if one is held, we shall enter Metallurgique cars to compete. The course in the Isle of Man is necessarily slow and a dangerous one up to a point, but all sport is dangerous. It would lose its attraction if it were not so; in fact, it is this very spirit of competition and of getting round a dangerous course at the highest possible speed that adds to the enjoyment of driving and makes the race interesting. Incidentally, there is not a tithe of the danger the Yellow Press fondly imagines.

With regard to your fourth question, as to whether a petrol limit should be employed in future, I do not favour this proposition. It seems to me that the chief charm of the recent race lay in the simplicity of the rules; a manufacturer was given a certain bore, and, for the rest, he could do just as he liked. This necessarily sets numerous people working out their own ideas, and the result is bound to be good for the industry, and the simpler the conditions are, usually the better result. There could be no doubt that this year's Four-Inch Race was a distinct success, and this was largely due to the simplicity of the rules."

IN FAVOUR OF THE RACE.

Mr. A. Rawlinson, the managing director of Messrs. Darracq and Co., Ltd., sends us a brief but emphatic letter to the effect that "We consider that the result of the 'Four-inch Race' will have a very excellent effect upon the general design of touring cars, making for an increased efficiency in power and transmission." He adds, "There can be no doubt that the experience gained by going through a very arduous trial, over a course so well calculated to try every part of the mechanism and general design of the vehicles, cannot do other than exert a most beneficial influence upon the designs of the future. For these reasons we should be distinctly in favour of a repetition of the race in 1909."

A USEFUL little novelty has just been put on the market by Messrs. A. J. Dew and Co., of 8, Hart Street, Holborn, W.C., in the shape of a starting handle holder. The device, which is made of leather and of a neat appearance, is easily attached to the frame of the car by means of the strap provided, and affords an effective means of protecting the starting handle from mud and injury.

THE CLERGY AND THE CAR.

NOW that most of the Bishops and many of the leaders of Nonconformity possess their motor-cars, the subject as to whether such ownership is likely to assist their work is being settled apart from the discussion that recently took place in the religious journals on the subject. Everyone is agreed that visitation is facilitated, while the work of travelling necessary distances is considerably relieved of many of its hardships.

We are glad to learn that there are clergymen among the members of the Motor Union who render service as occasional correspondents, and are taking up with local authorities such questions as the erection of danger posts. Since the inauguration of the touring department of the Union, clerical motorists have added to the Union's indebtedness to them by sending diaries of tours undertaken during their summer vacation. The latest contribution comes from a rector in Oxfordshire, who, as a District Councillor, is accomplishing good work in the matter of danger-posts. He describes a tour of 927 miles, through seventeen counties, between July 1st and 31st, giving the daily runs and

CONTINENTAL NOTES.

The 1909 Grand Prix Race.

The delegates of the recognised national automobile motor clubs met at the A.C.F. in Paris on Monday to decide on the rules for next year's Grand Prix. This year, it will be remembered, the bore was restricted to 155 millimetres for four-cylinder engines, and the speeds attained were such as to play havoc with the tyres. Consequently, there was a general desire for reduction, but opinions as to how much the measurement should be reduced varied considerably, for, while France had selected to 140 mm., Germany and Belgium were said to be in favour of 130 mm. As the result of the discussion, a compromise was arrived at, the maximum bore being fixed at 130 mm. An alteration was also made with regard to the weight limit. This year's rule gave 1,100 kilos. as the minimum. France was for altering this to 900 kilos., Germany and Italy to 1,000, kilos. and Belgium and America to 1,050 kilos. In this France gained her point, the minimum weight being fixed at 900 kilos. The question of allowing detachable wheels in next year's race, and other matters, were postponed until the next meeting, which will be held at the end of November.

The British Military Aeroplane being removed to its shed after the accident last week.

incidents over routes between Bristol in the west, Cromer in the east, and Winchester and Windsor in the south, and sums up the chief experiences of the tour thus:—Great lack of horn-blowing round curves; drivers take it too much for granted that the road is clear; averted two collisions only by my own carefulness; paid drivers for the most part keep to middle of road too long. These conclusions are common among considerate drivers, and every effort should be made to secure publicity for the lessons they convey.

Recently several readers of the *M.C.J.* have written us as to the value of the automobile to the clergy, and the Rev. W. A. Errington, rector of Hunsdon, Ware, who is associated with the Hertfordshire County A.C., informs us that, "Personally, I can state that I have found my 10-12-h.p. Coventry-Humber, which I have had for over two years, most useful and very helpful in the parish. Only a few weeks ago I was asked by a parishioner to take a man to the infirmary at Bishop's Stortford who had been badly crushed in an accident by a steam plough working in my glebe field opposite the Rectory. In many ways I find the motor-car aids the parish priest. I think it trash for people to talk about the motor being 'inconsistent with ministerial dignity.'"

The International Road Congress.

The proceedings of the International Road Congress in Paris were brought to an end on Saturday last, when the members left the capital for a series of excursions in the South of France. At the final meeting at the Sorbonne a large number of resolutions which were passed by the different sections were submitted to a plenary session. One of the most important results of the Congress is the establishment of a permanent international bureau, with perhaps two delegates from each country, which will enable the results of the experience of the various countries to be followed up and scientific views collated. Apart from this the Congress has drawn up a series of recommendations, in the course of which attention is drawn to the necessity of taking great care to construct good foundations. A layer of concrete from four to six inches thick is especially recommended. As for the road itself, it should be composed of homogeneous materials which are hard, tough, resisting and not slippery. The Congress considers that the use of tar, bituminous products, and deliquescent salts is effective for reducing the dust, but at present the results are far from permanent, and further experiments with these and similar compounds are invited. Tarring, properly carried out, is declared to be incontestably a remedy against dust, and to a

certain extent a preservative against the wear and tear caused by all traffic, especially by fast motor vehicles. As for the plan of mixing the tar with the road material, the Congress awaits more definite results before formally expressing an opinion. Where motor traffic is not very heavy, it is considered that the present system of road making is sufficient, if it be carried out carefully and with proper materials. Roads should have the least amount of camber compatible with an easy run off of rain water. The outside of curves should be slightly raised, and there should be no obstruction to the view at curves or at the intersection of roads. A uniform system of marking distances should be devised, and for the benefit of international automobilism a uniform system of road signals should be adopted. These should be limited to four kinds, respectively warning against obstruction, including dangerous hills, corners, level crossings—by night as well as by day—and dangerous cross-roads. It was resolved that the next Congress shall be held in Brussels in 1910.

The Chateau-Thierry Hill Climb.

The eighth annual hill-climbing competition at Chateau-Thierry, France, was held on Sunday last. The competitors, of whom there were about sixty, were timed over a distance of a kilometre from a standing start. The fastest climb of the day was that made by Joerns on an Opel car in the 121 to 130 mm. bore four-cylinder touring car class (44 1-5 sec.). Beury, on a Darracq, won the 96 to 100 mm. bore category in 50 3-5 sec., and Champoiseau, on an Imperia, the 101 to 106 mm. bore section in 56 2-5 sec.

British Motorists in France.

Recent British motoring visitors to France with their cars include Mr. Edwin Cawston, London (35-h.p. Daimler), Duchess Adeline of Bedford (35-45-h.p. Renault), Mrs. Gallard (Renault) and Mrs. Tattersall, London (50-h.p. Charron).

The Kaiser Invents a New Motor-car Brake.

Following the example of his brother, Prince Henry of Prussia, the Kaiser is reported to have invented a new hub brake specially adaptable for use on motor-cars, and which is stated to offer the greatest possible security against the risk of refusing to act.

Belgian Motor-car Imports and Exports.

The value of the foreign motor-cars and parts imported into Belgium during the eight months ending with August last amounted to only £102,696, as compared with £119,728 in the corresponding period of last year. On the other hand, there has been an increase in the exports of Belgian motor-cars and parts—from £291,144 in the first eight months of 1907 to £335,776 in the similar period of the current year.

Aeronautical News.

The municipal authorities of Bagneres de Bigorre (France) are offering a prize of £400 through the Ligue Nationale Aerienne to the first aviator to fly from Bagneres to the summit of the Pic du Midi de Bagneres, a distance of 11 kilometres.—The aeroplane which M. Voisin is building for Mr. Moore-Brabazon is being fitted with a Metallurgique four-cylinder engine, having a bore of 106 mm. The motor only weighs just over 3 cwt., and during a long shop test has developed 58.5-h.p. at a normal speed of 1,000 revs. per min.—Baron de Caters is experimenting with an aeroplane at s'Gravenweezel, near Antwerp. The apparatus is of the triplane type and is fitted with a 50-h.p. Vivinus motor.—In the course of the last of several flights on Friday last week Mr. Wilbur Wright suddenly stopped his motor when at a height variously estimated at from 60 ft. to 80 ft. The aeroplane merely gilded towards the earth and alighted with its customary absence of shock.—The Academy of Sports, following the example of the Aero Club de France, has decided to confer its gold medal on Mr. Wilbur Wright.—The Malécot airship, which is a combination of steerable balloon and aeroplane, made its first long trip from

Issy to Vincennes on the 17th inst., in the course of which it very nearly came to grief. On the return journey M. Malécot was lost in the midst of a fog, which prevented him from seeing his way. Contrary air currents caused further trouble, the propeller got out of order, and he was obliged to come down near Saint Ouen. The work of repair took about six hours, after which Issy-les-Moulineaux was safely reached after a day's exciting excursion.

An Austrian Grand Duke as Motor Designer.

One of the most interesting motor vehicles which took part in the recent military manoeuvres in Austria was that built by the Skodawerke, of Pilsen, to the designs of the Grand Duke Leopold Salvator. The feature of the lorry, which is fitted with a 40-h.p. petrol motor, is that all four wheels are driven by means of separate cardan shafts and bevel gear. During the

Motor Vehicles in the Austrian Military Manœuvres.

manœuvres it carried a load of 2 tons, and is stated to have given very satisfactory results.

Motoring in Spain.

Considerable excitement prevailed in San Sebastian the other day, when the Imperial Automobile Club of San Sebastian organised an automobile tour from that resort to Onate and back, a distance of about 150 kilometres. The King of Spain, accompanied by Queen Victoria, took part in the event, His Majesty driving his 120-h.p. Delahaye. About thirty-five cars participated in the outing.

Miscellaneous Items.

La Société des Transports d'Automobiles Normandie et Picardie is the name of a company which has just been formed in Paris (3, Rue Laffitte) with a capital of £2,800.—A Lorraine-Dietrich motor-bus has lately been put into service in the town of Arnhem, Holland.—The Hotchkiss Company have lately completed five special armoured motor-cars fitted with quick-firing guns for the Turkish Government.—Thirty-one machines are taking part in the Austrian Automobile Club's trial of industrial motor-vehicles which commenced on the 20th inst.—The programme for the 1909 motor-boat race meeting at Monaco has just been issued. The exhibition will be held on March 31st and April 1st; the launchings and trials take place from April 1st to April 3rd; and the actual races from April 4th to April 11th. There will also be a compulsory exhibition of all boats having taken prizes, this being held on the day following the last of the races.

TRIPS IN HOLLAND.

ON the suggestion of a well-known motorist who had spent some months in Holland, I recently toured in that delightful country, and can recommend the experience to those who have not hitherto ventured thither under the mistaken idea that it is only fit for those who possess motor-boats. True, canals are the national highways, but along their banks are good roads, well above the average, and generally in excellent condition. The main roads of Holland are well kept and the secondary ones are generally paved with a kind of brick known as clinkers. Road warnings and directions should be studied by the visitor. These are of Government origin, and, of course, accepted by all motorists as "things to be obeyed." The chief are speed limitation signposts, giving in white letters on a green background the specific number of kilometres per hour allowed, and notices of roads closed to motor vehicles indicated by white lettering on a red ground.

A convenient point from which to reach Holland is Hull—144 miles from Birmingham, 93 from Nottingham, 49 from Doncaster, 67 from Sheffield, 120 from Newcastle, 40 from

Now, with regard to itineraries, I suggest a few as excellent runs covering interesting country. First, there is the run of eighty miles to Amsterdam from Rotterdam. At the latter place garage accommodation can be obtained at either of the cities named above at 1s. 8d. per night. From thence the way is *via* Delft, where the Hotel Central has garage accommodation, to the Hague, with its Royal Palace and delightful resort of Scheveningen. Half-way on the journey is Haarlem, the centre of the Tulip country, and then through typical Dutch scenery the road leads to the capital of Holland. There the points of interest are many, while in the vicinity are Zaandam and Hilversum—delightfully quaint and quaintly delightful.

An interesting variation of route is to return from Amsterdam to Rotterdam by a route of forty-three miles *via* Gouda, with its old-world town hall in the market-place, and ancient church.

One of the most interesting runs is from Rotterdam to 's Hertogenbosch (fifty-eight miles) *via* the gabled houses of Dordrecht and the castles of Breda; thence to Utrecht is an afternoon's run, made longer by the halt that will be called to glance at the seventeenth century town of Zalt Bommel. Utrecht is one of the most famous towns of Holland, and its

Leaving the Quay at Rotterdam.

York, 137 from Liverpool, and 101 miles from Manchester. At their New Riverside Quay the North Eastern Railway Company have good facilities for the shipment of motor-cars, the vehicles being securely lashed to a tray and then hoisted aboard. The Hull City Garage at Hull, and the Naamlouze Vennootschap Auto Rijtuig Onderneming, 86-88, Baan, and Mr. A. J. P. Smits, 125, Noordsingel, at Rotterdam, work with the steamship service, and will take charge of a car on arrival and attend to shipping formalities at only a moderate charge.

Motorists contemplating the visit to Holland should acquaint the Hull and Netherlands Steamship Company of their intention. Those who are members of the R.A.C., M.U., the A.A., or any affiliated body, should secure the triptyque, which will simplify the formalities to be observed abroad. On arrival at Rotterdam the owner of the car must visit the Custom House, where the triptyque must be stamped, or the duty paid in cash if he is not the holder of a triptyque. The car will be landed on the arrival of the steamer, but cannot be removed until the Customs requirements have been complied with, which need not occupy more than half an hour, and then the visitor can drive away, as did those shown in the accompanying photograph as leaving the Quay at Rotterdam.

environs are attractive to those with antiquarian interests.

Away in the province of Friesland the visitor will see the dairy farming country of Holland and be charmed by the palace of the Stadtholders at Leeuwarden, while at Stavoren the roofs of many of the houses will be found at about the same level as the Zuyder Zee. From Leeuwarden the road to Rotterdam is about 150 miles, through a picturesque country. Kampen is one of the interesting places on the way, so full of antiquities that the whole town seems to be a museum, and at Amersfoot the excellent roads will give opportunities for speed that "never Surrey knew"—to quote a poet whose works remain unpublished. A few other charming spots may be mentioned. Franeker and Harlingen are not far apart, the latter being built on the site of the original city of the same name which was immersed in 1134. Zwolle, Groningen, Apeldoorn and Arnhem need but be mentioned, the latter being the centre of the Dutch Switzerland.

On another page is given a list of hotels and garages in the various towns named in the foregoing sketch, for which we are indebted to the Hull and Holland Steamship Service Joint Committee, and which will be found of real service to those who may take the advice of the writer and go to Holland.

A YORKSHIRE MOTORIST.

THE Shrewsbury and Chalfin Tyre Company, Ltd., were awarded a bronze medal at the Franco-British Exhibition for their patent detachable rim.

A CONFERENCE of delegates from local authorities in the Metropolitan area will be held at the Mansion House (London) on Monday next to consider the motor-car problem.

THE American Auto Supply Company, of 13, Cité de Puy, 23, Boulevard Pereire, Paris, have lately brought out the useful

little motor lamp-lighting device illustrated herewith. As will be seen, it comprises a tube A in which a large portion is cut away to allow an ordinary match to be laid. By means of the rod B the match is pushed between the jaws D, where by reason of the friction it becomes ignited. The arrangement will be found very handy, especially in windy weather, as it is only necessary to open the front glass sufficiently to allow the stem to be introduced into the lamp. As the illustration shows, the whole operation can be done by one hand, the lighter being held between two fingers at a, enabling the rod B to be pushed down by the thumb.

MR. J. PULLAR PHIBBS has opened offices at 35, Dawson Street, Dublin, for the purpose of carrying on business as a consulting motor engineer. He is prepared to supervise the overhauling of motor-cars and also the checking of repair and other accounts on behalf of owners of motor-cars.

ONE of the novelties at the exhibition held in Paris last week in conjunction with the International Road Congress was a motor-cycle street sweeper. The machine, which is of Austrian design, is somewhat on the lines of a motor-bicycle with side-car attachment, the brush and its adjuncts taking the place of the passenger's seat.

A GOOD type of motor coat recently brought to our notice is the "Nobility," made in a dark grey frieze material by the Express Rubber Co., of 11, Great Eastern Street, London, E.C. It is of excellent shape, well finished, and supplied at a price which marks a great descent from those which prevailed for motor garments in the early days.

THE exports of motor-cars and parts from the United States during the eight months ending with August last attained a value of only £800,962, as compared with £950,402 in the corresponding period of 1907. The United Kingdom headed the list with £298,293, Canada being second with £173,320 and France third with £105,264.

A NATAL correspondent writes that practically all the doctors in Durban and most of those in country districts have gone in for cars, and a large number of business men, notably agents, travellers, surveyors and architects, are finding that if they wish to keep up with the times they have to adopt automobiles to enable them to get about quickly.

DURING the eight months ending with August last foreign motor-cars and parts of a value of £360,005 were imported into the United States, as compared with £513,300 in the corresponding period of 1907.

THE Western Motor Company, having taken over the garage at Monmouth Place, Bath, propose shortly to extend the same, and to increase the facilities already possessed for the repair of vehicles as well as the stocking of accessories, &c.

A PETROL-DRIVEN fire engine by Messrs. Dennis Bros., Ltd., has been submitted for test at Bradford before the Fire Brigade Committee. At a meeting held after the demonstration it was decided to re-affirm a resolution passed a few weeks ago recommending the Town Council to purchase the same.

IN consequence of the many complaints from private residents and a petition from the local Tradesmen's Association, the Kensington Borough Council have decided to ask the Commissioner of Police to take such action as will secure a mitigation of the danger and nuisance caused by the excessive speed of motor vehicles along the High Street, Notting Hill Gate.

AT the meeting of the Cornwall Farmers' Union, at Truro, several resolutions were adopted with regard to motor-car traffic. A protest was registered against the tremendous candle-power of the lights carried by many cars at night, as it was impossible to get horses to face them. One member said it was as well to be under the searchlight of a man-o'-war as under some of the big motor-car lamps.

IF it were possible to design an indicator which would show in pounds, shillings and pence the effect on tyres of taking corners too fast, or of suddenly jamming brakes on to their fullest extent, many owners of motor-cars would be more than surprised. The expense they were incurring by such methods would come home to them with full force, and they would be less likely to attribute tyre trouble to bad luck, faulty covers, or some other cause not directly within their control, than they are at present.

MESSRS. SUTTON BROS., automobile engineers, Swansea, have recently arranged a contract with the General Post Office to deliver the mails between Swansea and Penycae, and are using the 16-h.p. Lacre van illustrated herewith in the work. The distance out and home is forty-four miles, and thirty-two calls

have to be made en route, these occupying from 20 to 30 min. For the outward journey 1 h. 50 min. is allowed, and for the return trip 1 h. 57 min. To keep to the scheduled time, the van has to attain a speed of about eighteen miles per hour.

BELIEVING that many motor-car accidents are caused by defective eyesight, the Medical Society of Marseilles has recommended to the French Government that no chauffeur be granted a driver's licence without first undergoing a test of sight similar to that required for drivers of locomotives.

THE provision of a motor fire engine is now being considered by the authorities of Belfast.

MESSRS. S. SMITH AND SON, LTD., whose speed indicators are known to motorists, have been awarded a Diploma of Honour for their watch and clock exhibit at the Franco-British Exhibition.

AT Wishaw Mr. J. H. Thompson has facilities for the development of his motor business; in the Main Street he has showrooms for accessories, &c., and in Russell Street has plant for motor repair work.

MR. C. A. SMITH sends a copy of the Cobham time-table issued by the White Lion Hotel, of which he is the proprietor. This establishment is well-known to motorists, is two miles from the track at Brooklands, and is well arranged for the accommodation of cars as well as refreshment for those who drive the same.

THE Mechanical Branch of the American Association of Licensed Automobile Manufacturers has published the complete particulars of the A.L.A.M. standard sparking plug. The specification provides for a $\frac{7}{8}$ -in. plug eighteen threads to the inch, United States standard, in which a straight thread is used in place of the tapered pipe fitting at present in common use. In addition to the dimensions shown on the accompanying drawing the following are also mentioned. The material is to be $1\frac{1}{8}$ -in. round; the head form milled hexagonally with a short diameter of $\frac{7}{8}$ -in. The flange is to be circular, $1\frac{1}{8}$ -in. in diameter by $\frac{3}{8}$ -in. in thickness, the face to have an annular seat $\frac{1}{8}$ -in. wide, and suitable for a copper-asbestos washer. The blank for the

- | | |
|---|--|
| A.—One and one-eighth inch ($1\frac{1}{8}$ "). | E.—Not less than one-half inch (min. $\frac{1}{2}$ "). |
| B.—Seven-eighths inch ($\frac{7}{8}$ "). | F.—Not more than one-eighth inch (max. $\frac{1}{8}$ "). |
| C.—One-eighth inch ($\frac{1}{8}$ "). | (depth of recess—not over depth of thread.) |
| D.—Seven-eighths inch ($\frac{7}{8}$ "). | H.—Three-quarters inch ($\frac{3}{4}$ "). |

thread must be $\frac{7}{8}$ -in. in diameter and not less than $\frac{1}{8}$ -in. long. The recess adjacent to the flange must be not over $\frac{1}{8}$ -in. in width and of a depth not greater than that of the thread. The nut head for the packing gland is to be hexagonal in form with a short diameter of $\frac{7}{8}$ -in. As the specifications extend only to the dimensions of the plug and packing gland, it is obvious that the type of insulation to be employed as well as its form and that of the sparking terminals is left open to individual manufacturers.

MR. ROBERT W. A. BREWER, A.M.I.C.E., will read a paper before the Society of Engineers on the 2nd prox. at the Royal United Service Institute, Whitehall, S.W., upon the flow of liquid fuels through carburettor nozzles. This paper, which supplements the one of last session for which Mr. Brewer obtained the president's gold medal, will deal principally with the action of a jet tube and its effect upon the flow of liquid fuel. There are a number of tables and curves in the paper which are the results of experiments extending over some twelve months, which show very clearly and concisely the amount of petrol which flows through a jet orifice of any size between 0.9 and 1.4 mm. diameter, and through all the range of suction or negative pressures which are likely to occur in actual practice. There is also a certain amount of experimental data showing the relative behaviour of petrol and benzol under these conditions. The whole object of the paper has been to demonstrate that, by a method of simple calculation and the use of the data which have been obtained, a fairly accurate determination may be made as to the size of jet orifice which will be required for any particular size of engine or set of conditions.

THE Woking District Council is about to undertake a campaign to see that the bridges which span that length of the Basingstoke Canal within their area are brought into a proper state of repair.

THE circular which the L.G.B. recently issued to local authorities in England has been forwarded to similar bodies in Ireland by the Local Government Board of that country, together with a note expressing the hope that it will receive the earliest possible consideration by the various councils.

MR. WALTER WILLIAMS has an "all night" garage at Plymouth, from which he supplies covered cars for hire for any period, or admits any belonging to visitors. In his advertisement in the Devonshire papers he is taking advantage of a recent incident which occurred on Dartmoor, and offers "special terms to escaped convicts."

Too much care cannot be taken by motorists when driving on the hills which abound on the roads between Eastbourne and Seaford. During the past few years many accidents have occurred in this district, some of them with fatal results. The most recent disaster is one which occurred on East Dean Hill on the 25th ult., when, owing to the car running back, a young lady received injuries which have since resulted in her death. At the inquest the chauffeur concerned in the case was spoken of as doing all in his power to prevent an accident.

ON the evening of Wednesday, last week, one of the new 38-h.p. Daimler (1909 type) cars, in charge of two drivers and an independent observer, left Coventry with the intention of running as far north as Löckerbie and then south to London, if possible, without any involuntary stop of any description. In this the vehicle was entirely successful. Not only did the engine never stop running during the 650-mile journey, but, except on two occasions for the convenience of the passengers, the vehicle itself never ceased to move. The car arrived at the Royal Automobile Club shortly before Mr. C. Y. Knight commenced to read his paper on the "Valveless Engine." This achievement is of particular interest as it is the first observed performance made by the new Daimler motor.

THERE are many cars, up and down the country, the engine, transmission and body-work of which are all in excellent condition, the only fault being that they have somewhat an ancient appearance, due perhaps to the shape of the bonnet and the radiator. Owners of such vehicles will be interested to learn that Mr. Joseph R. Bramah, sheet metal worker, 16 to 24, Chapel Walk, Fargate, Sheffield, is making a special feature of modernising them by fitting new bonnets and making certain additions to the radiators so as to give them the appearance of the honeycomb type. Where full dimensions are furnished Mr. Bramah is frequently able to carry out the alterations without it being necessary to send the car to his works, but where this is possible, he much prefers it to be done. Mr. Bramah has, we understand, already had a number of cars through his hands for the modernising process, with very good results.

THE third edition of the Encyclopædia of Motoring has just been published by Messrs. Meccredy, Percy and Co., Ltd. This is an encyclopædia in the fullest sense of the word, for not only does it give every term in connection with motoring, with the French equivalent and a clear definition, but the more important sections are dealt with at such great length that any student will learn all that is necessary for him to know about the modern motor-car, its component parts, and the troubles of the roadside. A few examples will bear out this claim. To "Battery," for example, 17 pages are devoted; to "Carburettor" 17 pages; to "Change Speed Gear" 24 pages; to "Coil" 11 pages; to "Cost of Motoring" 8 pages; to "Driving" 26 pages; to "Ignition" 58 pages; to "Overhauling," 29 pages; to "Repairs and Adjustments" 127 pages. It is a veritable *vade mecum*, supplying information on every point, and the motorist who is in trouble need only look up the tables that are given to diagnose the cause and find a remedy, while in the article which forms the balance of "Repairs and Adjustments" he will receive explicit instructions as to how to remedy these troubles. The present edition differs vitally from the two which preceded it, and should add to the reputation of the author, Mr. R. J. Meccredy.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE AUTOMOBILE ASSOCIATION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Many statements, more or less inaccurate, concerning the work of the Automobile Association have lately appeared in the Press. My committee, therefore, thinks it advisable that I should officially indicate the policy of our Association, in order that misunderstanding may be removed from the public mind. The Automobile Association has never wavered in its antagonism to certain methods of enforcing the speed limit; moreover, it is of opinion that in many instances this section of the Act has been exploited for the purpose of replenishing the local exchequers rather than from regard to the safety and comfort of the general public.

The Automobile Association's Committee of Public Safety has been in existence for a considerable time, and so long ago as May last it was hard at work; it cannot, then, be said that its genesis was due to an

marked improvement in the behaviour of motorists who were previously a cause of annoyance. In one instance a gentleman offered to find accommodation for the village patrol as a mark of his appreciation of the man's services.

In addition, our patrols constantly assist the police by giving evidence in court in cases of reckless behaviour witnessed by them whilst on duty. Our experience is that when accidents in which motorists are implicated occur on the roads patrolled by our men, one of the first things the police do is to appeal to A.A. patrols for assistance in tracing cars, the numbers of which, whether owned by members or non-members, are carefully recorded, together with the place, time of occurrence, colour of vehicles, &c. In future it should be extremely difficult for any motorist, so lost to every sense of humanity as to drive off without stopping to render assistance, to escape the punishment he so richly deserves, because he must almost inevitably pass some of

Touring in Holland.—A Halt for Supplies in Utrecht. A Dutch Speed Limit Sign will be seen on the right of the picture.

[De Au'o.]

anti-motorist Press campaign, conducted during the Parliamentary recess. This committee deals with cases of inconsiderate and reckless driving, a large proportion of which are reported by the association's patrols from all parts of the country. Complaints are also received from motorists themselves, many of whom are members of the association, as well as from cyclists, pedestrians, and dwellers near the main roads. In no single instance is a complaint allowed to remain uninvestigated, and it is encouraging to find that in the majority of cases frank acknowledgments on the part of car owners and promises of amendment have been the result of our representations. In other cases the committee has been called upon to point out definitely where the offender has in its opinion been to blame, and in a small minority of cases it has been deemed necessary for the Public Safety Committee to advise the General Committee that offending motorists should be expelled or prosecuted.

A corps of point duty men and timekeepers has for a long time past been engaged at a very large weekly expenditure, and it is a special source of gratification to us that letters are frequently received from prominent residents in villages where patrols have been told off to regulate traffic, thanking us for placing our men amongst them, and expressing the hope that we should continue to do so, because of the

our patrols, who will certainly take his number, and so be in a position to put the police upon his track.

I venture, on behalf of my committee, to ask the assistance of your journal in giving publicity to this letter, which is not merely an exposition of things about to be done, but a plain statement of fact as to what has been and is being carried out in the interests of public safety.—Yours truly,

W. J. BOSWORTH, Colonel.
(Chairman of the Automobile Association.)

A MAGNETO TROUBLE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter from "S. M. T." in the *M.C.J.* of October 10th regarding magneto trouble, I have had something of the same kind. After expert electricians had worked for a couple of days they found that the red fibre composition which surrounds the distributor, and which is entirely covered by some dark composition resembling vulcanite, had lost its insulating quality, and that consequently the spark was passing through the red fibre. The latter has now been re-

placed by vulcanite and the magneto is all right. Mine is a Nilmelior magneto. I have had a car for several years, and this is the most difficult trouble I ever had to overcome, and I have had a few. Trusting this may be of service to some motorists.—Yours truly,

MAGNETO.

CLEANING RADIATORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you or any reader of the *M.C.J.* could advise me as to the proportion of sulphuric acid that should be used with water for washing out furred-up radiators, and how long should the solution be left in the radiators, without damaging the pipes? If there is any other way of cleaning radiators than by the use of acid, I should be glad of the information.—Yours truly,

R. STEVENSON.

[We should advise our correspondent in the first place to try a very strong solution of soda water to clean the radiator, letting this stand all night. This would not have any ill effect on the metal. If this treatment is not found effective, a solution of sulphuric acid in the proportion of twenty parts water to eight of acid may be tried. As to the length of time, this depends entirely upon the amount of fur which has to be removed. If very bad, a somewhat stronger solution may be used, but this would have to be carefully watched. It will also be necessary to thoroughly wash out afterwards, the best way to do this being to allow clean water to run through for a short time.]

The Argyll Motor Fire Engine lately added to the equipment of the Dundee Fire Brigade.

The vehicle is fitted with a 50-h.p. four-cylinder engine, three speeds and reverse gear-box and worm-driven live axle. The ladder is telescopic and can stretch to a length of 36 ft. Ample accommodation is provided for 1,600 ft. of hose. The machine passed through its official tests with flying colours, negotiating Constitution Brae and other hills in the city of Dundee with ease.

CHARGING ACCUMULATORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you would advise me as to the best way of charging the accumulators of my car from thirty-two E.P.S. cells with smallest waste and at least cost. Could it be done by coupling two of the cells to the accumulator, or should I couple three cells and insert a small resistance? I do not wish to have a lamp in use all the time if it is not necessary.—Yours truly,

W. HOESON.

[To recharge a 4-volt accumulator from cells forming part of a lighting set, it is necessary to connect up to three cells of the large set, and put a resistance in series with the accumulator being charged. Two cells would not be sufficient, because the voltage will only balance with the small accumulator, and three cells would be too much, therefore the resistance is necessary. If a small ammeter is connected in the circuit, the amount of the resistance can be regulated to obtain the right charging current. It is advisable to charge from those cells in the large set which are used as the spare cells, these being, as a rule, under-worked, and charging from them should make no difference to the whole set when it is in use. This method of recharging is the most efficient, and there is practically no waste of voltage, and it is also very regular and certain. Care must be taken to connect the positive terminal of the 4-volt accumulator to the positive pole of the accumulators, which is usually painted red. If the connecting bolts of

the E.P.S. cells are loosened to make connections, they should be well tightened up after charging, as loose connections heat up and cause trouble.]

AN IGNITION QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am having trouble with my four-cylinder De Dion car. The corners of the squares of the contact breaker had worn uneven, so I took it down and made them all the same. The car does not now pull as well as it formerly did. Do you think interfering with the contact breaker has altered the time of firing? Any assistance you can give me will be greatly appreciated.—Yours truly,

DE DION.

[The car referred to by our correspondent is evidently the 1905 model De Dion of 15-h.p., the shape of the ignition cam of this type being square, but each corner is flattened, and it is these corners which actuate the rocker carrying the contact blade, thereby making contact. As "De Dion" says he has filed down these corners it is evidently the cause of the bad running of the engine, as the fact of his having filed the corners makes the flats wider, the result being that contact is not made and broken quickly enough. Under these circumstances we advise our correspondent to obtain a new cam.]

A SOLID TYRE QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should esteem it a favour if you could advise me on the following subject. I have charge of a 30-h.p. chain driven car fitted with Hoffman ball bearing road wheels. It is desired to gear the car down to eighteen miles an hour for a shooting brake, averaging a journey of fifteen miles per day. Is there any reason why the back wheels should not be shod with solid tyres, apart from extra wear and tear and vibration? I am fitting rubber buffers between axle and springs.—Yours truly,

W. J. BARKER.

[Solid tyres will be found eminently suitable for the purpose named, and good results may be anticipated if the speed is kept down to the limit specified, and if the section of the tyres is ample for the maximum load. The section and quality of the tyres is of the greatest importance, and we advise Mr. Barker to consult the manufacturers of the tyres he selects as to the correct width advisable. The car should be weighed, and the full number of passengers stated. Regarding the question of putting rubber buffers between the axle and springs, this should hardly be necessary if the latter are sufficiently strong, and if they are not it might perhaps be better to have an additional leaf inserted in each spring.]

CLEANING THE BODY WORK.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have received from time to time many valuable hints through the columns of the *M.C.J.*, but never to my knowledge have I seen anything referring to spots on the varnish of the bonnet and wings of a motor-car. I have the care of a 25-35-h.p. Italia car, and, running four months only, the bonnet and front wings look disgracefully, and no amount of labour will remove the spots. I should be glad if you can help me. I may say I have never at any time used paraffin or petrol in cleaning except underneath the car.—Yours truly,

W. J. W.

[The spots are probably due to the car having been out in the rain, or got spattered with mud before the varnish was properly painted. Many new vehicles have their appearance spoilt in this manner, and the only remedy is to have the surface flatted down and re-varnished. A newly-finished body may, with advantage, be well sponged over several times with plenty of clean cold water before it is taken out on the road. This hardens the surface of the varnish and prevents dust adhering. Spots such as "W.J.W." complains of are always difficult to deal with if mud has been allowed to dry on the surface of the bodywork, as in drying it acts by capillary attraction as a poultice and sucks the varnish, so that when the car is washed the surface is spoilt wherever mud has lain.

A simple and effective mixture to renovate varnish and remove marks that are not ineradicable is made by equal parts of raw linseed oil and malt vinegar. This mixture should be well shaken and applied by a nice soft rag, and the bodywork rubbed by it with a circular motion after the carriage has been carefully washed. A final polish should then be given with a clean dry cloth.]

ON Sunday, September 13th, a hub cap was picked up at Puckeridge. If the owner will forward a correct description of the cap to the Wheeler Cycle and Motor Works, Puckeridge, Herts, they will be pleased to send same on.

A CORRESPONDENT inquires for the names of the makers or agents for a special magneto plug, the peculiarity of which is the firing points, which, when the engine is first started, are very close together, but as the engine runs and the plug gets hot they automatically become further apart, thereby facilitating the starting of engines fitted with magneto ignition.

CLUBS AND ASSOCIATIONS.

ROYAL.

RECENTLY the scheme for association adopted by the R.A.C. has undergone some modification, the effect of which is to set forth very clearly that clubs which, in the future, associate with the Club must be associated with that body only.

MOTOR UNION.

At a meeting of the Ligue Internationale des Associations Touristes, held in Paris on the 11th inst., the M.U. was represented by Earl Russell, Mr. W. Ballin Hinde, Captain Kingston, and the Secretary.

THE M.U. issued 200 motor-car badges last month, making the total number disposed of thus far 4,600.

AUTO-CYCLE UNION.

THE last quarterly trial of the season promoted by the Auto-Cycle Union was decided on Saturday, over a route of 125 miles, starting and finishing at Uxbridge. Despite the greasy state of the roads twenty-two out of thirty starters made non-stop runs, and twenty-six riders completed the journey. Five of the machines were passenger vehicles, three being side-cars and two fore-cars. Times were taken up Dashwood Hill, on the outward journey to Banbury, and at Amersham Hill on the return, with the following results, the fastest time in each case being represented by zero:—

DASHWOOD HILL.

BICYCLES.

| Name. | Machine. | Time. |
|---------------------|---------------------|-------------|
| T. H. Tessier ... | 6-7-h.p. Bat ... | Zero. |
| W. G. McMinnies ... | 3½-h.p. Triumph ... | 3 3-5 sec. |
| W. H. Bashall ... | 6-7-h.p. Bat ... | 6 sec. |
| A. W. Bentley ... | 3½-h.p. Triumph ... | 8 1-5 sec. |
| W. H. Wells ... | 5-h.p. Vindec ... | 14 1-5 sec. |
| G. F. Cooper ... | 5-h.p. Vindec ... | 16 4-5 sec. |

PASSENGER MACHINES.

| | | |
|---------------------|-----------------------------|-------------|
| F. Eagles ... | 8-h.p. N.S.U. side-car ... | Zero |
| M. Geiger ... | 6-h.p. N.S.U. side-car ... | 6 sec. |
| E. W. Brewerton ... | 10-h.p. Lagonda tri-car ... | 39 2-5 sec. |

AMERSHAM HILL.

BICYCLES.

| | | |
|---------------------|---------------------|-------------|
| W. H. Bashall ... | 6-7 h.p. Bat ... | Zero. |
| W. G. McMinnies ... | 3½-h.p. Triumph ... | 6 3-5 sec. |
| W. H. Wells ... | 5-h.p. Vindec ... | 12 2-5 sec. |
| F. Applebee ... | 5 h.p. Rex ... | 18 1-5 sec. |
| T. H. Tessier ... | 6-7-h.p. Bat ... | 19 sec. |
| G. F. Cooper ... | 5-h.p. Vindec ... | 20 sec. |

PASSENGER MACHINES.

| | | |
|---------------------|-----------------------------|----------|
| M. Geiger ... | 6-h.p. N.S.U. side-car ... | Zero. |
| F. Eagles ... | 6-h.p. N.S.U. side-car ... | 14 sec. |
| E. W. Brewerton ... | 10-h.p. Lagonda tri-car ... | 44½ sec. |

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

THE Council of the Incorporated Institution of Automobile Engineers met on Wednesday of last week, at the Institution of Mechanical Engineers. There were present Mr. Dugald Clerk (in the chair), Dr. H. S. Hele-Shaw, Messrs. Chas. Wheeler, D. J. Smith, J. S. Napier, A. S. Hill, T. C. Pullinger, T. B. Browne, R. K. Morcom, Max R. Lawrence, J. S. Critchley, D. Leecham, A. Craig, J. Lyons Sampson, F. L. Martineau, and Rees Jeffreys (secretary).

The secretary reported the receipt of £10 9s. 6d. in donations to the Foundation Fund since the last meeting of the Council, including one of £5 5s. from Wolsley Tool and Motor-Car Company, Ltd.

Mr. Dugald Clerk proposed and Dr. Hele-Shaw seconded a vote of thanks to the Daimler Motor Car Company, Ltd., Coventry, the Rover Company, Ltd., Coventry, and the Wolsley Tool and Motor-Car Company, Ltd., Birmingham, over whose works the graduates of the Institution had been conducted on their summer tour.

The following were elected members of the Institution:—Messrs. A. F. Evans (Ipswich), W. Morgan (Coventry), V. G. New (Manchester), A. W. Reeves (Sheffield), A. A. Remington (Birmingham), A. J. Rowledge (Birmingham), H. J. Spooner (London), O. Clegg (Birmingham).

The following were elected associate members of the Institution:—F. Buckley (India), M. Graham-White (London), J. S. Irving (Coventry), A. F. Kemp (King's Lynn), W. O. Kennington (London), T. W. Loughborough (Dorking), W. L. Wilson (Hemel Hempstead), J. Davison (India).

Mr. Dugald Clerk suggested that, in view of the rapid growth of the aeroplane movement, a sub-committee should be appointed to collect information and report to the council on the science of the aeroplane movement. This was unanimously agreed to, and the following appointed a committee:—Mr. Dugald Clerk, Mr. F. W. Lancaster, and Dr. H. S. Hele-Shaw.

It was decided that centres should be formed at Birmingham and Coventry. Centre committees were appointed as follows:—Birmingham.—Messrs. O. Clegg, F. W. Lancaster, E. E. Baguley, A. Remington, and M. Shaw. Coventry.—Messrs. A. Craig, J. S. Napier, A. S. Hill, T. C. Pullinger, and W. Morgan.

A letter was read from the Society of Motor Manufacturers and Traders suggesting that a meeting of the Institution should be devoted to a discussion on the report of the Society on Horse Power Formulae for Petrol Engines. It was decided that the next ordinary meeting should be given up to this, and a committee, consisting of Messrs. Dugald Clerk, Mervyn O'Gorman, F. W. Lancaster, Max R. Lawrence, J. S. Critchley, A. Craig, D. J. Smith, L. H. Hounsfield, and C. R. Garrard was appointed to consider the report.

The preliminary report of Mr. Max R. Lawrence on the question of "Valve Setting for Explosion Engines" was received. Messrs. Max R. Lawrence and T. C. Pullinger were appointed to go further into the matter. In connection with this subject the M.C.J. valve-setting card will be sent free to any member of the Institution on application to Messrs. Cordingley and Co.

FOLLOWING the presidential address of Mr. Dugald Clerk on the 14th inst., reported in our last issue, was a discussion, in the course of which Dr. Hele-Shaw gave it as his view that the clutch was only a temporary adjunct to the automobile, and mentioned that great developments in connection with the hydraulic variable transmission were likely. Mr. J. S. Critchley advised the Institution to take up the study of carburettor improvements, and Mr. R. W. Brewer referred to his own researches in connection with carburetting, and said that the problem of temperature would have to be considered in connection with fuel economy, seeing that it influenced the flow of fuel through the jet by as much as 25 per cent. Mr. Max Lawrence referred to the president's suggestion to raise the gravity centre. This had made for greater stability and reduced oscillation in loco. work, but those results were not borne out in the motor-car. On this point Mr. P. L. Renouf referred to the many factors which were peculiar to the latter.

MANCHESTER.

THE concluding run of the season was held by the Manchester A.C. on Saturday, when there was a speed-judging trial. The cars assembled at the Brooklands Hotel, and a route card was handed to each member, comprising a run of between twenty and thirty miles in Cheshire. The competitors were expected to drive their cars at prescribed rates, the speeds given to the different cars ranging from sixteen to nineteen miles per hour. The first prize was won by Mr. T. W. Grace on a 30-40-h.p. Belsize, who was only 11 sec. too slow over the whole course. The second prize was obtained by Mr. A. C. Tattersall, 40-h.p. Siddeley, who was 2 min. 24 sec. out of his reckoning. The results, with approximate errors per mile, are as follows:—T. W. Grace (30-40-h.p. Belsize), ½ sec. slow; A. C. Tattersall (40-h.p. Siddeley), 6½ sec. fast; Mrs. E. A. Riley, (14-16-h.p. Belsize), 6½ sec. slow; A. W. White (14-16-h.p. Argyll), 6½ sec. slow; H. P. Wigley (20-30-h.p. Rapid), 7½ sec. fast; W. Stones, (40-h.p. Napier), 8 sec. slow; Mrs. D. W. W. Parry (20-30-h.p. Renault), 11 sec. fast; C. H. Occleston (28-36-h.p. Daimler), 16½ sec. fast; Mrs. D. A. Parkyn (40-h.p. Siddeley), 26½ sec. slow; H. E. Holmes (12-14-h.p. Swift), 41 sec. fast; F. W. Hobday (8-h.p. Sizaire) mistook the route. The first prize for the best kept engine was awarded to Mrs. D. W. W. Parry's chauffeur, and the second prize to Mr. D. A. Parkyn's chauffeur.

NORTHAMPTONSHIRE.

ON Friday of last week the Northamptonshire A.C. held its second annual dinner, with Sir Thomas Hesketh, Bart., its president, in the chair. After the usual loyal toasts Prince Francis of Teck proposed "Success to the Northants A.C.," which he mentioned was one of the first of the county clubs to express loyalty to the R.A.C. With regard to motor politics he felt that there must be one camp, one set of ramifications, and that a continuance of the dual method would lead to discord. Hence the dual idea had been cut right off. The parent Club was taking many steps forward and wanted the whole of the county clubs to affiliate to one great system for the benefit of the movement.

Major Leslie Renton, M.P., having replied, Lord Annaly gave the toast of "County and Borough Authorities," coupling therewith the name of Col. Sackville, the chairman of the Northamptonshire County Council. Col. Sackville spoke of the good relations between the motorists of Northamptonshire and the authorities, and said that the County Council had no idea of putting back the clock. They had no police traps, the chief constable having rightly decided not to place "controls" on straight stretches of road.

"Success to the R.A.C." was proposed to Mr. W. R. Adkins, M.P., Mr. J. W. Orde responding. Mr. F. H. Thornton, J.P., proposed "The President," and the Rev. W. Seggins Pratt "The Hon. Secretary," Mr. Sydney Harris, who briefly acknowledged the toast.

SCOTTISH.

EXAMINATIONS for driving and mechanical proficiency certificates, will be held as under:—Glasgow, Tuesday, October 27th; Edinburgh, Thursday, October 29th; Dundee, Thursday, November 5th; Aberdeen, Friday, November 6th; Inverness, Saturday, November 7th; Dumfries, Tuesday, November 17th; Hawick, Thursday, November 19th.

LINCOLNSHIRE A.C.

A MEETING of the committee of the Lincolnshire A.C. was held on Monday at the Great Northern Hotel, Lincoln. The secretary reported that the direction plates to be erected in the Bull Ring, Horncastle, in conjunction with the Horncastle District Council were now in position.

TYRE INFLATION PRESSURES FOR PALMER CORD TYRES.

In a recent issue we referred to the pamphlet under the title, "Is your Tyre Pressure Right?" which has lately been issued by the Palmer Tyre Company, Ltd. As the question of tyre inflation is just now attracting some attention, and as the Palmer Company have for some time been making experiments to ascertain the best inflation pressures for and the load-carrying capacity of different sizes of their cord tyres, the following extracts from the booklet will be of interest, especially as the trials have conclusively shown that the subject of inflation is intimately linked up with that of tyre economy.

In the first place it is important that motorists should get their cars weighed fully loaded. Each axle should be weighed separately with the full number of passengers in the car and all tools and spares, &c., as the distribution of the load varies according to the design of the car. The back axle usually carries the bigger load, and a higher pressure is therefore necessary for the driving wheels. If owners of cars would only consider the functions of a pneumatic tyre, they would perhaps better appreciate the importance of proper inflation. The weight of the wheel is not carried directly by the pneumatic tyre, as it is in the case of one of the solid rubber type, but by compressed air held in place by the cover. If the pressure of air is greater than necessary, the car is less comfortable in running, but no damage is done to the tyre. If the air pressure is insufficient to carry the load the tyre is distorted as the wheel goes round, and this causes very unequal strains to occur, which give rise to much friction and cause the fabric of the cover to wear very much quicker than it would with proper inflation. The outcome of the experiments above referred to is shown diagrammatically in the accompanying chart, from which the appended table indicating the

minimum inflation pressures—which must be fully maintained—for Palmer cord tyres has been compiled:—

| Load per wheel. | Minimum Inflation Pressure in lbs. per sq. inch. | | | | | |
|-----------------|--|--------|--------|---------|---------|---------|
| | Cwts. | 75 mm. | 90 mm. | 100 mm. | 105 mm. | 120 mm. |
| 3 | 3 | 40 | 30 | — | — | — |
| 3½ | 3½ | 45 | 35 | — | — | — |
| 4 | 4 | 50 | 40 | 36 | 32 | — |
| 5 | 5 | — | 50 | 45 | 40 | 35 |
| 6 | 6 | — | 60 | 54 | 48 | 42 |
| 7 | 7 | — | 70 | 63 | 56 | 49 |
| 8 | 8 | — | 80 | 72 | 64 | 56 |
| 9 | 9 | — | — | 81 | 72 | 63 |
| 10 | 10 | — | — | — | 80 | 70 |
| 11 | 11 | — | — | — | — | 77 |
| 12 | 12 | — | — | — | — | 84 |
| 13 | 13 | — | — | — | — | 94 |
| 14 | 14 | — | — | — | — | 98 |
| 15 | 15 | — | — | — | — | 105 |
| 16 | 16 | — | — | — | — | — |
| 17 | 17 | — | — | — | — | 102 |
| 18 | 18 | — | — | — | — | 108 |
| 19 | 19 | — | — | — | — | 114 |
| 20 | 20 | — | — | — | — | 120 |

As has already been mentioned, the above are the minimum pressures recommended; the tyres can be run, however, at any desired higher pressure, there being no danger of over inflation. Reverting now to the matter of maintaining the specified pressures, the Palmer Company point out that the idea held by some motorists that they can judge whether a tyre is properly inflated or not by the extent of its "side bulging" over the point of contact with the road is absolutely misleading if applied to cord tyres, as these do not bulge at the sides to anything like the same extent as ordinary pneumatics. In fact, judged in this manner, a cord tyre might appear fully inflated when only half inflated, owing to the fact that the cords are laid straight, whereas the threads in canvas tyres are always more or less curved. To obtain the best results from tyres the pressure should be tested frequently by means of a gauge; this only requires about three or four minutes, and the life of the tyres is greatly increased by always running them at the correct pressure. They add that the pressure gauges used in connection with pumps should never be depended upon alone, as they are often strained by use and register a much greater pressure than is actually in the tyre, the consequence being that many of those who imagine they give special attention to inflation get tyre troubles owing to the pump gauge being inaccurate. To obviate this they are now supplying a testing gauge by means of which the accuracy of the registration of the pump gauge can be tested.

Finally the Palmer Company point out that it should not be necessary to use the pump on any tyre more frequently than about once a month. If it is found that they require more attention than this to keep the pressure correct, it may be safely assumed that there is a slight leak, probably in connection with the valve, and it is better to correct this at once than to be repeatedly using the inflator. With regard to the point as to which size of tyre is best for any particular car, if the question of first cost is not the controlling feature, the makers advise the use of the largest size the car will take, as this allows the tyres to be run at a comparatively low pressure, thus giving the maximum degree of comfort.

MOTORING CONVENIENCES IN HOLLAND.

SUPPLEMENTING the article elsewhere on touring in Holland, the following list of hotels and garages in the leading towns, compiled from one of the excellent publications of the Hull and Holland Steamship Service Joint Committee, will be of practical service to visitors to that country.

Rotterdam.—Hotels: Leygraaff's, Maas, Coomans, Weimar, Victoria.
Garages: Naamloze Vennootschap Auto Rijtuig Onderneming, A. J. P. Smits.
Delft.—Hotel: De Balk Hotel Central—with garage.
The Hague.—Hotel des Indes, Vieux Doelen, De Twee Steden. Garage: Haagsche Automobiel Maatschappij.
Scheveningen.—Hotels: Palace, with garage, Kurhaus, Grand, d'Orange, des Galeries. Garage: Verwey and Lugard.
Leyden.—Hotel: Levedag—with garage.
Haarlem.—Grand Hotel Funckler—with garage, Scholten's.
Amsterdam.—Amstel, de l'Europe, Doelen, Bible, American, Victoria.
Garage: J. Leonard Lange, 114, Stadhouderskade.
Gouda.—Hotel de Zalm—with garage, De Romein.
Dordrecht.—Hotel Ponsen, Hotel Bellevue—both with garages, Pennock's Hotel.
Breda.—Hotel de Zwaan—with garage, De Kroon, Pret Jonkers.
's Hertogenbosch.—Hotel Central—with garage, De Gouden Leeuw.
Zalt Bommel.—Hotels: Gottschalk and Tivoli—both with garages.
Utrecht.—Hotels: Kastel van Antwerpen, de l'Europe, Pays Bas.
Garage, H. B. Goetsch, Maliebaan.
Leeuwarden.—Hotels: Nieuwe Doelen and de Klandery—with garages, Wapen van Friesland.
Kampen.—Hotel des Pays Bas—with garage.
Amersfoort.—Hotel Vergulde Zwaan—garage: D. H. Eyrink.
Franker.—Hotel de Korenbours—with garage.
Harlingen.—Hotel Het Heeren Logement.
Zwolle.—Hotel Het Heeren Logement—with garage.
Groningen.—Hotels: Drelen and Frigge, each with garage.
Arnhem.—Hotels: Du Soleil, Des Pays Bas, Rijn, Sonsbeek, Het Zwynshoofd, Bellevue. Garages: Van Dam van Polanen, Rijukude.
Apeldoorn.—Hotels: Van Der Burg and Nieuwe Kroon, both with garage.

PUBLIC SERVICES.

THE employees of the Eastbourne branch of the Provincial Motor Cab Company, Ltd., have held their first annual dinner, with Mr. T. B. Pink in the chair, and the chief constable (Major E. Teale) being among the visitors. The latter, in responding to the toast of his health, said he welcomed the company to the town, which it had benefited in several ways.

TAXI-CABS now await the arrival of the trains from London to Brighton between 5 p.m. and 8 p.m. every day.

M. HENRY BOISSY is now installed at 46, Knightsbridge, W., in connection with the opening of those premises by the Societe Anonyme des Automobiles Peugeot.

THE VALVELESS ENGINE.*

By CHARLES Y. KNIGHT.

(Concluded from page 712.)

THE bulk of criticism of the new motor appears to be directed at lubrication. The fact is, not one man in a thousand reading the description of the construction really comprehends its *modus operandi*. Our critics get an idea that we are depending upon perfect fit of the sleeves to hold compression. The impression is only natural, and is doubtless due to an erroneous comparison with the work of the steam slide-valve. I hope I may make it plain that the fit between the two sleeves and their relation to the water-jacketed cylinder bear no relation whatever to compression. We have successfully operated these motors with sufficient clearance between the sleeves to permit the introduction of a thin sheet of cardboard. I do not mention this as good practice, only to illustrate to what extent we can go in neglecting this fit. Upon the other hand, we have tested upon the block and run upon the road for hundreds of miles motors in which these sleeves are a "dead" fit. We do not regard the latter to be good practice either. Such experiments have been necessary to ascertain our limitations. Compression, so far as the ports are concerned, is held solely by the wide ring at the bottom of the head, from inside the cylinder. The spring ring beneath the segments comprising the ring against the inner sleeve and prevents the escape of any gas after the ports have passed behind the same. There is always a film of oil between the seat of this segment and the surface of the sleeve to seal the joint. The timing of the ports is controlled by eccentrics, which are turned integral with the shaft with such a mathematical precision that improper timing of port openings and closings is not possible after the motor leaves the shop, and it never needs adjustment. The eccentric shaft which actuates the sleeves travels at half the speed of the main shaft. The inner sleeve weighs 10 lbs. and the outer 6 lbs. on the 38-h.p. Their travel is 1 in. When the motor is turning at 1,200 r.p.m. the sleeves are travelling at the rate of 1,200 in., or 100 ft. per minute. The pull upon the pin of the inner sleeve at the top of the stroke is 62 lbs., and at the bottom, because of the slower travel as a result of the connecting rod's different angularity, the force is 40 lbs. On the outer sleeve the impact at the top is 34 lbs. and on the bottom 26 lbs. The pull of the two sleeves combined upon the eccentric shaft is 76 lbs. upward and 60 lbs. downward. Compare these pressures with the tons of impact of the explosion upon the gudgeon pin in the piston of any motor, or the strain upon the lugs which hold the cylinders to the base, and the groundlessness of any fears is at once apparent.

The sleeves are of cast iron; their bearing surfaces work under the very best conditions. The area of that portion of the sleeves which receives the lateral pressure of the piston upon its power stroke is 45 in. The greatest pressure occurs when the crankshaft has turned about 30 deg. on its outward explosion stroke. At this point, basing our calculations upon a maximum initial pressure of twenty-five atmospheres at ignition, we find a side thrust of 900 lbs. Divide this into the 45 in. and we have a momentary pressure of 20 lbs. to the square inch. The piston produces this pressure with less than one-third of the wearing surface, making 60 lbs. to the inch for that member, hence these sleeves are working under only one-third of the pressure of the piston, and at only one-tenth its speed. In practice under years of usage we find no appreciable wear.

I am frequently asked to what feature of design I attribute the motor's great flexibility. I am unable to find but one explanation for its ability to pull smoothly and tenaciously at abnormally low speeds, and that lies in the shape of the explosion chamber. To obtain that steam-like flexibility which pulls steadily at slow speeds, a spherical explosion chamber is necessary, and the less wall surface in proportion to volume, the greater the range of speeds, all other conditions being equal. Undoubtedly, the position of the sparking plug has also much to do with flexibility. The surprise in the operation of the motor lies in the fact that instead of being more difficult to cool than the standard type, it possesses a standing up quality which, so far as we are able to ascertain, is unprecedented in any form or design of high speed internal combustion engine. One of our 114 by 140 mm. motors has been under constant load for fifty days to an extent which, if employed driving a touring car, would have travelled with its full load up a 7 per cent. grade for 14,850 miles at the rate of 33 miles per hour. The grade of 7 per cent. about equals the steepest inclines between London and Coventry on the Holyhead road, and the power of the motor is sufficient to pull its load up the steepest of these inclines steadily at 33 miles per hour.

There has been considerable criticism of various details of construction which, strangely enough, have in practice worked to perfection. The actuating of the sleeves from one side has been referred to as unmechanical. The fault is fancied, not real; the bearing surfaces are too great and the sleeves too long to permit any binding or cramping to occur; in fact, in operation these sleeves have proved themselves to be remarkably free from causing trouble.

So far as injury of the ports by burning is concerned, all I can say is that they do not burn; they are never exposed to the extreme heat of the initial explosion. At the time of the explosion they are between two walls of water, from between which they do not emerge until the heat and pressure have been reduced through the expansion of the gases as the piston travels outward on the power stroke. So far as cooling the sleeves is concerned, the reciprocating motion appears to

exert a wonderfully beneficial influence. Doubtless two films of oil between the piston and the water jacket might act as an obstruction to the dissipation of heat were the sleeves at a standstill and the oil undisturbed. But the constant rubbing together of the sleeve surfaces is an ideal operation for transferring heat from one to the other and in turn to the water jacket.

It will probably have been observed that I have had nothing to say concerning weight. I believe this to be a matter so closely associated with the policy of the engineering departments of the various concerns that comparisons are almost impossible. Employing the same weight flywheel used on the 1908 Daimler, the 38-h.p. valveless came out at about 12 per cent. lighter. Then the unexpected development of about 10 per cent. more power caused some strengthening of parts, particularly in the cylinders and motor base, which added about 15 lbs., leaving the construction from 8 to 10 per cent. lighter.

In the course of the discussion which followed the reading of the paper Mr. Dugald Clerk said the experiments shown him by Mr. Knight, as conducted in Paris, proved that, in that engine, if one gave petrol equal to giving 100 heat units, he got in the cylinder indications that the proportion he was then working with was 28—that is, 28 heat units were returned in the form of indicated work within the cylinder, and 23 heat units as brake power. The efficiency would be something like 87 per cent. No doubt the system of smooth surfaces possessed a great advantage in running at low speeds, but the tendency was with a more rapid speed to smooth out those differences. Although a cylinder with pockets would be less economical certainly than a cylinder with a smooth face like that, the difference would not be very great at 1,200 revolutions. When Mr. Knight came to test engines of equal compression and equal volume, he would find that at the high speeds with a full load there was not much to choose. When one came to the low speeds there

The Hotchkiss 40-50-h.p. Six-Cylinder Car recently supplied by the London and Parisian Motor Car Company, Ltd., to Mr. E. Donaldson Hudson, making the fourth vehicle he has had of this make.

would be a great deal in Mr. Knight's favour, and that, of course, was a very important point for hill climbing.

Mr. J. S. Critchley said some people had the notion that the Knight motor was going to cause a tremendous revolution, and that the tappet valve was a thing of the past. He did not agree with that. They would see a battle between the valves, and makers who pinned their faith to the tappet valve would not go under without making a bold fight.

Dr. Hele-Shaw, F.R.S., referred to a difficulty which he imagined did exist, viz.—the conduction of the heat. The way in which Mr. Knight had explained what happened was admirable—the extremely practical way in which he had pointed out that it was not a question of conduction, but of convection. He did not think that anyone who had had experience of the effect of rubbing surfaces and of conductivity would fail to appreciate the importance of the way in which that difficulty was overcome. Oil, at the temperatures at which it was working there, was very thin. He (the speaker) had been working with oil a great deal, and there were oils that, although quite thick at ordinary temperatures, became like water at something below a temperature of 150 deg. At that temperature it was extraordinary, when one came to measure the viscosity in a thick cylinder oil, what a great decrease had taken place in the viscosity. That was now rubbed, and he could quite understand why the cooling effect was so perfect.

Mr. W. Watson wished to express his admiration of the engine, not only for the beautiful work of the design, but for the completeness with which it stepped out in an entirely new direction. Not the smallest advantage, from the experimental point of view, was that one could take off the top of the combustion chamber and alter the shape of the combustion chamber at a comparatively small cost, which one could not do with the ordinary build of engine.

The discussion was resumed on Thursday evening.

*Abstract of paper read to the members of the R.A.O. on the 16th inst.

SUPERHEATED STEAM AS APPLIED TO ROAD VEHICLES.*

By E. D. SUGGATT.

THE modern steam plant as used on a motor vehicle differs so much from the old steam engine as to be almost a different form of power. This great difference is due to the fact that the steam is heated to such a high temperature that it becomes a gas, so that its temperature can be reduced without condensation, and the temperature of the steam rather than the pressure is the most important factor in the running of the modern steam car.

Superheated steam can be produced by passing the wet steam from a boiler through a superheating coil placed over the fire, but on most modern vehicles a "flash" or proportionate generator is used. This consists essentially of a length of tube coiled into any convenient form and into which water is fed in proportion to the amount of steam required the time.

It is heated by a liquid fuel burner, whose heat must be regulated to give an even temperature to the steam produced, whatever its amount. The flash generator will not explode, though very high pressures are used, and it does not scale owing to the high speed of circulation. It is much lighter than a boiler of the same power. The controlling of the water and fuel is done more or less automatically and in a number of ways:—

- (1) Fire kept constant and water varied according to the steam required.
- (2) Fuel and water fed in constant proportion and in quantity according to the amount of steam required, the control of this being either by hand or by the pressure of the steam.
- (3) The water controlled by the pressure of the steam and the fuel by the temperature.

The March of the Motor.

An everyday scene on a fashionable highway outside New York, where the water-car is almost the solitary horse-drawn vehicle.

Where a boiler is employed, the fuel is controlled by the steam pressure, and the water level either by hand or by a special thermostat. A boiler has to have a water level gauge, which is quite unnecessary with a flash generator.

The burner is a most important part of a steam car, as on it depends the smokeless combustion of the fuel under all conditions.

The burners used on motor vehicles are all of the vaporiser type, burning either petrol or paraffin vapour, generated by their own heat. They are of two types, the Hæcla or blow-lamp type and the induction type, in which a mixture of air and vapour is made in the burner body before combustion, by the injector action of the jet of vapour.

Having considered the generation of the steam, we come to the engine. With certain modifications an ordinary double acting engine can be used, but the glands, which are an essential feature of double acting engines, give trouble, and the slide valves are very difficult to lubricate at high pressures and temperatures. Another disadvantage of a double-acting engine is that the least slackness in the connecting rod bearings causes a knock. These troubles disappear, however, with a single acting engine and mushroom valves, similar to a petrol engine. Very high pressures and temperatures can be used without scoring the valves or blowing the glands. The mushroom valves give better distribution of the steam, and all the parts being in constant thrust, there can be no knocking whatever wear takes place. The only possible source of trouble with these engines is the possibility of steam leaking into the crank case and interfering with the lubrication; this has, however, been overcome by a special piston which allows leakage steam to escape into the air.

* Digest of a paper read before the Graduates' Section, London Branch of the Incorporated Institution of Automobile Engineers, on Tuesday, October 20th, 1908.

The use of compound engines, in which the steam, after leaving the high pressure cylinder, is further expanded in a larger cylinder, would apparently be desirable, and in one car a compound engine is used. It is found, however, that equally good economy can be obtained by using simple engines, and utilising the waste heat of the exhaust to heat the feed water (by means of a feed heater or recuperator-condenser).

The advantages of steam are, briefly, silence, flexibility, self-starting of engine, no change-speed gear, greater speed on hills, and no electricity. A steam car is also cheaper than a petrol car of equal capabilities both in first cost and upkeep. A petrol engine is usually considered to be much lighter than a steam plant, but this is not so, as the following figures will show:—

WEIGHT OF COMPLETE POWER PLANT.

| Steam. | Petrol. |
|-----------------------------|---|
| White, 45-h.p., 643 lbs. | Napier engine, 40-h.p. six-cyl., 681 lbs. |
| E.J.V.R., 45-h.p., 695 lbs. | Renault engine, 44-h.p. four-cyl., 706 lbs. |

THE LIABILITY OF MOTOR-BUS COMPANIES.

IN the King's Bench Division of the High Court of Justice two cases have been heard before the Lord Chief Justice and Mr. Justice Walton in which the Vanguard Motor-bus Co., Ltd., was the defendant.

In the first the plaintiffs were Messrs. Isaac Walton and Co., Ltd. It was an appeal from the decision of the deputy judge of the Bloomsbury Court. The action was brought by the plaintiffs to recover damages from the motor-bus company for injury done to a standard lamp erected on the footpath in front of the plaintiffs' premises, with which one of the defendant's omnibuses collided. The centre of the standard was some 14½ in. from the edge of the kerb, and it was struck at a height of 8 feet from the ground, the standard being broken at a height of 5 ft. 6 in. from the ground. Upon these facts the deputy county court judge non-suited the plaintiffs upon the grounds (1) that there was no evidence of negligence on the part of the defendants, and (2) even if there were such negligence the plaintiffs were not entitled to recover, because they had not shown that they had any right to erect the standards on the footpath. From this decision the plaintiffs appealed.

The second case was an appeal from the decision of the judge of the Westminster County Court. An action was brought by the plaintiff to recover damages for injury done to a standard lamp belonging to him, which stood outside the Holborn Music Hall, as the result of the motor-bus belonging to the defendants skidding into it upon a day when the roads were greasy. The county court judge found that the omnibus in question was duly licensed and that the driver was guilty of no personal negligence; that it was a well-known fact that in certain conditions motor-omnibuses were liable to skid, and that when they did so it was impossible to control them. In these circumstances he held that the defendants were liable for placing a nuisance on the highway and for negligently using the highway, and gave judgment for the plaintiff. The defendants appealed.

The Lord Chief Justice, in giving judgment, said in the first case he thought the appeal must be allowed. It was not proved as part of the plaintiff's case that there was any abnormal skidding or exceptional circumstances which made the omnibus come against the lamp-post. They had this fact, however, that a vehicle which, in ordinary circumstances, confined itself to the roadway, knocked down a permanent structure on the pavement. In his judgment, that was evidence upon which a jury might come to the conclusion that there was negligence on the part of the driver of the vehicle. The appeal in the first case must, therefore, be allowed, and the case sent back for a new trial. The second case raised a different point. It seemed to him that, in the face of the findings of the county court judge, they could not interfere. If they were correct findings of fact, he did not think that there was any doubt that the defendants had placed a nuisance on the highway. It was right and fair to the county court judge to point out that he did not base his judgment on any other ground, because he specifically said that there was a negligent use of the highway, not of the motor-omnibus. He based his judgment on the fact that the defendants placed a nuisance on the highway. He (the Lord Chief Justice) desired also to point out that there was an express finding in his judgment that the driver was not guilty of personal negligence. In other words, he could not by the exercise of reasonable skill have avoided what happened. For the reasons he had stated, he thought the appeal in the second case must be dismissed with costs.

THE CAST IRON BRAZING COMPANY, of Station Street, Stratford, E. are repairing anything that is in cast iron, notably broken cylinders or jackets.

OWING to the increasing demand for Avon tyres the manufacturers, the Avon India Rubber Company, Ltd., of Melksham, Wilts, have found it necessary to establish a London depot at 35, Long Acre, W.C. The building, which is a new one, consists of five floors and has been specially erected for the Avon Company. The show rooms are now open, and London motorists can inspect and obtain Avon tyres from this address. Amongst the orders recently secured by the firm may be mentioned the War Office contract, an excellent recognition of the merits of these tyres.

CASES AGAINST MOTORISTS.

CHARGE AGAINST A MOTORIST.

At Bow Street, John Hesketh Pearson, an engineer, living at Brighton, was charged on the 15th inst., before Mr. Curtis Bennett, with the manslaughter of an old man, named James Talbot, who was knocked down by his motor-car in Parliament Street, and was again remanded on bail. Mr. Muskett, who appeared for the prosecution, said that although a coroner's jury had returned a verdict of "Accidental death," the Commissioner of Police had decided, in view of the importance of the matter from the public point of view, to lay the facts before the magistrate, in order that he might decide whether the defendant should be sent for trial. Mr. Harry Wilson, solicitor, said that Mr. R. D. Muir, who had been instructed by him for the defence, was unable to be present that day. The case was adjourned till Tuesday, when the accused was again remanded on bail.

MOTOR CAR V. CAB.

Sir Philip Grey-Egerton, of Oulton Park, Tarporley, sued Messrs. James Lovell and Sons, jobmasters, New Church Street, Camberwell, in the Lambeth court recently to recover £20. damages for injuries said to have been caused to his motor-car. Sir Philip's chauffeur stated that whilst the car was standing on the incline leading to the main departure platform at Waterloo, one of the defendants' cabs was driven up behind, and the shaft smashed through the back of the motor. The defence was that the motor-car ran into the cab backwards. Judgment was entered for the plaintiff, his Honour assessing damages at £14. Stay of execution was granted that application for a new trial might be made.

DRIVERS SENT TO PRISON.

At Bow Street (London) Police Court, on Saturday, Charles Formage, 23, a French subject, was charged with being drunk while in charge of a motor-car, and was sentenced to one month's hard labour without the option of a fine.

At the Westminster Police Court, on the same day, George Goldsmith, of Hammersmith, driver of a motor-cab, was charged with driving in a manner dangerous to the public whilst drunk. Mr. Horace Smith said it was his inflexible rule to send to prison any drunken driver of a motor-car endangering the public. The prisoner must go to prison for one month with hard labour.

THE BENEFIT OF THE DOUBT.

Before the Guildford County Bench, on Saturday, Mr. S. F. Edge was summoned for having driven a motor-car at Witley on September 20th at a greater speed than twenty miles an hour. P.s. Pyke stated that the speed of the car, which came from the direction of Godalming, was equal to thirty miles an hour. The defendant told the witness that he could not be going at that speed, because he had been warned of the police trap, and he drew the witness's attention to the speedometer, the red hand of which pointed to "19." The defendant said that showed his highest speed. Superintendent Jennings informed the defendant that when the same car was stopped three weeks before and the speed was then over thirty-two miles an hour the hand of the speedometer registered the same—namely, under twenty miles. P.c. Edwards gave corroborative evidence. Mr. Edge, in his evidence, said he was going five or six miles an hour slower than the car in front of him. He was a good judge of speed and was not going at even twenty miles an hour. When he pulled up, the constable told him that he did not know whether it was his car or the yellow car in front that was wanted. John Attwood deposed to testing the speedometer and to finding it three seconds out. That was insufficient to describe it as an inaccuracy. The Bench considered that there was a doubt and dismissed the case.

BATCHES.

Several cases against motorists have recently been heard: at Torpoint (4), Malton (5), Epsom (5), Arundel (3). Steyning and the usual places familiar to our readers.

THE EXECUTION OF ORDERS FOR CARRIAGE WORK.

Before Mr. Justice Darling, in the King's Bench Division of the High Court of Justice, on Saturday, Mr. Max Graddon sued the British Motobloc Syndicate, Ltd., from whom he claimed £79 12s. 6d. for building and fitting a phaeton body to a chassis of a motor-car. The principal point in the defence, raised in an affidavit, was that the work at the time of issue of the writ was incomplete, it being alleged that some fitting of the brass beading round the front and back seats was not done. Dealing with the evidence, his Lordship said he was satisfied that the work was finished and the car was ready for delivery at the time in question. He gave judgment for the plaintiff for the amount claimed, with costs on the High Court scale.

THE NEED FOR ACCURACY IN REGISTRATION.

At Rye Borough Bench, on Monday, before the Mayor, Edward Montague was summoned for not having a registration number on his motor-car at Rye, on September 23th. P.s. Verrion stated that the car had plates on the back and front numbered 194L3, which defendant said was his French number. He (defendant) landed in Newhaven on August 1st and had been down there about a month. He got his London number out from the back of the car; that number was LB6127. Superintendent Bristow said that inquiries in London showed that defendant had registered and the car was described as blue. Defendant told the Bench that he had always been under the impression a French car was entitled to travel for a time in England without having an English number—three months he understood. He applied to the London County Council for an English number and said that his car

would be blue, because he intended having it painted that colour. The Superintendent stated that it was important that cars should be properly described, because so much turned in a case of identification as to the colour of a car that was seen bearing a certain number, which would throw the blame on an entirely wrong person. Fined 20s. and 10s. costs and his licence was endorsed.

F.I.A.T. COMPANY v. THE "BIRMINGHAM DAILY POST."

THE action brought by the F.I.A.T. Company against the proprietors of the "Birmingham Daily Post" for libel in respect to certain statements published in their newspaper at the end of 1907 came up for hearing in the High Court, King's Bench Division, on Wednesday of last week. The company's object in instituting the action being to counteract as far as possible the injury done to the firm and the F.I.A.T. Company, of Turin, by the publication of the statements referred to rather than to obtain heavy damages, they agreed to settle the case on payment of £100 and costs, Mr. Eldon Bankes, K.C., on behalf of the defendants, withdrawing the statements made, and expressing great regret at having published what was found on inquiry to be absolutely without foundation.—The directorate in Turin was considerably strengthened at the annual meeting in August last by the addition of the chairman of the Bank of Italy, and directors of two others of the leading banks in Italy. The position of the F.I.A.T. Company, of Turin, is therefore stronger than ever, and their financial status beyond all question. We are informed that nearly 3,000 men are now employed at the factory, and very large orders are in hand.

Touring in India.—A 10-12-h.p. Coventry Humber passing a native bullock cart in a suburban street near Madras.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

THE STEPNEY SPARE WHEEL COMPANY, LTD., will hold their second annual meeting on Tuesday next, when the directors will report a profit of £26,060 after allowing for depreciation, &c. This, with the sum of £2,432 carried forward from last year, will allow a total dividend of 20 per cent. for the year, 15 per cent. to be written off the patent rights, £1,000 off goodwill, and a balance of £4,300 to be carried forward. The German branch has made steady progress, and arrangements are being made to establish small works in Canada. Patent rights have also been assigned for Turkey, Roumania and other eastern countries, and the position of the company is being strengthened in the United States of America. Reference is also made in the report to the show-rooms and workshop that have been opened at 168, Great Portland Street, London, W., where the new flange for facilitating the attachment of a Stepney wheel can be put on to the cars of customers.

WILLINGDON MOTOR COMPANY, LTD.—Registered, with a capital of £7 in £1 shares, to carry on the business of omnibus proprietors, carriers of passengers and goods, &c., between Eastbourne and Willingdon. Private company. Registered office: Barclay's Bank Chambers, Terminus Road, Eastbourne.

FROM the Stella Motor Company, Ltd., 18, Regent Street, S.W., comes a copy of the new catalogue of the Stella car. The vehicle, which is fitted with a 16-20-h.p. four-cylinder engine, 90 mm. bore by 120 mm. stroke, is claimed to have a very low petrol consumption and to be very light on tyres.

FORTHCOMING EVENTS.

OCTOBER.

24th (Sat.).—Motor Parade and Gymkhana of the Blackpool and Fylde District M.C. at the Agricultural Show Ground, Blackpool.

Conference of provincial clubs at Birmingham to consider the question of affiliation with the central motoring organisations.

29th (Th.).—Paper by Mr. Wicksteed on "Change Speed Gears," at R.A.C.

31st (Sat.).—Run of the Birmingham M.C.C. to Harrington Hall.

NOVEMBER.

3rd (T.).—Hull and East Riding A.C.C. Annual Dinner.

6th (F.).—Invitation Smoking Concert of the Stanley Cycling Club at the Queen's Hall, London, W.

11th (W.).—Prof. B. Hopkinson, at Institution of Automobile Engineers, on "A Complete Test of a Modern Petrol Engine."

13th-21st.—Olympia Motor Show, London.

14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club, Hotel Metropole, London, S.W.

18th (Wed.).—Annual Dinner of the Motor Union.

20th-28th.—Stanley Show at the Royal Agricultural Hall, London, N.

26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.

28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

13th (Sun.).—Closing day of the Paris Salon.

23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

JANUARY, 1909.

22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.

26th.—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

War Office Fourteen-days' Trial for Light Tractors.

LIGHTING-UP TIMES—LONDON.

| | | | |
|----------------|-------------|-------------|-------------|
| Oct. 24th—5.48 | 26th—5.44 | 28th—5.40 | 30th—5.36 |
| " 25th—5.46 | " 27th—5.42 | " 29th—5.38 | " 31st—5.34 |

To find the approximate lighting-up time in October for Birmingham 6 minutes should be added to the above times, 2 for York, 8 for Manchester, and 14 for Glasgow.

COMMERCIAL MOTOR USERS' ASSOCIATION.

At the meeting of the executive committee of the Commercial Motor Users' Association, held last week, it was reported that the engineer of the South-Eastern Railway Company had promised a list of the bridges on which notices had been placed limiting the weight of heavy vehicles allowed to pass over the same.

It was decided to suggest to the authorities of the City of London that in future the returns for the accidents caused by motor vehicles be sub-divided under different headings, viz., cabs, omnibuses, petrol vans, steam vehicles and tractors, private motor-cars and tramways.

The membership has now reached 310, the latest accessions being the following firms:—J. Greenwood and Sons, Ltd. (Huddersfield), Aylesbury Brewery Company (Aylesbury), Desmond Motor Company (Liverpool), Wall Paper Manufacturers, Ltd. (Chiswick), Evan Cook's Depositories, Ltd. (Peckham), H. W. Thompson (Fulham), T. Hickling (Leicester), Wm. Verity (Manchester), Oaklands Bros. (Barnsley), Mann, Crossman and Paulin, Ltd. (London).

POLICE "CONTROLS."

ON a good stretch of road between Barnsley and Redbrook the police have a timed distance.

THE police have a long distance trap of 5 miles 220 yards between Newhaven and Brighton which is in frequent operation.

THERE are measured distances at several points of the main roads outside Wakefield.

POLICE officers are timing motorists on the Malton and Scarborough main road.

THERE is a measured half-mile at Garelochhead, Dumbarton.

SUPERINTENDENT BRISTOW told the Rye borough magistrates on Monday that the chief constable had a party of men in the district timing motor-cars, and if any excess of speed was detected the cases would be brought before the magistrates.

As an instance of how well a speedometer can serve the motorist the following extract from a letter to Messrs. Gamage, Ltd., will be of interest:—A police trap was laid on a mile of public road here (Perthshire) which led to a local chauffeur being reported for exceeding the limit. On examination of his speedometer he was confident the mile was short, and at once challenged the accuracy of the distance. The "mile" was measured by one of the District Road Surveyors and was found to be deficient by 218 yards. There were no further proceedings taken." This evidently confirms the instance reported in the *M.C.J.* this week.

ROAD REPORTS.

BRIGHTON.—The Brighton Corporation is endeavouring to borrow £8,816 for the re-laying of the King's Road with tar macadam.

CLAYTON.—The Clayton (Sussex) Parish Council is endeavouring to secure a speed limit of ten miles an hour for the bottom of Clayton Hill.

MOTOR ROADS.—The President of the Local Government Board having been asked whether he would consider the possibility of utilising some portion of the unemployed labour now available upon the construction of motor roads throughout the country to accommodate the growing motor traffic, has replied that "Parliament has not authorised the construction of any roads for the exclusive use of motor traffic. In the absence of the legislation necessary to give such authority, I am afraid," the right hon. gentlemen proceeds, "it would not be practicable to adopt the suggestion in the question."

AUTOMOBILE ACCIDENTS.

LATE on Saturday night a fatal motor-car accident occurred at Cull-nall Green, near Droitwich. Mr. Nicholls, a partner with Mr. Heath, motor-car agent, of Birmingham, was driving in company with Mr. Broome, jun., of Areley Court, near Stourport, and Mr. Dunn, of the Royal Hotel, Droitwich. A dense fog prevailed, and, apparently owing to this, a wrong direction was taken and the motor-car ran up a steep bank and overturned. Mr. Nicholls was killed on the spot. Mr. Broome suffered injury to his spine, and was for several hours unconscious, and Mr. Dunn sustained a broken thigh and other injuries. The victims of the accident remained undiscovered for a considerable time owing to the fog. When at last they were found they were taken to the Royal Hotel, Droitwich.

AN accident, which resulted in the almost instantaneous death of a soldier, occurred at Brook Street Hill, near Brentwood, Essex, on Sunday afternoon. Shortly after one o'clock Mr. Montefiore Mendelssohn, of London, was driving a motor-car towards Southend. When approaching Brentwood a cyclist turned out of a lane into the main road. He went into the centre of the road and was then caught by the car, which threw him from his machine and he sustained a fractured skull. Death took place within a few minutes. At the inquest on Tuesday the jury returned a verdict of "Accidental death," exonerating the motorist from all blame.

LORD NORTHAMPTON was in his motor-car on Monday evening when the car ran into a herd of cattle just outside Danstable. The car fell thirty feet down an embankment and was wrecked. Lord Northampton escaped with a severe shaking, but the driver was found under the car. The occupants of a passing taxi-cab rendered assistance, and his lordship and the driver were taken to Danstable, where it was found the latter had a broken rib.

BUSINESS NEWS.

IN the Chateau Thierry hill-climb, held on Sunday last, the "Four-Inch" Darracq scored yet another notable success, being first in the 96-100 mm. class. It also made fastest time of all cars carrying four passengers. In the 111-120 mm. class a Darracq car was also first.

THE Motor Radiator Manufacturing Company conducted a series of comparative efficiency tests of two cellular type motor radiators on Thursday, last week, at their works in Bermondsey, to demonstrate the efficiency of their system of construction.

MR. W. WATSON, the driver of the winning car in the Four-inch Race, has written to Messrs. Easton and Melville, Ltd., stating that he has "much pleasure in informing you that I used your 110 lubricating oil throughout the Four-inch Race, and in practising, and it gave entire satisfaction. When the great and continuous piston speed is taken into account, I think it proves conclusively that the oil must have been a perfect lubricant."

THE partnership subsisting between Messrs. George Henry Wait and Christopher Brooks Warner, carrying on business as cycle and motor-car manufacturers at 42, London Road, and at Belgrave Gate, Leicester, under the style or firm of G. H. Wait and Co., has been dissolved by mutual consent. All debts due to and owing by the late firm will be received and paid by Mr. G. H. Wait, by whom the business will in future be carried on under the same style.

MESSRS. SHIPPEY BROTHERS inform us that they have disposed of their sole agency rights for Lancashire, Yorkshire, Cheshire, North of Wales, and the Isle of Man for the sale of their "Chemical Decarboniser" and "Decalcifier" compounds, as used for removing carbon deposits from the cylinders and incrustations from the radiators and water jackets of motor-car engines, to the Motor and Gas Engine Decarbonising Syndicate, of 47, Marlborough Street, Liverpool, to which Messrs. F. H. Hornblower and Co. have been appointed managers. We learn that the syndicate is arranging to establish official agencies in the leading commercial centres, such as Manchester, Leeds, Sheffield, Blackburn, Hull, and other approved districts, where a stock of these specialities will be kept. Messrs. Shippey Brothers state that the wholesale trade in these specialities is largely extending and that they are receiving many repeat orders and testimonials from satisfied users as to the successful working of the compounds. We also learn that the Scotch and West of England rights, also the Birmingham and Midland concessions, are under negotiation with other well-known engineering firms.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, OCTOBER 31, 1908.

[No. 504.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

IT was a horrible picture of desolation that was drawn at the Guildhall, London, on Tuesday, by the ducal orators who assailed the motor-car as a formidable engine of destruction, and the man who drove it as a selfish and iniquitous person. Apparently those who drive cars are callous about "shaving" pedestrians—according to His Grace the Duke of Northumberland—and the only way to inculcate the spirit of toleration will be to give the magistrates power of confiscating cars, without compensation and for a time limit of six months. Lord Willoughby de Broke did not consider all the trouble had arisen from the inconsiderate motorist. It was partly owing to the fact that people had tried to introduce a form of traffic which the roads were never intended to carry, and to drive that traffic at a speed wholly inconsistent with the safety and comfort and common law rights of the peaceable enjoyment of the roads by the people of this country. A resolution calling on the Government to introduce new legislation was adopted on the motion of Mr. Harold Cox, who regretted the cautious attitude of Mr. Burns, and declared that the bare facts relating to motor-car matters were refused by the journals of the day. Mr. Cox has been a contributor to newspapers often enough to know that public interests are the first concern of those responsible for the conduct of the press.

The Scottish Trial.

ALTHOUGH our recent Symposium on the Trial question revealed the fact that the trade as a whole did not desire a repetition of the 2,000 Miles Trial, which proved such a lengthy and costly experiment this year, there was a feeling evidenced in favour of regarding the Scottish Trial as a useful and authoritative test for the reliability of motor vehicles. Hence considerable interest attaches to the announcement that we are now able to make to the effect that the Trials Committee of the Scottish A.C. are recommending to the General Committee of that organisation that the Scottish Reliability Trial in 1909 should comprise 1,000 miles. The committee is further suggesting that the event shall take place during the week beginning June 14th, and as soon as the sanction of the General Committee has been obtained will get to work upon the regulations.

1,000 Mile Trial.

MR. MARK DAVIES, of Shrewsbury, recently left the town with a friend on a 1,000 miles tour. Starting from Shrewsbury on his 10-12-h.p. Darracq car, they journeyed to Hereford, Ross, Gloucester, Bristol, Weston-super-Mare, and Bridgwater. From the latter place they made a start for Minehead and Porlock, up the steep winding ascent from Porlock, and down what is perhaps the worst road in England for gradient and a broken surface, to Lynmouth. Then up the precipitous and tortuous road that leads to the cliffs above Lynton. The

next stop was at Ilfracombe, from which the way was made through Woolacombe and Barnstaple to Bideford and Clovelly. They then journeyed back more inland to South Molton, Bampton, Wiveliscombe, Milverton, and Taunton to Bridgwater, Dorchester, and Bournemouth. The roads there were on the whole very bad, having several inches of dust on them. Next day they travelled on to Lymington and Brockenhurst, and through the New Forest to Southampton, which was a beautiful run and an excellent road. Crossing to the Isle of Wight and seeing the island occupied a day. Leaving there they journeyed to Portsmouth by boat, and back thence to Southampton. Next day they visited Winchester, then went on to Salisbury, and crossed to Bridgwater again. The following day they went to Glastonbury, Wells, Bath, and Stroud, thence to Tewkesbury and Malvern, and next day did Worcester, Kidderminster, Bridgnorth, and home to Shrewsbury. Save for three tyre troubles they had no involuntary stop in the whole of a 1,000 miles tour.

The Making of Roads.

INAUGURATING a new reservoir at Molesey for the Metropolitan Water Board on Saturday, Mr. John Burns had something to say to those responsible for the great main roads of the country. Last year no less than £14,000,000 was spent on the highways and bridges in Great Britain alone. According to most authorities the proper time to make a road is between October and March, but, unfortunately for the organisation and regulation of labour, many local authorities undertake such work at a time when the harvest is demanding all available manual assistance. The President of the Local Government Board therefore suggests that the greater portion of the money which is spent on such work, in which motorists are naturally interested, should be used in the slackest months of the year, from next month until the spring. This is being done in many leading counties, and is a subject to which the provincial clubs might well give their attention.

Gauging Speeds.

THERE is much practical common sense evidenced in the experiment carried out at a recent week-end by the Skipton Urban Council in connection with judging the speed of motor-cars. In discussing the recommendation the local authority shall make to the West Riding County Council as to speed limits through the town some of the members urged that six miles an hour should be the limit, while the chairman and others favoured eight miles an hour—this being the limit suggested by the local bench of magistrates. It was contended by the advocates of eight miles only that the ordinary observer could not judge to several miles an hour the actual speed a car was travelling, and to put the matter to test a series of eight runs was carried out along High Street. The results were interesting. The first run over a measured distance showed a registered speed of nineteen miles an hour. The nearest estimate was 15, and the lowest 5; second run—actual 10 miles an hour, nearest estimate 7, lowest 4; third run—actual 25, nearest estimate 20, lowest 12; fourth run—actual 16, nearest estimate 12, lowest 6½; fifth run—actual 10, lowest 5; sixth run—actual 5, correct estimate 5 in five individual cases; lowest 3; seventh—

run—actual 30, correct estimate 30 in three cases, lowest 18 ; eighth run—actual 22, nearest 20, lowest 14.

In the West Riding.

AT the meeting of the West Riding County Council the chairman of the Highways Committee reported upon the opinions of local authorities which had been obtained since the issue of the recent circular by the Local Government Board. These suggested that no fewer than 258 lengths of road should be prohibited to motor traffic and that the speed of motor-cars upon 1,024 roads and portions of roads should be restricted to rates varying from four to fifteen miles an hour. Out of 148 local authorities which had been consulted, 121 have expressed some desire for restriction. The Highways Committee were, however, not inclined to recommend the County Council to ask the L.G.B. for the imposition of any further regulations restricting speed within the West Riding area. But this recommendation was referred back by forty-four votes to three, and the committee is now expected to reverse its original decision.

Touring in Switzerland.—A Snapshot from Adliswil, near Zurich.

The Manx View of the T.T. Race.

HAVING in the last few issues set forth the views of competitors in the Tourist Trophy or Four-Inch Race in the Isle of Man as to its influence on the design of cars, we are now pleased to be able to give the opinion of the President of the Manx Automobile Club with regard to the local effect of the contest. Mr. George Drinkwater, whose 18-h.p. Motobloc bears the registration No. 1 on the island, believes that the races have undoubtedly had a stimulating effect on the residents, for there are now more than 100 motor-cars and motor-cycles on the island—a large number for a comparatively small place, whilst—and this is a piece of information which the trade will appreciate—more orders are about to be placed. "The actual race," continues Mr. Drinkwater, "taught Manx motorists little beyond showing the control exerciseable over the swift-moving machines, the power, especially up hill, that can be obtained from a four-cylinder, and, perhaps more than anything, the strain and rough usage that a modern motor can stand. The wear and tear on the roads was slight except where brakes were put on and at bends and corners. The organisation of the race was perfect, but the Manx Automobile Club—who had duties assigned to them—do not contemplate contests on the same scale. The T.T. races have unquestionably educated the

horses and their drivers, also children not to try 'last across,' and generally the Manx people are not hostile to motors, as was the case a few years ago. The majority like the races from their inherent love of sport and because of the grist that comes in with the competitors and spectators, and as a consequence the races have a tendency to check the feeling of resentment against motorists that unfortunately is noticeable elsewhere." It is evident, therefore, that so long as motorists on the mainland want races the roads of the Isle of Man will be available.

Motorists and the Territorials.

FROM the Lincolnshire A.C. we have received particulars of their scheme for the registration of owners of motor-cars willing to lend assistance in connection with the mobilisation of the Territorial Force. This has the support of the commanding officers of the two infantry battalions of the county, and it is not intended to trench on the province of the Army Motor Reserve, whose duties, it should be noted, are of an entirely different nature. On the order to mobilise being given, the point of concentration will be named, and troops transported there as rapidly as possible. The railways will probably be occupied to their fullest capacity with the transport of guns, ammunition and also regular troops from beyond the county. It is suggested, therefore, that the Lincolnshire owners of motor-cars should assist by placing at the disposal of officers commanding units of the Force in the Fen country motor-cars, so that as many men as can be conveyed at once to the point required would have headquarters assigned to them. It is estimated that an average motor-car could carry three or four soldiers with their arms and equipment, and if the distance was not too great, two or more journeys could be made. In this manner twenty automobiles would be able to transport a company (117) to a distance of, say, fifty miles within twelve hours. The committee of the Lincolnshire A.C., having regard to the good service that could thus be rendered to the military authorities, are inviting owners of cars who are not engaged in the military service in any other capacity to allow their names to be enrolled as willing to assist the conveyance of troops to the points of concentration.

Signalling by Handkerchief.

IN the court at Mortlake an interesting incident occurred on Wednesday, when a driver of a motor-car who had been "trapped" challenged the accuracy of the police method of signalling by handkerchief and setting their watches on receiving the warnings. He asked for a test in court, and, although the inspector demurred to such procedure, the Bench rightly allowed the defendant the opportunity of demonstrating the uncertainty of human signalling. He had been timed over a 220 yards measured distance; in court the constables were only a few yards apart and were half a second out in ten seconds—sufficient to prove that there was a reasonable doubt when similar methods are pursued on the road. Such points should always be contested, and, although they may not be appreciated by the police, they will tend towards caution in summoning motorists.

Motor Cars and Roads.

AT a time when so many county surveyors are denouncing the motor-car for its ravages upon their highways, it is interesting to come across the report of Mr. C. S. Morris, the county surveyor for Northamptonshire, whose roads were recently the subject of most favourable comment by Prince Francis of Teck after H.S.H. had travelled over many miles of them. Mr. Morris's opinion is that the alleged damage to the roads by fast-travelling light motor cars is much exaggerated. At the same time he does not deny that heavy vehicles and those with steel-studded tyres have damaged the roads, but not to the enormous extent which is generally assumed. The county surveyor for Northamptonshire holds no brief for motorists, but,

after inspecting the damage to the Watling Street road several times during the past year, finds that only about one-fifth of the total length shows evidence of damage to any extent. There is also evidence of injury on the Northampton and Market Harborough road, but, apart from these two instances, he has little to complain of so far as fast-travelling motor-cars are concerned, and comes to the definite conclusion that "the total damage in this county is at present not sufficient to materially affect the cost of maintenance."

Four Policemen to one Motorist.

It seems better that murders may be committed, and the murderers allowed to remain undiscovered, rather than that one motorist should be allowed to escape persecution. On Saturday last, a correspondent writes, he was proceeding along Castelnau Road, Earnes, at about twelve or fourteen miles an hour, when a policeman stepped off the path and stood in front of the car, not more than two yards off. The vehicle was immediately pulled up, and, although the roads were exceedingly

Speed in the Fen District.

At a meeting of the Spalding Rural District Council a resolution urging the Government to deal with the excessive speed of motor-cars has been adopted, with only one gentleman, Mr. Richard Gleed, a motorist, protesting. Mrs. Royce, of Donington, whose husband is a prospective Parliamentary candidate for the Division, as well as the owner of a car, said her experience of automobilists was that when they got out of their own district they were often reckless as to speed—a remark that may raise some comment from those who are in the habit of touring at any distance from their own place. The fact is that the sense of responsibility requires to be fully emphasised wherever possible; and there is no doubt that in Lincolnshire a great deal of harm was done a few years ago by cars racing along the fine level roads of the county. This prejudice, is, however, being worn down by the Lincolnshire Automobile Club, which is doing much useful work in encouraging the considerate driver. We have often noticed that cars bearing trade numbers are the greatest sinners in this respect, and

The Chateau-Thierry Hill Climb.—The Scene near the Starting Point.

greasy, the car did not skid in the slightest degree when the brakes were applied. Two plain-clothes men afterwards came up and said our correspondent was travelling at the rate of thirty miles an hour. To prove this they showed their watches, which tallied to the exact second, despite the fact that the men were stationed a furlong away from each other and there was traffic on the road and foot passengers on the path. The usual information was given that a summons would follow. On the Sunday morning, our correspondent further informs us, a constable went to the garage before 9 o'clock in the morning to verify the address, although it was on the licence; then a SECOND officer came and said a mistake had been made in copying the licence; later a THIRD called with the interesting information that he would be summoned; and finally a FOURTH duly served the summons. The above, without comment, must cause reflection in the minds of our readers, and suggest the uses to which our police force are put. Apparently it is not for the purpose of protecting either persons or property, but chiefly to harass and endeavour to kill an industry employing tens of thousands of hands.

would urge upon firms in the industry the necessity of insisting that their employees should always drive with care and caution.

A MOTOR first-aid machine has recently been supplied to the Fire Brigade of Southampton by Messrs. Merryweather and Sons, Ltd. The vehicle, which is fitted with a 55-h.p. petrol engine, has accommodation for about half-a-dozen firemen and is provided with a fifty-gallon chemical tank.

"THE Story of a Midland Town" is a well-printed quarto publication compiled by Mr. Thomas Adams and issued by the Wolverhampton Industrial Development Committee. The illustrations and letterpress are well calculated to cause manufacturers who are thinking of removing their establishments from heavily-rated areas to consider the terms and conditions prevailing in this town of 95,000 inhabitants, where it is calculated that rent and prices are 18 per cent. less than in London, while coal is 40 per cent. cheaper. In proximity to Wolverhampton are several delightful suburbs, while the industries already represented include several automobile firms, one of which is the well-known Star Company.

Motor-Cars of the Future.

WHAT THE PUBLIC DEMAND AND IMPROVEMENTS THE AGENTS SUGGEST.

THE motor trade is apparently in a state of transition; the days of "motoring for motoring's sake" are passing away, and the public interest is now turning from the cars of great power and cost to those of economical upkeep and ability to do the ordinary work of getting quickly and reliably from place to place.

Recognising the unique position of the provincial agent for gauging the present position and observing the course of fashion in the automobile world, we have extended an invitation to some of the leading agents to communicate their views through our columns. We have suggested that the public will be interested in knowing the tendency of the demand for cars, and that the makers would welcome the opinions of agents as to points of future improvement. Thus the symposium serves a two-fold purpose. The replies received to our questions prove an appreciative interest in the matter, and have been so numerous that but a small instalment can be given in the present issue.

Mr. Hubert Egerton, of Norwich, whose firm (Messrs. Mann, Egerton and Co., Ltd.), is well known throughout the eastern counties, writes:—"We should say that, from our experience of Norfolk and neighbouring counties, the average buyer is looking for something about 15 to 20-h.p. To put it more plainly, amongst that class that have the means to go in for a large car, say a 40 or 50-h.p., the tendency to buy such big cars is decidedly on the wane, and a great many from that class, who would two years ago have bought a 40-h.p., would to-day buy something more like a 20-h.p. The greatest number of buyers, we should imagine, at the moment can be found for cars from 14 to 20-h.p. And below that h.p. there is a very large class, consisting of doctors and other professional men who use a motor-car simply as the cheapest means of annihilating distance, and who are not really motor enthusiasts at all in many cases, and whose needs are satisfied with a car of from 10 to 14-h.p.

We would suggest as the two most needed improvements the adoption by all makers of forced feed lubrication through a hollow crank shaft. This system, if properly designed and carried out, from our own experience, we can safely say is infinitely ahead of anything else, both for simplicity, efficiency, and freedom from the host of minor troubles to which the splash system is heir. The second improvement, which would be most advantageous (and this is a matter which has been horribly neglected by the majority of makers) is the fitting of the magneto in an accessible position. We could give the names of any number of different models wherein it is the work of an acrobat to get at the magneto at all. There are some noted exceptions, of course, but still to-day there are a number of makers of renown whose cars are still fitted with totally inaccessible magnetos."

Mr. W. Blues, of Pitlochry, is well known to participants in the Scottish Trials, and suggests that with regard to the type and horse power most in demand there can be no question that the requirement is for 10-12 to 16-20-h.p., with Cape cart hood and wind-screen according to the purse of the owner. "As to the special points of improvement, I think a slightly higher set car, well sprung and roomy in the body, without being too long in the wheel base for turning corners, with a good under screw, easily detached, would be much in demand, live axle-drive being preferred to a chain drive. I think, personally, that the reason for a small car becoming more popular is that people are now getting the full power out of their engines, and the case of a man running for weeks on three-cylinders without knowing it is getting more rare every day."

Mr. G. W. Hodgkinson, of Buxton, notes a tendency in favour of the 10-12-h.p. four-cylinder side entrance light touring car and the 30-h.p. limousine or landaulet. He suggests that

makers should take care to fit tyres capable of carrying the weight and doing the work expected, giving the approximate mileage of the same. It would be also an advantage if the mileage to be obtained per gallon of petrol could be given.

The demand, according to the experience of Messrs. Rock, Thorpe and Chatfield, of Tunbridge Wells, seems to move towards a moderately horse-powered four-cylinder car at moderate price, and they are of opinion that sales are more likely to increase in the direction of 15 to 18-h.p. rather than the more powerful type. For those who require a bigger car a power of 35 to 40-h.p. will give ample satisfaction.

Messrs. W. H. Johnson and Sons inform us that 80 per cent. of the cars they have sold this year range in h.p. from 12 to 18, the average price being £400. Their experience covers a wide area, business being directed from their places at King's Lynn and Hunstanton.

They consider that all cars should have dual ignition and an easy form of change-speed—a "gate," for instance—and above all the makers should adopt as standard a tyre well up to the weight of the car.

Messrs. Stradling and Plenty, Ltd., of Newbury, do not find that any one type, horse-power, or price predominates in their district, but, speaking generally and from their own experience, a car from 12 to 18-h.p. would satisfy most people if it fulfilled the following conditions:—1, it must have a fair turn of speed; 2, must be a good hill climber; 3, must be light on tyres and petrol; 4, must be silent and wear well without requiring constant attention; 5, must be smart looking and comfortably sprung.

"We have suggested in the above some of the desirable features which a car should possess, and think manufacturers should, in addition, aim to simplify gear changing, and improve clutch mechanism; brakes, too, are yet capable of betterment, larger surfaces, and should be internal expanding. A radiator also that was efficient and would not leak would be a godsend."

A "TEN years' constant reader" of the *M.C.J.* suggests that motorists passing through Buxton should remember that invalids go there for treatment. This hint is particularly directed to the many people that attend the hunt in their cars.

MESSRS. A. W. GAMAGE, LTD., are now making the generous offer that they will allow motorists a free use of the fully-charged Sioco tyre inflator. This is obtainable ready charged at the Holborn house, and customers have the free use of the inflator until discharged, when (unless they wish to retain it) the deposit will be refunded in full.

AN attractive catalogue of their high-class motor clothing as well as liveries for chauffeurs reaches us from Messrs. Charles Baker and Company's Stores, Ltd., 137 to 140, Tottenham Court Road, W. At this establishment the firm have a motor clothing depot, in charge of an expert who is practically acquainted with the requirements of those who motor. For the winter season several excellent garments have been produced, including loose overcoats in tweed, frieze or cheviot, and lined with tweed, camel-hair or leather. An excellent speciality is their lined fur overcoat with detachable leather lining. Messrs. Charles Baker and Company, Ltd., have also brought out an "umbrella" waterproof overcoat in drab twill for gentlemen. The ladies' department is replete with serviceable and fashionable raiment, motor coats and costumes having long been a speciality of the firm. In the department devoted to liveries and engineers' clothing there are some good lines in blue and green army cloth and combination suits respectively. The list concludes with a selection of motor caps, motor gloves, and, in fact, everything that is likely to be worn by the motorist of either sex.

THE VANDERBILT CUP RACE.

THE fourth annual contest for the Vanderbilt Cup was held on a 23½ mile course on Long Island, U.S.A., on Saturday last, in the presence of a crowd of spectators estimated at not less than 200,000. The circuit, which took in the recently constituted "motor parkway," which is nearly 11 miles long, had to be covered eleven times, making a total distance of about 258½ miles. Until quite recently it appeared as though the contest would be confined to American machines, for, though the Vanderbilt competition had in previous years been the only motor race of importance in the United States, this year the Automobile Club of America is promoting an international contest for Grand Prix cars, and there was some antagonism between the organisers of the two events. A settlement was arrived at only by the Vanderbilt Cup Commission agreeing to make the

Robertson's average speed for the 258½ miles is equal to just over 64 miles per hour. Most of the drivers met with tyre troubles, while great difficulty was experienced in keeping the crowd off the track. Indeed, after the arrival of Robertson and Lytle at the finishing point the race had to be called off, owing to the spectators crowding on the course.

NO SHORTAGE IN PETROL.

HAVING in view the great increase in motor traffic during the past year or so owing to the large number of motor-buses and cabs that have been put on the streets, fears have been expressed in certain quarters that the demand for petroleum spirit would advance at a greater rate than the supply, and that not only would the price consequently

A View on the Motor Parkway, Long Island, U.S.A., which was comprised in the course for the Vanderbilt Cup Contest.

race a national one. The international element was, however, preserved by allowing foreign machines to run, provided their owners were Americans.

Nineteen cars—twelve American and seven European—were entered for the event, they comprising two Locomobiles, two Knox, a Chadwick, two Mathesons, three Thomas, an Acme, a B.L.M., three Mercedes, an Isotta-Fraschini, a Hotchkiss, a Brasier and a Renault. Of these seventeen actually competed. The start took place at 6.30 a.m., the competitors being sent away at intervals of 30 sec. Robertson on a Locomobile led for the first three rounds, but in the fourth circuit he was passed by Haupt, on the Chadwick, his time being 1 hr. 26 min. 10 sec. On seven circuits, however, Robertson regained first position, and from that point to the finish he was not displaced.

Appended is the result of the race:—

| No. | Car. | Driver. | Time. |
|-------|----------------------|------------------|----------|
| | | | h. m. s. |
| 1 ... | Locomobile ... | P. Robertson ... | 4 0 48 |
| 2 ... | Isotta Fraschini ... | H. Lytle ... | 4 2 36 |
| 3 ... | Mercedes ... | Lutgen ... | 4 30 35 |
| 4 ... | Locomobile ... | J. Florida ... | 4 31 10 |

increase but the very groundwork on which the whole motor movement is based would become insecure. It is gratifying to learn, on the authority of Dr. P. Dvorkovitz, that there is no need for alarm, and that the petroleum refining industry is capable of placing on the market supplies of motor spirit more than sufficient to meet any possible demand for it, especially now that consumers are recognising that heavier grades can be used with equally satisfactory results as the lighter qualities formerly considered necessary. In a letter to the "Times" Engineering Supplement Dr. Dvorkovitz points out that "large as was the demand for spirit during 1907, the total imports for that year have already been exceeded during the past nine months. The various importing firms have laid themselves out to keep pace more effectively with the demand, and only a few days ago the largest spirit cargo on record—over 2,500,000 gallons—was delivered into the storage tanks at Thames Haven. Now that heavier motor spirits are in demand, we see that the oilfields of Grosny (Russia) and Roumania are steadily coming into prominence with their motor spirit, which, in past times, has been precluded simply because the motorist was not aware that they constituted a satisfactory fuel."

THE CARE OF MOTOR-CARS IN WINTER.

SOME SUGGESTIONS.

IN our last issue we dealt at some length with a few of the matters that need attention in connection with motor-cars during the winter season. The remarks then given mainly applied to vehicles which are kept in commission throughout the whole of the year. While there is no reason why all cars, now that front glass screens and Cape hoods, not to speak of covered bodies, are so general, should not be used in the winter as well as in the summer, there is still a small section of the motoring community who, as soon as the cold weather comes, put their vehicles away in the stable only to bring them out again in the spring. Even when a car is to be left to itself for some months some little care on the part of the owner is necessary to put it into proper condition for this period of inactivity; otherwise, when he comes to take it out at the beginning of next season, he may experience unexpected trouble that may be obviated if attention is given to the matters outlined below.

Motor-Cars and Hunting.

Mr. W. P. Brigstocke, of Ryde, Isle of Wight, has sent us the interesting snapshot reproduced above, showing a stag weighing 23 stones he recently took home in his car.

First of all the car, prior to being stored away, should receive a thorough cleaning. Usually the last runs have been over wet and muddy roads and the wheels and the underframe, as well as the body, are covered with mud. It is important that the body and other painted and varnished parts should be washed perfectly clean and well dried before being placed in winter quarters, as, if the mud is allowed to remain through the cold season, it cannot be removed without leaving permanent marks upon the varnished surfaces. The lamps should be thoroughly cleaned out; and it must not be forgotten, also, that acetylene generators contain water reservoirs, which should be completely emptied, otherwise they will be damaged in periods of frosty weather. Removable bright portions of the car, such as the lamps and horn, may be taken off and stored in the house, if desired, and cushions and mats may be accorded the same treatment. The bright exposed portions of the car which cannot readily be removed, such as the operating levers, may be given a light but complete coat of vaseline to protect them from corrosion. The same treatment should be applied to all working parts of the transmission, which should be thoroughly cleaned from all old

oil and the grit and dirt which it contains. Paraffin is best for this work, followed by a coating with the vaseline brush. Even those parts of the chassis which form the outside of the car and are painted to correspond with the body—frame members, springs, the bright parts of the radiator bonnet, and metal fittings on the dashboard, &c., will be none the worse for a coat of vaseline.

If the car is provided with a hood, it is essential that this should not be put away folded down, but it must be erected as for use and all struts and straps tightened to the full, otherwise creasing will take place, and if the hood is of leather, damage may be done by cracking at the folds.

As to the engine, the cylinder should be well washed out with paraffin. This treatment dissolves any oil which may be on the cylinder walls or piston, and which may cause them to stick, and it prevents the oxidation of the oil which may occur if it is allowed to remain. All the lubricators should be drained of any oil which they may contain, and should be thoroughly washed out with paraffin or stale petrol. Where sight feed lubricators are fitted, or other patterns which necessitate the using of lengths of copper pipe to convey the lubricant from its receptacle to the bearings, such pipes should be removed, and should have paraffin passed through them to sweep away any congealed oil. If this is attended to carefully and the pipes are reconnected, one will be satisfied that, when the time comes for the car to be again taken out, all that is necessary for the good working of the lubricating system is a fresh supply of oil.

The water should be drawn off from the entire engine cooling system, care being taken to see that this has been thoroughly done and that none remains anywhere in the pipes, connections, pump or radiator, or serious trouble may ensue in a frosty spell. In order to remove all possible danger from fire, the petrol tank and carburettor may as well be completely emptied. This will wash out most of the sediment which may have accumulated during the season's running, and leave the tank in good condition for next year's supply.

Where accumulator ignition is used the batteries should be disconnected and removed from the car, and great care must be taken to secure their proper preservation. They should be tested, and if found to be below the full voltage (4.4) they should be recharged. The acid should then be poured out from the cells, which should be washed out with clean rain water two or three times so as to remove all the acid, and they should be afterwards filled up with pure clean rain water to a point the height of a quarter of an inch above the top of the plates. The vent plug should then be replaced. While washing out the cells, the terminals also should be carefully washed to free them from all traces of acid; they should then be wiped dry, and given a coat of vaseline as a further protection against their corrosion.

Perhaps the most important subject of precaution, when putting away the machine for the winter, is that of the tyres. In order to relieve them of all strain during their period of inactivity, the machine should be raised clear of the floor a distance of two or three inches and supported on jacks or wooden trestles. The four points of support should be the axles, nearly under the springs, and the supports should not be so placed as to prevent the wheels or any other operating part of the car from being turned. If no suitable trestles are available, wooden blocking will suffice, provided it is secure, with no likelihood of toppling over in case the car is handled. When the vehicle is to remain out of use for several months many motorists deem it advisable to take the tyres off the wheels and keep them well wrapped up in a dry and dark place until they are again wanted.

When the above points have been attended to, a cover of holland or other suitable material should be thrown over the whole machine, after which one may feel that all reasonable care has been taken to ensure a minimum of deterioration.

OFFICIAL representatives of foreign countries not being subject to local law in Washington, the letter "D" is now being placed on cars belonging to members of the diplomatic services of foreign states in America.

GOSSIP FROM PARIS.

NEXT year's Grand Prix will almost certainly be contested on the Anjou circuit. The subscription, to which all the communes through which it passes have contributed, already amounts to over £4,000, and an additional sum of £200 to promote the race on that circuit has just been guaranteed by the authorities of the State and West of France Railways. The cost of the competition will be considerably increased in 1909, because the law of two years' military service, which has now come into full force, precludes the use of soldiers for the maintenance of public order at races, shows, &c. Consequently it will be necessary to employ and to pay other people to keep the public from invading the roads during the event. M. Dupeyrat, the Prefect of Maine et Loire, who was instructed by M. Clemenceau to notify that fact to the A.C.F., was, however, able at the same time to indicate the means to surmount the difficulty created by the absence of the troops. He stated he could promise to place the majority of the 600 road sweepers of his department at the disposal of the Sporting Committee of the A.C.F. for the maintenance of order during the races, as well as a considerable number of gendarmes. In addition to these, the men of the Fire Brigade might be utilised. The Anjou circuit has, however, at least one drawback, without counting its distance from Paris, and that is its shortness. It measures only 75 kilometres 322 metres. Will it be long enough for the increased number of racing cars which, owing to the diminution of the bore of the cylinders, will doubtlessly be entered for it? This year there were nearly fifty cars in the Grand Prix Race, and some people predict that in 1909 the number will be doubled. On the other hand, it would be scarcely prudent to start more than one car per kilometre, which would reduce the maximum number to 74 or 75 at most. Should it be ascertained that the entries are likely to greatly exceed that number, it is possible that manufacturers will only be permitted to enter two cars instead of three for the event, otherwise it might be requisite to have recourse to elimination races, which are not popular.

"We must look out for the Germans, they are ready," was the remark of a French motor-car builder, who was nevertheless delighted at the regulations just fixed for next year's Grand Prix. It is probable the Germans are nearer being ready than the French, and, at any rate, the reduction of the cylinder bore from 155 mm. to 130 mm. is at least a tacit admission on the part of the French that the Germans were in the right when they proposed 135 mm. bore for the last international competition. At next year's Congress the A.C.F. will perhaps have to come down to the English suggestion of 120 mm. bore. It is to be hoped they will, and even the 1909 Grand Prix regulations constitute a step towards a type of vehicle which might be put on sale. However, the length of the stroke being left to the choice of the constructors, the vast majority of the racing cars of next year will in all probability not be such as could be utilised for touring. Moreover, with the reduction of the minimum weight to 900 kilogrammes, the speed will be quite as high if not higher than that attained at Dieppe last July. Consequently, in spite of the reduced weight, the tyres will again play a very important part in the Grand Prix of 1909.

IF matters progress as they are doing at present, aviators will have no reason to complain. During the debate on the Budget the French Chamber will be asked to vote a large sum for the encouragement of aviation. The Aero Club of France has already created a Grand Prix of £4,000 to be competed for in 1909; the National Aviation League has received many thousands of pounds to be offered in prizes; £500 is to be given to the first man who crosses the Channel on an aeroplane; another £500 is promised for a flight over Paris; and £400 will be awarded to the aviator who may first leave the ground at Bagnères de Bigorre and fly to the summit of the Pic du Midi and return to Bagnères. These are only some of the newly-created prizes, to which many others will surely be added before long, to say nothing of the old prizes still remaining to be won, such as that for a flight from London to Manchester, the Michelin

prize for a flight from Paris to Clermont Ferrand, the £800 for the longest controlled flight before sunset on December 31st next, &c. Undoubtedly all these competitions, most of which are international, will stimulate aviators, and the progress in the conquest of the air has within the last twelve months been so prodigious that it would be rash to bet against the winning of any one of the prizes during 1909. It is only a question of motors. If one is found to be reliable, the person or persons possessing it will soon reap a rich harvest. And "it will," as a prominent aviator said to me the other day, "be astonishing if one or more of the numerous manufacturers now constructing light motors for aeroplanes does not succeed in turning out a really first-class article to which a man can trust his life."

THE banquet to be given by the French Aero Club at the French Automobile Club on the 5th prox. in honour of Wilbur Wright will be a grand manifestation. The gold medal of the Aero Club will be presented to the Brothers Wright, because, if Henry Farman first demonstrated publicly that man could fly, there is no longer any doubt that the American aviators flew in private a couple of more years before him, and because the performances of Wilbur Wright at the military camp of Auvours have given an extraordinary impetus to the science of aviation.

Col. Holden and Mr. Mervyn O'Gorman, two of the R.A.C. Delegates to the International Conference.
From a Caricature Sketch [in "L'Auto."]

The French have not bestowed their admiration grudgingly. They would, no doubt, have been yet better pleased if it had been a Frenchman who had made the marvellous flights, carrying passengers with him on his aeroplane, but they have recognised to the full the merits of the foreigner, who will certainly return to his native country with a better opinion of the French nation than he had when he landed in the Old World at the beginning of the summer.

MARNEY.

A CORRESPONDENT at Shanghai reports that at this important Chinese port the motor-car is steadily growing in favour, the number, which at present is about 150, being constantly added to. Owing, however, to the narrowness of the roads and the congested state of the traffic, there have been, and still continue to be, numerous collisions, some of which have been attended with fatal results. Most of the chauffeurs are Chinese, and as a rule are very careful, but if they see anything coming anywhere near them they lose their heads. The tram drivers are all Chinese, and they handle the cars very well on a clear road, but as soon as the traffic becomes congested they become nervous.

CONTINENTAL NOTES.

British Motorists in France.

Recent British visitors to France with their cars include Mr. and Mrs. John Scott (60-h.p. Napier); Mr. and Mrs. W. R. Emmott, London (40-h.p. Siddeley); Mr. Stephens, London (24-h.p. De Dion); and Mr. F. Henniker and Mr. Scully, Birmingham (50-h.p. Charron).

Motorists Forbidden to Splash.

The Mayor of St. Germain, near Paris, has issued a regulation forbidding motorists to travel so fast on muddy days as to splash passers by, and has warned them that gendarmes will be appointed to see that the order is obeyed.

A Novel Garage Fitting.

A somewhat novel fitting has lately been installed in the garage at the rear of the Club-house of the A.C.F. in Paris. In getting their cars ready for work, many chauffeurs give their engines a trial run, generally with an excess of lubricating oil, with the result that heavy clouds of smoke are given off. It was to get rid of this, and to render the atmosphere of the garage much clearer than it usually was, that M. Max Richard, a member of the A.C.F. Technical Committee, devised a combined electric motor and fan. To the suction side of the latter is

The 40-h.p. Military Motor Lorry designed by the Archduke Leopold Salvator of Austria.
(Allgemeine Automobil Zeitung.)

attached a flexible pipe which can be slipped over the outlet nozzles of engine silencers, so that any smoke passing from the latter is drawn away and discharged into a chimney which passes up to the top of the building.

New Motoring Regulations in Denmark.

A new automobile law recently came into force in Denmark. The principal provisions are in regard to (a) the prohibition to drive by night, except along roads entirely illuminated, from half-an-hour before sunset until half-an-hour after sunrise, from August 15th to May 1st, inclusive; (b) the speed limit, which is fixed for Copenhagen and suburbs, the commercial towns and through thickly populated country towns at a maximum of two Danish miles (about fifteen kilometres), and for other places at four Danish miles an hour; and (c) the special application of the law to foreigners with no fixed residence in Denmark. It is enacted that a Bill to revise this law, which is very unpopular with Danish motorists, shall be introduced into the Rigsdag before the end of 1909.

Belgian Motor-car Imports and Exports.

Returns just issued show that the value of the foreign motor-cars and parts imported into Belgium during the nine months ending with September last amounted to only £116,816,

as compared with £135,744 in the corresponding period of last year. On the other hand, there has been an increase in the exports of Belgian motor-cars and parts—from £341,476 in the first nine months of 1907 to £379,100 in the similar period of the current year.

Aeronautical News.

At Toury, near Janville, on the 20th inst., M. Bleriot made a successful flight on his aeroplane, covering seven kilometres in 6 min. 40 sec. at a height of between 12 and 20 metres. On the following day he met with an accident, which, but for his great presence of mind, would have cost him his life. He had requested the committee of the Aero Club to attend, as he intended to endeavour to win the prize offered by the Aero Club for the greatest height reached by an aeroplane. The apparatus rose immediately from its start to a height of sixty feet, but had not flown more than 500 yards when the motor stopped and the machine became stationary and then fell rapidly; the tail hit the earth first and was smashed, but M. Bleriot was fortunately uninjured. —Wilbur Wright performed four flights in his aeroplane on Saturday last, the first alone, being of 3 min. 20 sec. duration; the second with Signor Pirelli, of Milan, as a passenger, lasting 4 min. 3 sec.; the third with Major Petithomme, of the Ministry of Marine, 7 min.; and the fourth with Baron von Lanken-Wakenitz, the German Chargé d'Affaires, 3 min. —In Germany the dirigible airship Parseval ascended on Thursday last week, for the first time since the accident in September. Carrying five persons the balloon, despite the strong wind, manœuvred over West Berlin, and returned within an hour to its landing place. The vessel was out again on the 23rd inst., when, for some reason not fully explained, it descended to earth more rapidly than was intended, and became entangled in a tree, several rents being torn in the balloon before it could be emptied. On the same day the reconstructed airship Zeppelin No. I. made a triumphant first flight, manœuvring for three hours with the greatest success. Prince Henry of Prussia experienced his first aerial voyage on Tuesday, when he had a successful trip, lasting about six hours, on the Zeppelin airship. A number of other passengers were carried.

Miscellaneous Items.

The Automobile Club of Norway has been admitted to the circle of federated national automobile clubs. —A service of electrical motor-cabs is being introduced in the town of Bremen, Germany. —M. Fallieres, the President, has promised to open the Paris Salon on the 28th prox. —The Royal Automobile Club of Barcelona proposes to hold an exhibition of motor-cars in that Spanish town in March next. —The date of the next year's Prince Henry of Prussia touring car competition has been fixed for June 10th to 18th. —According to a recent return, there are now 1,542 motor-cars in use in Wurtemberg, as against 1,014 at this time last year. —An automobile club has just been formed at Lerida, Spain.

A PRACTICAL step towards the adoption of motor vehicles has at last been taken by the Australian Postal Authorities, two Albion motor vans having recently been ordered from the Kellow Motor Company, of Melbourne, for the purpose of clearing suburban letter-boxes and assisting in the general work of the department.

A STATEMENT has appeared in "Le Journal des Tarifs et Traités de Commerce" to the effect that motor-omnibuses holding thirty to forty persons would be very useful for travellers in Algeria. Some of the markets, for instance, are over thirty miles apart. The roads are generally good, and vehicles capable of attaining speeds of from ten to twelve miles an hour would be suitable.

WHAT may safely be claimed to be the largest procession of motor-cars that has so far been organised was recently held in Chicago on the occasion of the Deep Waterways Convention. One of the features of the meetings, which were attended by 5,000 delegates, was a trip on motor-cars lent for the occasion by motorists in Chicago. It is stated that no fewer than 1,000 vehicles took part in the procession, which was close upon six miles long.

THE "G.L." CARBURETTOR.

THERE is probably no adjunct of a petrol engine which has received so much attention during the past few years as the carburettor. Among those who have devoted long and careful attention to the subject of carburation are Messrs. Gillett and Lehman, of Carburation Ltd., Byron House, Fleet Street, London, E.C., who first introduced what they termed a controller and petrol economiser, and later a complete carburettor. A brief illustrated notice of the latter, as exhibited at the Cordingley Show at the Agricultural Hall, Islington, in March last, has already been given in the *M.C.J.* Since that time, however, some detail improvements, tending towards greater efficiency, have been introduced, and, as fuller particulars are now available, the following description of the latest device may be of interest.

The object of the designers has been to produce a carburettor which shall automatically furnish a mixture of the requisite quality or richness at all speeds of the engine, without the use of extra air valves and their concomitant spring and other devices. Speaking generally, the carburettor may be said to be of the constant-level float-feed type, but throughout the construction and arrangement is on unusual lines. Referring to the accompanying illustrations, Fig. 1 depicts the general appearance of the carburettor, Fig. 2 gives a section of the apparatus, while Figs. 3 and 4, for which we are indebted to the "Commercial Motor," show respectively a view of the interior of the carburettor and the combined snail throttle, choke tube and mixing chamber. Dealing first with the constructional features of the carburettor, attention may be drawn to the novel form of the float D (Fig. 2), which reminds one of a diabolo spool; it is built up of two cones screwed together, the top portion, which has all its sides enclosed, being the float proper, the bottom part, of funnel shape, that is having its wide end open, serving to operate the balanced levers that actuate the needle valve C. It is claimed that the design of the float is such as to render it susceptible to the slightest variation in the level of the petrol, while its screw-threaded

Fig. 1.—General View of "G.L." Carburettor.

connection with the lower part enables the level of the spirit in the float chamber A to be adjusted to correspond to any desired point in the spraying jet. The float chamber itself is of a large capacity, so that, if an unusually steep hill is met with, sufficient petrol is present in the carburettor to keep the engine going even if the gravity or pressure feed be insufficient to maintain the supply of liquid fuel, owing to the

acute angle of the gradient up which the car is being driven. The cover of the float chamber is readily removable, it being screw threaded into position in place of being held by the usual screws. A point which will be greatly appreciated is the facility with which the jet K (Fig. 2) can be removed from the carburettor. As will be seen, it has an enlarged base, the outer surface of which fits close up against a ground-in seating, where

it is held by a screw nut and centring screw. Thus, should the jet ever become blocked by any dirt which has managed to pass the filter, it is an exceedingly simple matter to remove and clear it. A groove is formed round the centre of the jet base, in which holes are provided to allow the spirit to flow to the centre of the jet. The only air inlet to the carburettor is that which passes in by the pipe which entirely surrounds the stem of the jet.

Another important feature of the device is what is known as the pressure controller and petrol economiser; this was one of Messrs. Gillett and Lehman's first introductions, and is incorporated in the new carburettor, the object of the arrangement being the regulation of the flow of spirit, as well as of the flow of air past the jet, by the degree of vacuum which is caused by the suction of the engine. It will be seen from Fig. 2 that a connection is made between the admission pipe above the throttle, on the one hand, and on the other with the top of the float chamber and the jet chamber by a small pipe H. In Fig. 1 the outlet of the latter in the jet chamber is shown as being just below the top of the jet, but in the new models it is, as seen in Fig. 3, just above it, being practically always kept open by means of a slot formed in the rear wall of the snail throttle. The pressures on either side of the throttle are, of course, fluctuating with every movement of the latter, but by the aid of the controller a mean between the two points is established, so enabling the pressure of air in the float chamber to automatically change in such a way that the flow of the petrol through the jet is varied in proportion to the degree of throttle opening and the speed of and load on the engine.

Without a series of drawings it is very difficult to clearly illustrate the construction of the combination throttle, choke tube, and mixing chamber. Some idea of its shape will be gathered from Figs. 3 and 4, which show it in position on the left, and detached at the right. The lower edge of the chamber J, into which the top of the jet projects, is provided with a long slot of approximately V shape, which forms the choke tube, a narrower portion of the slot being brought around the jet as the

B

throttle, formed by the tapering space at the top, is closed. The supply of air is thus diminished as the throttle is shut, the richness of the mixture being consequently increased. A further point about the carburettor is the means provided of entirely closing the throttle and introducing fresh air into the cylinders when running down hill, so scavenging the same and also enabling the engine to be used to some extent as a brake. The snail throttle is provided at R (Fig. 4) with a slot which does not extend right across. In the wall of the throttle chamber a V slot is also formed, this being entirely closed while the throttle is the least open. When, however, the throttle is fully closed a slight movement of the lever brings the two slots into line with each other and also in communication with the admission pipe, so that the engine can only draw in pure air. In this way the motor is kept in a cool condition and waste of petrol is prevented.

A simple yet effective method of operating the throttle is adopted. As will be seen from Fig. 2, the spindle on which it is mounted has fixed on it, outside of the body of the carburettor, a pinion R, operated by a steel rack S, the latter being connected with the usual throttle lever on the steering column. The necessary richness for starting is attained in a simple manner, the air slot in the snail throttle being constructed in such a form that, at one point of movement of the lever, the throttle proper be-

Figs. 3 and 4.—Details of "G.L." Carburettor.

comes wide open, and at the same time the air opening is almost entirely closed. Turning the starting handle under this condition induces a good flow of petrol from the jet, accompanied by very little air, which both occur at the same time, so that the engine has no chance of refusing to start. Having placed the throttle lever at starting point, the handle is turned once or twice, and, where fitted with magneto ignition, the engine starts immediately, or, in the case of a car using coil and accumulators, the motor starts on the switch. The vaporisation of the fuel is accomplished perfectly; instead of attempting to spray the petrol as usual, a flat, curved surface is presented to the jet, the distance becoming greater or less in accordance with the throttle-opening. On reaching this surface the petrol spreads out into a thin film, which is swept upwards towards the engine by the incoming air, the latter, owing to the tapering form of the air passage, increasing in velocity as maximum point of throttling is reached. In driving, the air-admittance port opens and closes in fixed proportion to the degree of throttle-opening, the relation between the air inlet and the gas outlet being such that correct mixture is obtained even at extremely low speeds, while, with the throttle remaining in the same position, the tendency to take more petrol as the speed of the engine picks up is counteracted by the controller already referred to.

In company with the inventors we recently went for a short trial run on a 12-14-h.p. Argyll car fitted with one of the new

carburettors, when its ready responsiveness to sudden changes of throttle opening, engine load, and road gradient were fully demonstrated. Making for the somewhat hilly district of Hampstead, the capacity of the device in furnishing a properly proportioned mixture at low as well as high engine speeds was clearly shown in the way the car could be slowed down in traffic on a hill and the speed picked up again as the throttle was opened, and furthermore its ability to hold the top gear, it doing this, without any slipping of the clutch, until the travelling speed had fallen to such an extent that in many cars the time for a drop to a lower gear would have been indicated by a "knocking" engine. One of the most convincing proofs of the instantaneous action of the controller in regulating the flow of spirit through the jet, and so varying the quality of the mixture, was seen in the way a practically uniform speed of the engine was maintained whether running light or under load. In most cars, when the clutch is disengaged the motor will commence to "race," unless the throttle is quickly closed; in the case of the Argyll fitted with the "G.L." carburettor no such tendency was observable; when the load was taken off the engine by depressing the clutch pedal, but without touching the throttle or ignition levers, only the slightest perceptible increase in engine speed was noticeable, while conversely, when the clutch was let in, even on a gradient, no pulling up of the motor could be felt. As for the advantages of the carburettor in the way of economy in fuel consumption we were not able to check this ourselves, but we are informed that the car on which we rode, and which is about two years old, can do from twenty-five to twenty-eight miles to the gallon, while in the case of a 16-20-h.p. vehicle of another make the consumption has been improved from fifteen to twenty-six miles to the gallon.

THE CENSUS OF PRODUCTION.

IN connection with the Census of Production which is being taken by the Board of Trade under an Act of Parliament passed two years ago, information is now being obtained from firms in connection with the motor and allied industries which will, when brought together, give us some idea as to the actual extent of the automobile industry in this country. The information to be obtained in connection with this Census will, of course, be regarded as strictly confidential, and care is being taken that it shall only be used in the compilation of general statistical results. The questions upon which information is required are the number and net selling value of motor vehicles, motor chassis and motor-cycles. Lamps for motor-cars are in a separate category to "other parts and accessories," the net selling value of which is required. A column is also set out for the value of repair work done, and also of the construction and repair work executed by the firm's workpeople on its own buildings and machinery. Information is also required with regard to the aggregate cost of materials purchased and the stores used in the year for which the returns are required. Under this heading materials will include components, parts and accessories, worked up or used in producing the output, fuel, gas and electric current purchased, oil, waste and other stores, all tools replacing these worn out in the year, materials for packing and non-returnable cases. The Board of Trade is also desirous of obtaining information as to the approximate number of people at work on the last Wednesday in January, April, July and October, wages earners and salaried persons being regarded in separate categories. The number of calendar days on which the establishment was open for production is also required, and questions are set forth with a view of obtaining the record of the engine equipment of motor works so far as the capacity of engines and the amount of electricity used is concerned. The way in which Mr. A. Wilson Fox, who is Comptroller-General of the Census of Production, has dealt with the motor trade should do much to favourably impress its members with the advisability of giving all information that is available, so that we may ultimately have a complete view of the actual industry. The particulars with regard to motor-car bodies, &c., will be included in the carriage, cart and wagon building trades Census.

AN AMERICAN MOTORIST IN ENGLAND.

DURING the past summer more American motorists have been met with in English hotels than ever before, and the facilities now provided for shipping cars from the United States to Continental and British ports, where they can be readily obtained for road service, has done much to popularise motor travelling among Americans abroad.

Now that the season is nearly over the views of some of those who have "done Europe" are being communicated to the Press, and among the most interesting reminiscences which have come to our notice are those of Dr. A. H. Heaton, who, leaving New York early in the summer, made a 7,000 mile tour through Europe. He commenced from Paris, where the examination for a motor driver naturally interested him, and the doctor was much struck, on coming to London, to find the ease with which the licence to drive in Great Britain could be obtained. Speaking generally, he, in common with other Americans who have motored here, was gratified with the progress of the motor movement, as well as with the novelty of such a means of taking a holiday.

We have before us the record* of a journey through some picturesque parts of southern England, with historical and literary observations by the way. This is published by Messrs. G. P. Putnam's Sons, the author being Mr. John M. Dillon, who has previously been associated in the literary world with such dry-as-dust compilations as "Marshall's Constitutional Decisions." Dropping legal phraseology and subsiding into the chatty form which one would expect when writing to a friend, Mr. Dillon has made a book of 300 pages which will be read with interest on this side of the Atlantic and with profit on the other. Regarded generally, Mr. Dillon and the party with him, who travelled in an American car brought from New York and also a Daimler hired in London, were favourably impressed with the British hotel hospitality. One or two contrary instances are frankly and fearlessly given by the author; as, for instance, in the account of one "attractive" hostelry in the Midlands:—

It stands in ample and well-kept grounds, and everything is clean, neat and prosperous. The beds are good, the linen soft and fine, the attendance perfect, there is only one trouble, they do not give their guests any food. The buxom landlady can certainly make an infinitesimal quantity of food good further than any living person. My roast beef was impossible. It was like trying to eat one of the motor tyres.

But, apart from all this, Mr. Dillon discovered many good hotels, notably the Randolph at Oxford and the Empire at Bath. The result of these several weeks' touring in this country has led him to give the following practical advice to those of his countrymen who are fortunate enough to have similar opportunities for motor holidays in this country:—

Having decided upon the hotel, it is without doubt advisable to telegraph in advance for rooms, and if the weather is at all chilly or damp it is well to ask that they be warmed. Sometimes you may get a room fairly comfortable if means exist for heating them. The heating apparatus in the ordinary English inn or hotel is usually a thing to laugh at if you are not too cold and too out of humour.

The way of the travellers was from London to Hampton Court and along the Thames side from Maidenhead to Henley, thence to Reading and Oxford, where a practical member of the party, having counted up the mishaps and the repairs which had been necessary owing to a couple of breakdowns, totted up the expense as the party was on the train for Oxford, leaving the vehicles in the hands of the repairer. He found "how economical one can travel by motor and find that, including repairs, transportation, chauffeur's salary, &c., you have been motoring at a cost of 14 dols. per mile." "I retorted that we were on the train then and had given up motoring temporarily, consequently we were saving money every minute, therefore everyone ought to be happier than his appearance indicated." It was not the English car that caused the trouble. At Oxford the party seemed to have dipped into the archives of every college, the result being that

about 100 pages of the volume are concerned with doings in the ancient university city.

Blenheim was included in the journey, but "on arriving there we found that motor-cars were not admitted in the estate, as the Duke disliked the odour." From thence the route taken was to Bath, and in that delightful district an opportunity was found for reflections upon the difference between the English and American scenery. In this chapter literary references scintillate like stars in a clear sky and afford a good example of the author's characteristic style, for we have mention of Scott's Kenilworth, the description of the district given in Tom Brown's Schooldays, a quotation from Russell Lowell, a criticism of Reynolds' pictures, reminiscences of Beau Nash, tales from Goldsmith's entertaining stories of the literary men of the period, eulogies of Bath by Carlisle, Macaulay, and Walter Savage Landor, to say nothing of the incident of Fanny Burney and Mrs. Thrale taking lodgings in the town. Not many men manage to revive such memories of the past as did Mr. Dillon in the course of a modern holiday. His views of English landscape are interesting, revealing a close observation and keen insight into the differences existing between this country and his own.

The hills seldom rise above ten or twelve hundred feet, and will hardly average a half of that, but they are adorned in their own manner both by nature and man. The little villages are clustered in the combs or on the summits of these hills or again on their sides, the little church with its spire lifted above the surrounding trees and the cottages are nestled about it. Topographically America far exceeds England. Nature with us is in a more sublime mood, but let us confess cheerfully that as regards the ornamentation of the landscape America suffers greatly by comparison. The farms, villages, and roads are component parts of the whole, and lend beauty and pleasing effects to the general landscape. With the exception of purely manufacturing towns one seldom, if ever, sees a collection of buildings, whether large or small, which does not by the charm of its setting enhance the view and add a new interest and a pleasing variety to the scene, and again let us gracefully admit inferiority in the matter of picturesque farms and farm buildings.

Away to the West went the party, and were puzzled by the Somerset dialect, the untruthful ladies of Taunton and the giving out of petrol at Crowcombe. Fortunately, however, they managed to borrow some from a passing car, thanks to the motor freemasonry which, although not so common as was the case in the early years of motoring, has not yet entirely gone out of fashion among those who travel on the road. Continuing the trip to Lynton and Lynmouth, they were persuaded from attempting the Porlock Hill by motor, owing to the terrible accounts given of previous motorists who had thus ventured by the landlord of their hotel. The return was through Winchester and then via Brighton to London, the stay at the seaside giving opportunity for many quaint reflections on the ways of holiday-makers as well as the confession that the English roads are perfection. This probably was due to the author's knowledge of the main thoroughfares of the United States, compared to which doubtless our English highways must appear excellent indeed. In an interesting addendum Mr. Dillon gives some practical suggestions to those who travel by car, and urges the motorist on a long tour to provide himself with the following articles and parts:—Some extra sparking-plugs, an extra pair of driving chains and a few extra links, two extra exhaust valves, two extra exhaust springs, two extra inlet valves, two extra inlet springs, non-skid gaiters for the rear wheels, one extra fan belt, four extra pump blades, one extra tyre pump, an assortment of bolts and nuts, a tyre repair kit, a tube of powdered fire extinguisher, a voltmeter, a short piece of small but tough rope, a number of inner tubes and a Stepney spare wheel.

"Motor Days" have certainly provided us with some interesting reading, and those who have spent the summer in travelling their native land will be glad to turn to Mr. Dillon's entertaining volume and tell their journey o'er again during the winter evenings that are coming upon us. The illustrations comprise some excellent pencil drawings by the author, together with several photographs which are more or less familiar to English readers, but which will be quite new to those Americans to whom Messrs. G. P. Putnam's Sons have issued the book simultaneously with ourselves.

* "Motor Days in England." By John M. Dillon. London and New York: G. P. Putnam's Sons.

MALVERN AND MOTORS.

"MALVERN" is something more than a town of pleasant aspect and notable healthiness. It comprises the eastern slopes of a fine series of hills for a distance of nearly six miles, with the exception of West Malvern, which lies on the western side. The other places are Great Malvern, Malvern Link, Malvern Wells, North Malvern and Little Malvern—all linked in one authority which delights in describing the district as Malvern. To visitors Malvern, to quote the late Sir Henry Campbell-Bannerman, "recommends itself with its free air and lovely country," as well as the variety which the range of hills give to the landscape. Fortunately the roads of the district are good and lead to some very charming towns, for many excursions by car may be conveniently made to the following places—to name some that occur as the memory of a holiday in the region—Worcester, Bromyard, Abergavenny, Bridgnorth, Cheltenham, Droitwich, Chepstow, Church Stretton, Deerhurst Priory, Evesham, Cirencester, Forest of Dean, Kenilworth Castle, Goodrich Castle, Gloucester, Hereford, Hay, Ledbury, Ross, Leominster,

SOME USEFUL NOTES.

WHEN leaving the car at night, or for any length of time, make it a practice to shut off the petrol supply. If this is not done, and if there is a leak, or a flooded carburettor, a fire may be caused by someone carelessly tossing a burning match under the car.

THE proper unguent for the cupped leather washer of the piston of a tyre pump is vaseline. Oil is too thin and it tends to work into the rubber hose, and even into the tyre itself if too much is used. Vaseline, on the other hand, clings to the leather and lasts a considerable time.

THE universal joints of cardan shafts do not, in many cases, receive the amount of attention due to them at the hands of those responsible for the running of the car. The joints get a far greater amount of work to do than they are generally credited with, and, owing to their generally inaccessible position, they receive but little attention. The chief point is to keep the

The Jubilee Drive at Malvern.

Warwick, Ludlow, Monmouth, Pershore, Leamington, Raglan Castle, Stratford-on-Avon, Tewkesbury, and Tintern Abbey.

There has lately been some amusement in the place, owing to the suggestion introduced to the Town Council by the local energetic Improvement Association. It was suggested that the main roads in the district should be indicated by pieces of coloured glass, of various shapes, affixed to the street lamps, and that notice-boards should be erected at the approaches to the town and in the centre of Malvern, explaining these signs. Despite the support of the Gas Company the proposal was laughed out of the Council Chamber, one speaker declaring the suggested indicators would be an absolute puzzle to motorists. The town would be illuminated like a Chinese tea-garden with these pieces of blue, red, green, and yellow glass. Motorists would be obliged to descend from their cars to read the explanation of these mystic lights which it was proposed to print on notice-boards. The scheme has been rejected.

Apart from the pleasures of the visiting motorist, the visitor to Malvern is catered for by the Portland Motor Garage, which not only organises daily motor trips but also possesses a riding school—a combination that indicates the enterprise associated with this lovely district of our country.

joints well lubricated and free from grit and dirt, which is so disastrous to their long life and sweet working. If not already so provided, a simple way of accomplishing both objects is to encase the joints in a flexible covering filled with grease.

MESSRS. GROUVELLE AND ARQUEMBOURG, the well-known makers of ribbed-tube radiators, report that in reality it is very rare that any incrustation forms in the pipes of radiators, as incrustation only takes place when the water is at boiling point, which ought not to take place in a radiator. When it does, it is an indication that the apparatus is not large enough. The same remark does not, however, apply to the water jackets of the motor, where the water often reaches a very high temperature. In cases where incrustation does happen to form in radiators, a small quantity of hydrochloric acid should be added to the water, and this caused to circulate for a time, making sure afterwards to thoroughly remove all traces of the acidulated water. Messrs. Grouvelle and Arquembourg point out that while incrustations are rare, deposits are frequently formed on the internal walls of the pipes, due to impurities in the water. These can, however, be removed by sudden injections of water by means of a pump.

THE SOCIAL WHIRL.

THE King motored from London to Newmarket early on Tuesday, being received on arrival by the stewards of the Jockey Club. There are several house parties in the district, among the motorists at Newmarket being Lord Wolverton, Lord Howard de Walden, Sir Ernest Cassel, Mr. Leopold de Rothschild, and Mr. Arthur Sassoon. The Earl of Ellesmere is, as usual, at Stetchworth Park. On Tuesday he motored over to the course in time for the first race.

LAST week-end Prince Arthur of Connaught and Mr. A. J. Balfour visited West Dean Park, where the King was staying, motoring to and from Chichester.

THE Duke of Northumberland's remarkable tirade against motorists and their cars at the London Guildhall on Tuesday was received with cheers by an audience obviously partisan. Lord Willoughby de Broke and Lord Waldegrave were on the platform, and I noticed four M.P.'s present—Messrs. Harold Cox, who had been called "the champion of all lost causes" in the House of Commons on the previous evening, Arnold Herbert, F. Mac-karness, and the persistent Cathcart Wason.

LORD AND LADY GUTHRIE recently entertained the nurses of the Edinburgh Hospital at Swanston Cottage—five miles from the city. This delightful house was once the summer home of R. L. Stevenson, from 1867 to 1880, and the nurses, conveyed in thirteen motor-cars without a suspicion of a superstitious feeling, were delighted at the opportunity of seeing such a literary Mecca, as well as of meeting Lord and Lady Guthrie.

MANY novelists are motorists. Mr. Rudyard Kipling was one of the early drivers, and as long ago as 1901 I met him on a car travelling from his residence at Rottingdean to Brighton. Sir A. Conan Doyle and Mr. Max Pemberton, too, can deal with motoring matters as interestingly as they can produce fiction, and Mr. and Mrs. C. N. Williamson are, of course, equally at home on the car as in the library. It is not so generally known, however, that Mr. Robert Hichens, the author of the "Garden of Allah" and other delightful works, who has been staying in a Kentish village lately, is also a motorist. He lives in a charming place in Worcestershire, and has driven all over the country without coming into conflict with the police. He employs a chauffeur who is a Sicilian and a very careful driver.

IN further illustration of the money-distributing powers of the motor-car I would refer to the nine motorists who were fined an aggregate of £38 and costs at Dumbarton on Monday. One was the Earl of Shrewsbury; others came from West Hartlepool, Pollokshields, Stirling and Helensburgh, and the other four from London.

CAPTAIN QUINTIN DICK, who has been touring in Scotland recently in a car from the Shrewsbury Motor Garage, has been elected a member of the Royal Automobile Club. Captain Dick was for some time tenant of Walcot, the beautiful Shropshire seat of the Earl of Powis.

THE Duke of Grafton has within the last few days been practically all over the country. He went close to Hereford, and never saw anything so perfect as the notices and warnings and the directions of roads as in Gloucestershire, Warwickshire, and Worcestershire. Hence he has come to the conclusion it is a disgrace to Northampton that things are so bad in this respect. There are no notices at all to catch anyone's eye in that county, except what his Grace describes as a little sort of triangle in a dark spot no one can see.

LORD ALVERSTONE, the Lord Chief Justice, is a good sportsman as well as a sound lawyer. Motoring can be added to his accomplishments, and his lordship follows technical controversies with the zest with which he pursues the records of sport. That was evident in a case heard in the King's Bench Court the other day.

LOLLIUS.

HERE AND THERE.

MESSRS. FRISWELL, LTD., inform us that they have supplied a Standard six-cylinder limousine to La Milo.

MESSRS. HANS RENOLD, LTD., secured a gold medal for their exhibit in the machinery section of the Franco-British Exhibition.

A COPY of a new monthly publication, "The Australian Motorist," claimed to be the first motor paper in the Colonies, has just reached us.

THE fiat has gone forth that racing cars are not to be exhibited at Olympia, in accordance, it is generally conceded, with a suggestion emanating from the region of Piccadilly.

THE magistrates of the Brentwood Petty Sessions have addressed a long letter to the Chief Constable of Essex with regard to prosecutions for speedy driving by motorists in that county.

THE 1,000 miles trial of the 25-h.p. "Valveless" car entered by Messrs. "Valveless," Limited, was completed on Saturday; the Technical Committee met on Monday, and the certificate was passed. Messrs. "Valveless," Limited, have applied for another trial of 1,000 miles. This will commence on Monday next.

Mr. T. H. Woollen, the late General Manager of Messrs. Clement-Talbot, Ltd., at the wheel of his 15-h.p. Talbot.

This car, the engine of which comprises four cylinders 90 mm. by 117 mm. stroke, has a unique record, for it has taken part in five competitions during the season just ended, and has obtained the highest award on each occasion. Altogether nine prizes have been won by Mr. Woollen on this car, comprising five handsome silver cups and four gold medals.

ANSWERING Mr. A. B. Markham, M.P., in the House of Commons the other day, Mr. John Burns said that if it were true that the regulations with regard to motor traffic were habitually broken in every street in London—as alleged by his questioner—the responsibility rested with the L.C.C., which would be doing its duty by making representations on the matter.

A COPY of the "Dictionary Autotechnic," compiled in four languages by Herr R. Schmidt, and which forms Vol. 23 of Kuster's Autotechnical Library, has reached us. The work is published by Messrs. Richard Carl Schmidt and Company, of Berlin, and Mr. David Nutt, London, and is intended for the use of British touring motorists, the English words being given in alphabetical order and the corresponding word or phrase in German, French or Italian in parallel columns. While the author has undoubtedly been at great pains to make his compilation complete, we fear that the book will need considerable revision ere it can be thoroughly recommended, for in the few pages we have glanced at we have found several errors which, though small in themselves, detract from the value of the dictionary. Thus we find "adjusting devise," "anti-freezing solution," "ash word." Some of the technical phrases, too, are not quite clear to us. For example, we are puzzled as to the meaning of "air lever throttle" and "petrol spring," to mention only two examples.

MR. JACOB HUTCHINSON, of Cleator Moor, has bought a Halley motor-van for the purpose of conveying mails between Cleator Moor and Sellafield, a distance of twelve miles.

RECENT purchasers of Daimler cars include Sir Charles Metcalf, Bart., the Hon. Keith Turnour-Featherstonehaugh, the Marchioness of Donegal, and the Governor-General of Costa Rica de la Guardia.

THE British Motobloc Syndicate, Ltd., have now on view at their depot at 85, Shaftesbury Avenue, W.C., the first of the new 9-h.p. single-cylinder Motobloc cars reference to which was made in our last issue. The vehicle is of the live axle type, has three forward speeds, and throughout is on up-to-date lines.

FACED with the problem of taking the whole of the members of the City Council of Lincoln, with the officials, to Elkesley, near Retford, for the purpose of the ceremony of the turning of the first sod for the new water scheme, the engineer arranged a fleet of sixteen cars, and on Saturday the large party were taken to Elkesley, then through the beautiful Dukeries estates to Ollerton for the official lunch, and back to Lincoln, nearly sixty miles, and without a single hitch to any car.

AN effective and very simple device for separating solid particles and water from petrol as it enters the carburettor is the tee connection shown in the accompanying sketches, which are taken from the "Motor Age." The petrol pipe is probably $\frac{1}{2}$ in. pipe size and the union to the carburettor the same size. Both the pipe and the union can be threaded into the tee and a short $\frac{1}{2}$ in. pipe one or two inches long is threaded into the

bottom connection of the tee and is closed by a removable cap or petcock. The flow of petrol through the tee will be slow enough to permit water and solid particles to settle in the bottom pipe. Evidently the tee can be connected with ease, and without change in the length of the petrol pipe, whether the carburettor connection is in the side or bottom. The threaded connections should be sweated together so that vibration will not start leaks, this being a prolific source of trouble with poor joints.

AN interesting demonstration was given on Thursday at the Wolseley-Siddeley Garage, York Street, Westminster, of the qualities of a new discovery in motor spirit. The new spirit, which is known as N.U., is claimed to eliminate all the fumes from combustion and over-lubrication, thereby dispelling any noxious discharges from the exhaust which are so unpleasant and injurious.

AT a conference of the Street Noise Abatement Committee, held in London, on Saturday, the following resolution was proposed by Judge Wheeler, K.C., seconded by Mr. J. H. Seaverns, M.P., and adopted:—"That in view of the nuisance to property owners and residents in the metropolis, and the danger to those who use the streets caused by the noisy and offensive traffic now permitted, a special committee be appointed, with power to add to their number, to ascertain the present condition of the law upon the subject and the best mode in which it can be enforced, and, failing adequate protection to property owners and to the population at large, to advise in what form legislation is desirable."

RIGAL, Hautvast, Duray, Nazzaro and Wagner left Havre on Saturday last for the United States in readiness for the A.C.A. Grand Prix race in Savannah, which is to be held on the 26th prox.

OUT of 148 cars which passed one point in the west end of London in half an hour one afternoon recently it was noticed that fifteen only did not contain ladies, and of the remaining 133 cars the passengers consisted of 160 women against thirty men.

THE New Zealand Customs authorities have lately given a decision to the effect that motor-car chains are to be classified under No. 447 of the tariff, the duty on foreign-made chains being 10 per cent. *ad valorem*, while those of British manufacture are admitted free.

WITHIN the covers of "Picturesque Staffordshire," a new guide to the North Staffordshire Railway Company, are several maps, which, being photographic reproductions of the latest Ordnance Survey maps, add to the value of the little volume, which is published by Messrs. Wood, Mitchell and Company, Ltd., of Hanley.

ON Friday last week Messrs. C. E. Whittaker, Ltd., submitted one of their Imperia 20-30-h.p. cars to a speed test on Brooklands track. Except that it was fitted with a two-seated body and was geared as high as possible, the vehicle was of the standard type, the engine comprising four cylinders 106 mm. bore by 130 mm. stroke; according to the certificate issued a speed equal to no less than 75.464 miles per hour was attained.

MR. J. E. HUTTON informs us that after very careful consideration of the position of the motor trade he has determined to relinquish trading on his own account, and has consequently decided not to take over the contract for the "Hutton" car, with which he will no longer be identified. Mr. Siddeley having made him an offer to take up an important position in the Wolseley Motor Company, Mr. Hutton has accepted it and will join them on the 2nd prox.

THE Motor Supply Company, Ltd., of Piccadilly, W., have delivered this week a Renault 14-20-h.p. car to Mr. Mortimer Mompes, the famous war artist; also a Standard 20-h.p. six-cylinder with two-seated Victoria body to Lord Howard de Walden; a Siddeley 14-18-h.p. to Mr. E. P. Powles; a Standard 30-h.p. landaulet to the Hon. Louis Greville; a Delaunay-Belleville 15-h.p. six-cylinder to Mrs. Sauber; and a Daimler 42-h.p. landaulet to Mrs. Stanton, of York.

FROM Messrs. Dennis Bros., Ltd., we have received a photograph of the 30-cwt. van recently sold to Messrs. William Whiteley, Ltd. We understand that the machine has been running with considerable success, and is giving the greatest satisfaction. The engine is a 20-h.p. four-cylinder, fitted with both magneto and accumulator ignition with turnover switch. The change-speed gear gives four forward speeds, having a direct drive on the third speed and a geared up fourth to reduce petrol consumption.

AT the forthcoming show at Olympia Turner's Motor Manufacturing Company, Ltd., Wolverhampton, will exhibit a number of entirely new models of the Turner-Miesse steam cars, including light vehicles fitted with cardan axle, one model specially designed as a two-seated body, and one a light 10-h.p. touring car fitted with a four-seated side-entrance body. This latter will be the leading type for the 1909 season, and as it will be offered at a moderate price it should meet the requirements of many steam car enthusiasts. The makers inform us that they have perfected a paraffin burner (designed especially for the work of a medical man) which cannot blow out or backfire, no matter how long it is kept standing, and which can be turned up and down quite readily, doing away with the use of a pilot light except for lighting up from dead cold. No petrol is required with this burner even during the operation of lighting up. The company advise us that they have appointed Messrs. Taylor and Smart, of the Westminster Motor Works, 45, Horseferry Road, S.W., their sole agents for London and district. A full range of the new models of the Turner-Miesse steam cars will be on view at the London depot immediately after the Olympia Show.

Correspondence.

[Letters to the Editor should be addressed to the office, 27-33, Charing Cross Road, London, W.C.]

THE DEVELOPMENT OF MOTOR-CAR DESIGN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was with much interest that I studied the account of the new Napier 15-h.p. car, and was especially struck by the many new features, new to Napier practice and therefore new to the ordinary accepted principles of the majority of present-day cars. The main new features are, I think, as follows: First and foremost, worm drive, undoubtedly, if properly designed, the very best drive yet invented. The lubricating system is also very sound. I would draw attention also to the method of attaching the magneto so as to be released by one bolt. Another very important departure is placing the fly-wheel in front of the engine, surely the right place, if the proper balancing of the crank-shaft in its bearings is to be secured. Multiple disc clutch is also fitted, the sweetest clutch again, if properly designed, on the market. The bolting of the gear-box (clutch, brake and gears) to the crank chamber is also sound practice, as, among others, it has the great advantage of enabling the engine and gears to be dropped from the car all in one in a very short time. I note also that castellations are used for attaching the brake-drum to the driving shaft, a very beautiful form of joint. Now all, or nearly all, these excellent features are new to Napier practice, yet all have been thoroughly tested and have stood the test of several years' experience, being embodied in the Lanchester car ever since the new vertical engine was first put on the market in their 20-h.p. cars. Surely a vindication, if vindication were now needed, of the principles adopted and so courageously adhered to by the Lanchesters. They have been undoubtedly the pioneers of much that has been recognised to-day as the soundest and most scientific principles in motor-car design. Every one of the features as enumerated above are now to be found in the latest 28-h.p. cars, and are found and were found in the 20-h.p. cars three years ago.

I address to you this letter as I think every motorist should be conversant with the history of the development of the motor-car, and because I think honour should be given (though sometimes tardily) where honour is due. As the proud possessor of one of the Lanchester Company's 20-h.p. cars I am particularly gratified in that, having always, since way back when I drove a 10-h.p. air-cooled Lanchester, been a thorough believer in their principles, I now see them adopted by some of the leading motor engineers in England.—Yours truly,

ARTHUR N. PAZOLT.

THE HORSE-POWER RATING PROBLEM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The report of the S.M.M.T. Rating Sub-Committee on horse-power formulae for petrol engines has recently been published, and motor papers have devoted space to criticism, or to a "criticism of the criticism" of said report. Opinions may be at variance as to the usefulness and reliability of the results arrived at, but all are agreed on the S.M.M.T. deserving our warmest thanks for the conscientious work done by its sub-committee. I cannot help thinking, however, that in this case the "saint is not worth the candle," for, in my mind at least, quite a number of unsolved problems in motor-car construction have greater claims to the efforts of the gifted technical members of the society than the comparatively irrelevant question of a suitable rating formula. It occurs to me that, even granted the right formula were found, we would have no practical use for it, being almost in the same plight as the shipwrecked person stranded with a bag full of gold on a bare and lifeless island.

With the exception of commercial vehicles, automobiles can be divided into two classes, (1) touring cars, (2) racing cars; and dealing first with the touring cars, however simple and reliable the formula might be, it is evidently preferable to have the engine—or, which is better still—the complete transmission on the chassis, directly tested by means of one of the well-known testing plants. When somebody is ready to pay £500 and more for a car, he is undoubtedly entitled to see the behaviour of both engine and chassis when a brake test is applied to them; and the result of such a test is certainly more reliable than the one obtained by the application of a more or less empiric formula.

I should even go a little further and say that, in actual touring car practice, the knowledge of the engine h.p. is useless, and under circumstances might even become misleading. A prospective purchaser is entitled to have a free trial on the same or similar car to the one he wants to buy; this will afford him an opportunity to judge of the power, quietness, comfort, fuel consumption, speed and hill-climbing properties of the car in question; and if the results fit the requirements of the buyer, why or what would he care about the actual h.p. of the engine? The use of a h.p. formula—no matter which—as a criterion for classing competing touring cars is also objectionable, since for such vehicles all-round reliability, economy, price and smoothness of running are far more important factors than speed alone. A touring car contest is supposed to give the public information about the behaviour of a car when in the hands of the purchasers. The trial should therefore take place on such roads as most usually met with by touring cars. Under these circumstances it is at once clear that the only criterion by which to classify

competing cars is the fuel consumption; this latter, of course, varying according to the weight of the vehicle. The winner of its class should then be the car that shows the best compromise between reliability, comfort, smoothness of running, price and greater economy. Such are the factors by which to judge of a touring car, but I utterly fail to see where the h.p. of the engine comes in. Among engines of the same type and same power the best—both mechanically and commercially—is invariably the one showing the least consumption of fuel; this last criterion, therefore, is not only sufficient for classification purposes, but is actually conducive to good design and faultless workmanship to a greater extent than the use of a h.p. formula, whether it takes into account the stroke or not. How many miles he can get out of his car per gallon of petrol, the speed, both on the level and uphill, and reliable information about the comfort of the vehicle are the points insisted upon by the average motorist. He does not care a jot, neither would it be of any help to him to know, whether his engine is a 10 or a 100 h.p.

With racing cars speed alone is the decisive factor. We have had every opportunity to give a fair trial to various formulae, but in each case the practical results have been almost *nil*. Nor could we have expected anything else, since, whatever formula be employed, it is inherently incorrect, and as such nearly always provides a loophole for the enterprising manufacturer to get actually more power out of his engine than shown by the formula. We have witnessed races in which the piston displacement was the basis for classing competing cars. The result has not been the long-dreamed-of engine, with the ideal relationship of bore to stroke, but a fast short stroke engine, quite useless for practical purposes. On the other hand, whenever the bore alone is considered, the maker is at liberty to choose the speed and stroke; prepossessed by the idea of winning the race, he will not strive after the best compromise between speed and stroke, but he will simply increase them both

From a Sketch

[in *La Locomotion Automobile*.

until he thinks the engine thus evolved is more powerful than those of other competitors. The result is thus such as could have been easily foreseen—that is to say, a fast long stroke motor, which, we are told, is also quite unsuitable for propelling pleasure cars.

The rating formula recommended by the report already referred to contains a constant whose value varies according to the type of the competing cars; or, in other words, instead of building the engine on the basis of the formula, we stretch this latter to suit the engine, whether this be a freak one or not. This, again, clearly shows that not only does the h.p. worked out by a formula convey no definite idea as to what the car is actually going to do, but this same h.p. is also an illogical criterion for classing competing cars. It is also incidentally a proof of our ignorance of what is going on in the cylinder, and of the most suitable value of the different cylinder dimensions; and if so, what is the good of concealing this lack of knowledge under an elastic formula? Take the case of steam practice, for instance; does not the same h.p. formula hold good whether it is applied to an engine driving a dynamo or to one driving a cotton mill or a forge blower? Yet no one cares a jot about knowing the h.p. of a locomotive or even of a tractor or a steam roller. Besides, I am referring now to speed contests only. Does it not sound somewhat illogical to get the cream of our technical men to work out for us an elaborate formula, so as to eliminate freak engines, when the contest which is to show up the performance of a car is nothing else but a freak feat throughout? How many times is the race won by the driver though lost by the car? Where is the motorist who, inwardly at least, had not some reluctance in crediting the winning vehicle with being the best among the lot. Are we not used to see people quite enthusiastic about a race, and yet belittle its results the day after, if their favourite vehicles did not succeed in securing a place. Where is the engineer who can retrace to such contests a single useful departure in practical engine design. What valuable information about the motor have we secured, that would not have been gained by a reliable bench test?

Whenever the work to be done is not constant, as in the case of petrol cars and locomotives, the h.p. will also vary, and the knowledge of its actual value is therefore useless. But to each mile travelled a certain amount of petrol must be used, and, other conditions remaining the same, that engine is best, both mechanically and economically,

that covers the distance with the least amount of fuel. Incidentally it will be observed that a certain h.p. will correspond to the amount of petrol actually used; but, while we can exactly control this latter, we are in the dark as to the former.

Why, then, not introduce the fuel consumption as a criterion for classing purposes instead of using h.p. formulæ, which are inherently incorrect and otherwise unsuitable? If, instead of hunting for a never-attainable h.p. formula, we introduce the fuel consumption—or even, as an alternative, the diameter of the inlet valve—we leave the maker completely free to adopt what dimensions he thinks best, thus fostering a sound and economical engine—the only one really required—we will acquire valuable data on the relationship between petrol consumption and speed, beside insuring greater attention being paid to carburettors and all-round efficiency.

It has been suggested to me that one object of the new rating formula was to arrive at a more correct catalogue rating. I daresay that every self-respecting maker either has a motor testing block or can easily fix one up for a few shillings. Why, then, not give in the list the actual b.h.p. instead of the incorrect h.p. as worked out by the formula, or the nonsensical nominal h.p. sometimes referred to?—Yours truly,

C. A.

[The above letter opens up quite an interesting subject, on which we shall be glad to have the views of readers.—Ed. M.C.J.]

THE TRANSPORT OF CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of the 24th inst. a descriptive article referring to the North Eastern Railway Co.'s facilities for shipping

Down had to come the radiator, off had to be taken the starting handle, the pump had to be removed, a dozen nuts which held the plate over the distribution gear had to be undone, and then a loose, idle distribution pinion was found; the pin which ought to have held it to its spindle was there, but the spindle had fallen back into the crank case. More things had to be undone, off had to come a cylinder cover, and there in the crank case was the spindle. All had to be replaced, and then the engine had to be retimed, and all because the pin that should have held that idle distribution pinion to its shaft had not been burred over. And, to add to it all, none of the distribution pinions were marked where they should be meshed with one another.

The moral seems to be—and thus this letter—the need for better inspection of cars prior to their being sent out. If the vehicle referred to had at each stage been properly inspected, the unburred pin would have been seen and attended to, and the car and its makers would not now be the subject of many a disparaging remark by its late owner. An unburred pin is a trifle, but the neglect of this trifle caused a great deal of bother, as well as making four people go without a lunch. It was a foreign-made automobile; but I have heard that English cars have also given trouble in this way. I know "tis not in mortals to command success," but let us hope motor manufacturers will at least try to deserve it, and, anyway, see that their pins are well burred over.—Yours truly,

H.

THE PROCEEDINGS AGAINST LORD BERKELEY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are instructed by Lord Berkeley to inform you that immediately upon being served with what purported to be a summons to appear before the Oxford city magistrates his Lordship consulted us

The Electrical Motor Fire Engine recently put into service by the Fire Brigade at Dusseldorf, Germany.

motorists and their cars from Hull to Holland; also in the same issue a photograph of a car being put on board the steamer for transit between Plymouth and Brest.

Having recently availed myself of the former route, I would like to point out that the method of shipping the car is not only more up-to-date and safer, but is unattended by risk of damage to the appearance of the car.

The North Eastern Co.'s method of running the car on to a tray on which it is slung into the steamer is admirable.

My own car was thus slung into the steamer at Hull, and also at Rotterdam for the return journey, early in August this year, without receiving the least trace of damage from handling.—Yours truly,

J. E. HODGKIN.

A TALE OF A TRIFLE: ITS CONSEQUENCES AND MORAL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—
"Oh! she is all perfections,
All that the blooming earth can send forth fair."

Can we say that of the modern car? I knew a happy owner who thought so of his. He had a bitter awakening. His was a four-cylinder, double ignition, live axle, up-to-date machine, and she could and did go. Alas! one day his pride came to a fall. He was touring, and came to a forest, and in a most lonely part thereof the car stopped. The commutator spindle ceased to revolve, the magneto and pump shaft did not go round, the valves no longer lifted! What consternation! and the owner was alone with his prodigy and three lady guests and miles from any aid or luncheon

upon the matter, and we at once advised him that the proceedings were, in our view, illegal, and that any further proceedings taken thereon would be bad.

We are instructed, therefore, to state that it was for the above reason that Lord Berkeley from the first abstained from appearing before the magistrates.—Yours truly,

ANDREW WALSH, GRAY AND CO!

A MAGNETO TROUBLE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "Magneto's" letter in the last issue of the journal having reference to the red fibre strip in the distributor fitted to his Nilmelior magneto, we did fit a certain number of magnetos in this way in the earlier days. We found, however, that it was the common practice on the part of the owners to clean the distributor with a piece of emery, and that particles of the emery became embedded in the fibre and thus caused short circuiting; consequently we dispensed entirely with the red fibre, and have not fitted this for some years.—Yours truly,

For Nilmelior (England) Ltd.,

W. R. ELDERFIELD, Manager.

REFERRING to a review of the Encyclopedia of Motoring in last issue, a correspondent suggests its value would have been enhanced by the publication of a plan of a chassis.

A READER of the M.C.J. would be glad to hear from any other readers having the following issues (unbound) which they wish to dispose of:—Nos. 1 to 42, 44, 46 to 49, 51 to 54 56 to 71.

CLUBS AND ASSOCIATIONS.

ROYAL.

THE Cleveland Branch of the Yorkshire A.C. has resolved to become associated with the R.A.C.

A meeting of the organising committee was held at the club house on the 22nd inst., and the associated clubs were well represented. The principal business before the committee was the scheme for dealing with inconsiderate driving, and a number of details in connection with the operation of the scheme were settled. It has been resolved to ask the associated clubs to specially communicate with the Justices of the Peace and other judicial authorities in their districts in order that they may be informed as to the purpose and extent of the scheme.

THE MOTOR UNION.

MR. G. H. DODD presided at the October meeting of the General Committee of the Motor Union. Report was made as to the action taken in nine complaints of inconsiderate driving against outside motorists.

The receipts for the nine months ended September 30th totalled £11,026, as against £9,370 for the same period last year. In addition the foreign touring department has received deposits amounting to £4,193 for Customs charges.

Complaints having been received of the danger incurred by road users in consequence of cattle being driven on the highways after dark, it was decided that when the Lights on Vehicles Act again comes before Parliament an endeavour should be made to embody a clause requiring such cattle to be preceded by a light after sundown.

Hon. local correspondents were appointed as follows:—Shipley, Yorks, Mr. F. Hannam; Aberdeen, Mr. Lawson Turnbull; Thame, Mr. B. H. Andrew; Biggleswade, Mr. F. A. Maythorn; Bridgnorth, Mr. H. T. Skelding.

Motor Union medals were granted to the Blackpool and Fylde, Berkshire, Southern and West Essex clubs. The committee agreed to hold a provincial meeting in South Wales next year.

During September forty-six hotels and thirty-three repairers received the recommendation of the Touring Committee, and it was agreed that recommended repairers should be asked to exhibit in their window the current price for petrol.

The Motor Union Cycle Committee reported that seventy-two motorcyclists had joined under the 10s. 6d. subscription, and seventy-eight under the guinea subscription.

The following appointments as solicitors to the Motor Union have been made:—Farnborough (Hants), Mr. G. Brook Knight; Wisbech, Mr. A. Frank Whittome; Colwyn Bay, Mr. Francis Nunn; Ruthin, Mr. W. O. Jones; Llanrwst, Mr. A. Lloyd Griffith.

MOTOR CLUB.

SIXTY new members were elected at the last committee meeting. The semi-final of the golf tournaments will be completed to-day (Saturday). Dr. W. G. Grace is still left in the club handicap, and Mr. Schlentheim in the Bisque Tournament, for which he is kindly presenting a silver cup.

There will be a house dinner on Wednesday, November 18th, with Mr. Charles Jarrott in the chair.

AUTO-CYCLE UNION.

THE Stanley Show is to be held at the Royal Agricultural Hall, from Friday, November 20th, to Saturday, the 28th. The Auto-Cycle Union will have its stand in the same position as last year, where the secretary and other officials will be in attendance or can be seen by appointment.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

AT the first ordinary general meeting of the session of the Graduates' Section of the Incorporated Institution of Automobile Engineers, held at 1, Albemarle Street, Piccadilly, W., a paper was read by Mr. E. D. Suggate on "Super-heated Steam as applied to Road Vehicles," illustrated by lantern slides and also by the actual parts of various makes of steam cars. This was given in our last issue. An animated discussion followed, in which Messrs. C. E. House, P. Bishop, L. H. Baskerville-Cosway (hon. secretary of the London Branch), D. J. Smith, L. H. Hounsfield, H. Caudwell, Vernon Jones, J. H. P. Daman, H. Burchall, and the president (Mr. Dugald Clerk) took part.

BLACKPOOL.

ON Saturday the Blackpool and Fylde A.C. held a gymkhana on the Agricultural Show Ground at Blackpool. There was not a large attendance of the public. There were nineteen competitors, who figured in most of the events.

The results were as follows:—Backing into home: 1, A. E. Crowdy (Manchester); 2, C. E. Oliver (Manchester). Balancing: 1, A. E. Crowdy; 2, Mrs. E. A. Riley (Haslingden). Musical chairs: 1, H. Ingham (Oldham); 2, Mrs. Riley. Blindfold driving: 1, H. Ingham; 2, H. Walker (St. Annes). Academy stakes: 1, E. Allen (Bowden);

2, Mrs. Riley. Obstacle race: 1, E. Allen; 2, A. Birtwistle (Burnley); 3, H. Walker. Nightingale competition: 1, E. Allen; 2, C. E. Oliver. Slow race: 1, J. V. Marchanton (Lytham).

The special prize of £10 and medal of the Motor Union was won by Mr. E. Allen, of Bowden.

LINCOLNSHIRE A.C.

REPORTS were received concerning the level crossing at Hubbert's Bridge, which the G.N. Railway Company had now put in good order, and the level crossing at Weelsby, near Grimsby.

A scheme for the registration of owners of motor-cars in the county of Lincolnshire willing to render assistance in case of mobilisation of the Territorial force was discussed and adopted.

SOUTHEND.

THE committee of this club has adopted the following resolution:— "This committee, who had decided to give to the members of the club from the 1st January, 1909, the desirable benefits of association with the Royal Automobile Club in addition to those benefits accruing from continued affiliation to the Motor Union, greatly deplore the decision of the R.A.C. not to associate any club owning allegiance to more than one central body. Considering that, in view of this decision, the provincial clubs must either abstain or be compelled to take sides, against their will, the committee of this club are of opinion that the R.A.C. resolution, by forcibly dividing forces still further, is not conducive to the welfare of the automobile movement in this country."

SEVERAL prominent and energetic members of the Motor Club have urged upon the committee the desirability of starting an aerial branch.

ROAD REPORTS.

EAST HAM.—In the spring of last year a length of road in this district was treated with "Dustabato" under the instruction of Mr. A. H. Campbell, M.I.C.E., the Borough Surveyor. "Dustabato" consists of a composition of pitch and other materials which is poured in a boiling state upon the freshly rolled area of macadamized surface, the flux flowing over the surface into the interstices between the stones, the whole surface being thereafter rolled with a heavy roller until consolidated. It is the same formation as was recently applied to the front of the Houses of Parliament, and so far it has given satisfaction in East Ham.

HIGH WYCOMBE.—The Local Government Board inspector is to hold an inquiry into the application of the Town Council of High Wycombe for a ten miles per hour speed limit to be imposed on some of the main roads through the town.

ABERDEENSHIRE.—The Road Board of the Aberdeen County Council have recommended the limitation of the maximum speed of motor vehicles to fifteen miles an hour, but, after discussion at the meeting of the Council, this was referred back for further consideration.

REDHILL AND HORLEY.—Long Bridge, near the 25th milestone from Charing Cross, and between Horley Church and Povey Cross, is being rebuilt. Motorists from London should take the right-hand road at Gatton Point, before reaching Redhill, and drive via Reigate. If, on the other hand, they really desire to go by Horley, they should, on reaching the Chequers Inn at that place, proceed straight forward over the railway-bridge and thence via Pound Hill, Balcombe, and Cuckfield, joining the main Brighton road near Bolney.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

DRAKE AND GORHAM, LTD.—At the annual general meeting of Drake and Gorham, Ltd., held at the office, 66, Victoria Street, Westminster, S.W., the chairman, Mr. B. M. Drake, M.I.E.E., said that the motor-car business in this country had been less brisk than during the previous year, and they had naturally felt the effects of this. They had, however, bought and tested a number of cars for clients who were glad to avail themselves of their services where they had not technical knowledge themselves, especially in view of the fact that these services cost them nothing. A pamphlet on the subject, called "The Choice of a Car," had been prepared and circulated during the year.

SUNBEAM MOTOR CAR.—The directors, after adding £1,500 to the reserve fund and placing £200 to bonus fund, recommend a dividend of 7½ per cent., tax free, on the ordinary shares for the year ended August 31st. A balance of £904 remains to be carried forward.

AT the Franco-British Exhibition the Coventry Chain Company have been awarded a silver medal.

MESSRS. C. E. WHITTAKER, LTD., 66, Great Russell Street, W.C., are putting on the market a new speedometer; it will be known as the Imperia, and will be essentially for the man of moderate means. The device, which will be jewelled to ensure accuracy, will be gear driven, and the maximum speed it will register will be fifty miles an hour. Larger models, however, can be put in hand on request.

THE VALVELESS ENGINE.

At the meeting of the R.A.C. on the 22nd inst. the discussion on Mr. C. Y. Knight's paper was resumed by Mr. Alexander Craig, who dealt with some of the points advanced in favour of the new system. With regard to silence he submitted that they should judge of that in twelve months' time, when the engine had been on the road and had been built in quantities. As to the claim for smoothness, the superiority of the engine had been ascribed to the absence of cams, which at speed produced a tremor throughout the car. He (the speaker) submitted that Mr. Knight was entirely wrong in that. The tremor at speed was due to a well-known principle in the four-cylinder engine—a slight want of inertia balance of the main reciprocating parts. The piston speed in the first half of its stroke was not the same as the piston speed in the last half of its stroke, by reason of the length of the connecting-rod, and that brought about a slight want of balance that was not present, of course, in a six-cylinder; in addition, there were explosion balances to consider, but as far as that was concerned, they had a four-cylinder engine put before them which was claimed to be more free from vibration. Mr. Knight claimed a better balance than the old four-cylinder engines. Given the same weight of reciprocating parts, he (the speaker) submitted that it was impossible that there should be a difference. As far as inertia disturbance was concerned, the weight of the parts moved by the cam was so small that that must be absorbed in the general mass of the engine and never reach the occupant at all. He was assuming that it was

The Daimler 38-h.p. 1909 type car, fitted with the new silent engine, which lately made a non-stop run of 650 miles.

now a well-designed engine of recent date. The flexibility was not due to any special design of the engine beyond the form of the combustion chamber, which was not peculiar to that particular engine. With regard to endurance he did not think the author had fully appreciated what had been done in recent practices with the ordinary engine. Reliability yet remained to be tested. He was not going to prophesy that the engine could not work, but he was going to draw attention to points that were against it in connection with reliability. The opening of the valve was made by uncovering the junk ring, when the sleeve passed below that junk ring, and while the exhaust valve was open it had to stand the blast of the discharge. Those who knew anything about a piston valve with superheated steam knew that they did not get on any too well, that it was not unusual to find them soiled by the dry gas, and he did not think they could look for petrol vapour to be any more gentle. Turning to another point, he thought that there must be more mechanical loss in that engine. Mr. Knight mentioned a test on the dynamo which proved that the mechanical efficiency was 87 per cent. He would like to know on what principles that test was carried out, and by what means he established its efficiency.

Mr. S. F. Edge asked if Mr. Knight had ever ridden in a modern six-cylinder car, and went on to refer to the various records of the R.A.C. with regard to flexibility, reliability, and other points for which tests had been made. Each claim put forward by Mr. Knight was categorically dealt with, and, to sum the whole matter up, he went on to say, Mr. Knight had made eleven claims. Six of them by official

test were quite wrong; he was utterly beaten on official tests recorded by that Club. The other five he left to him, because he had no official record to bring forward to disprove them.

Lord Montagu referred to the test he had made of the Knight engine on French roads, 529 miles of which had been traversed under his own personal observation. The average consumption had been about 13½ miles to the gallon, and during a great portion of the time he was running the car "all out" in order to test it at high speeds and the three jets were all brought into play. When running more steadily at 30 to 40 miles an hour the engine averaged about 15 to 17 miles per gallon. The difference in flexibility and silence of the new engine and of the six-cylinder is very hard to tell. At high speeds Mr. Knight's engine was possibly more silent, and the absence of engine vibration at high speeds was a remarkable feature. As regards lubricating oil, one gallon was used in addition to some that was in the car at the time it started. The characteristics of the engine seemed to be great flexibility, exceeding that of any other four-cylinder engine with which he was acquainted; noiselessness, especially marked when under way and running at high speed, and great power of picking up when a hill had to be negotiated, or when, after a slack for traffic, speed had to be attained again to get out of traffic.

Mr. F. R. S. Bircham said it was quite a new theory to him that oil would transmit more heat if kept moving. They were told that a piston was cooled by the oil filaments being kept moving between the pockets and practically acting as metal. He did not know what size that type of engine had been built to, but he very much doubted if it was possible to cool the piston for 6 in., and certainly not more than 8 in., in diameter. The actual number of parts in Mr. Knight's engine, owing to the cam shaft being made in two pieces, which was not obvious unless closely examined, was 112. In the ordinary type of four-cylinder engine with valves, as he suggested, the parts were ninety-nine. That figure included the valve springs. If they added valve cotters and washers, it was 115, which was three more. But he thought that that disproved Mr. Knight's claim to fewer parts and cheaper cost.

Mr. H. Austin believed that the tests given by Mr. Knight were really insufficient. Ten years ago they might have been considered quite severe, but to-day they were not very much. A client of his (the speaker's) told him once that, although he was quite ashamed to say it, he had never ground the valves, and he had driven 15,000 or 18,000 miles. It was quite as good as it was in the first place. There was nothing unusual in running 10,000 miles without grinding the valves, keeping them, nevertheless, in quite good order in a well-designed machine. He should say it was quite usual to run 10,000 miles without having any leak whatever in the valves. The engine would probably be better with regard to compression at the end of the time than at the start, if properly cared for. Few manufacturers got valve trouble to-day; the trouble was infinitesimal. For the last four or five years he had never replaced a valve, and he had never heard of one breaking on an engine he had made. Looking at the design from a purely theoretical standpoint, he did not think that it would enable Mr. Knight to claim greater power or efficiency than, say, an engine where the cylinder had got the valves in the head opening into the combustion space. He could not see how any system could be better purely on the score of efficiency; consequently he could not see how it could be better on power, because the cylindrical valves took a great deal more power to drive than the ordinary poppet valves.

Mr. W. Worby Beaumont mentioned that the points with regard to the construction of the engine showed that Mr. Knight had a design that should give them certain thermo-dynamic advantages as compared with the ordinary engine. Whether it were an advantage or not, so far as construction was concerned, he was enabled by means of his tubular sliding valves to get a period and length of duration of admission of his gases and of exhaust, which was of considerable advantage as compared with the periods of duration in most of the engines in ordinary use. There could be no doubt that he should get an advantage in the working of the engine which, so far as the thermal conditions involved were concerned, should give an economical result. Whether the mechanical efficiency of the engine were much higher, or any higher, than with an engine constructed with the ordinary poppet valve was a matter that really they were not in a position to determine at present, inasmuch as, so far as he knew, no actual and trustworthy indicator diagrams had been taken of an engine of that design. Of course, it was possible, by the method that had been mentioned, to obtain an estimated indicated h.p. by taking the power of the engine at different outputs, and so arriving at an estimate such as the one that had been given of 87 per cent. He was not, however, quite satisfied that that, whether it were much greater or less than 87 per cent., was an estimate that they could rely upon at present.

Mr. Percy Martin said he had many results that even Mr. Knight had not seen himself, which had led them to the decision to take on the engine. It was a beginning. Mr. Knight had been on it for five or six years, but he had been single-handed. A great many people would be engaged on those lines in the course of the next two or three years, and a great many improvements would be made; they did not claim to have reached perfection. He agreed with Mr. Austin that gears for driving the shaft of the engine would give trouble in the best regulated engine. To get rid of them by means which they considered, from some experience they had had, to be quite satisfactory he would suggest putting in new links with a new chain. He was not going to tell them a good deal as to cost of manufacture, but he might say that the estimates up to the present time were quite satisfactory. The chief beauty of the

manufacture was that they got more round work in building that engine than one did in the old type engine. They got more finished work direct from the machine, and eliminated a great many of the costly operations under the head of fitting. As a manufacturing proposition he would much rather build the new engine than the old. It was a prettier proposition to tackle with the machine shop that they had at their command. He thought that results would prove the advantages in machining and manufacture as it would prove that the machine was reliable. He thought consumption on the road and flexibility could be eliminated from the discussion. The Daimler Company had gone far enough into the question of reliability, and he believed they would guarantee it to the satisfaction of everybody who was inclined to risk it. They could not, of course, say that they had had six years' experience in this country under the observation of the R. A. C. and so forth; but, no doubt, as time went on they would take up all those points and hope to prove that they had an advantage over the existing type.

Mr. Knight replied. So far as he knew the Daimler Company had laid down 600 of these motors. A record of 2,212 miles run by one of these motors had shown an average of 17½ miles to the gallon, the lubricating oil working out to 512 miles to the gallon. Mr. Knight dealt with practically all the points that had been raised, and received a very hearty vote of thanks from the meeting.

BENZOL AS AN AUTOMOBILE FUEL.

THE utility of benzol as a fuel for the engines of motor-cars has recently been made the subject of two papers by M. A. Grebel, the first a discussion of the relative merits of benzol and petrol, published in "Le Genie Civil," and the second a very comprehensive paper covering thoroughly the whole subject, read before the Société des Ingenieurs Civils de France. The following notes are taken from these papers.

Almost all benzol is produced as a by-product in the manufacture of coke, the process of extraction from the waste gases consisting of dissolving the crude benzol in heavy oils and later recovering it from the solution by distillation. It is then rectified by the removal of carbon bisulphide, tar, naphthalene, and other impurities, and a final purification is obtained by washing with acids, soda, and other reagents. If the benzol is intended for use in automobile motors, this purification must be very carefully performed. If it is improperly carried out tarry products are left which interfere with the proper working of the carburettor and give rise to obnoxious and corrosive fumes. About five kilogrammes of rectified benzol are recovered per ton of coal coked. In the present state of the industry, France, Germany, England and Belgium produce large quantities of benzol annually, but the amount could be largely increased in all countries, so that the present price of about 10d. per gallon could be maintained even though the demand were to increase to very large proportions.

The comparative physical properties of benzol and petrol are as follows:—

| | Benzol. | Petrol. |
|---|------------------------------------|---------|
| Density | 885 | 700 |
| Calorific power | Calories per kilogramme. 10,033 | 11,464 |
| | Calories per litre. 8 879 | 8,025 |
| | Degrees C. -6 to -8 | -100 |
| Freezing point | | |
| Quantities of fuel added to 1 litre of air at 0 deg. C. and 760 mm. for theoretically complete com- bustion | Grammes 0.9615 | 0.8434 |
| | Cubic centimetres. 1.0864 | 1.205 |
| Vapour tension at 20 deg. C. ... | 122 | 296 |
| | Degrees C. 81 | 50 |
| Temperature of boiling | | |

The close similarity between benzol and petrol has been the cause of many disappointments and vexations. It has led to the belief that benzol could be simply substituted for petrol without any difficulty, and it must be admitted that by accident certain motors have worked well for a time within certain narrow limits of speed. In cases where bad results have been obtained, however, they have been hastily and erroneously attributed to the fuel itself. Benzol, indeed, presents many points of similarity to petrol, but it is distinguished from it by various characteristics, of which account must be taken in the design of carburettors, the regulation of ignition, &c.

The principal charge made against benzol is that it causes fouling, but the black smoke, the odour of burned gases and the fouling are due entirely to imperfect combustion. M. Grebel has made upwards of 200 tests on a Panhard motor and has never encountered any fouling except when testing a benzol only 50 per cent. pure. It is an easy matter to prevent fouling, because, in order that a deposit of soot may be formed, it is necessary that the proportion of benzol in the fuel should be raised to double that theoretically necessary for complete combustion. Many carburettors, however, make an explosive mixture imperfect to a degree that would be believed impossible without the striking evidence of analysis of the waste gases. The influence of the mixture on the efficiency of the benzol motor cannot be too strongly emphasized. Even when the exhaust gases are colourless and odourless and the motor seems

to be working perfectly, the combustion and consequently the efficiency may be relatively poor.

M. Grebel's investigations have shown that the minimum specific consumption corresponds to a percentage of carbon dioxide in the exhaust gases of 14 in the case of petrol, and 17 in the case of benzol, without excess of oxygen and without carbon monoxide. These are the highest percentages attainable in practice, though the theoretical percentages for complete combustion are 14.4 and 17.4 respectively. The maximum of power is found at about the point of maximum explosibility which corresponds to the highest explosive pressure. This is given by a mixture slightly richer in benzol than the mixture for theoretically complete combustion. With the mixture giving maximum power, about 1½ per cent. of carbon monoxide is found in the burned gases. In M. Grebel's tests the minimum of consumption has always been found to be attained when the air actually introduced bears to the air theoretically necessary the proportion of 1 to 1.1. This differs considerably from the proportion of 1.3 to 1.7 recommended some years ago by Sorel and adhered to by many builders through fear of a shortage of air under certain conditions.

GUARDING AGAINST GARAGE FIRES.

DECLARING petrol to be "an enemy of life and property far more terrible than dynamite, gun-cotton or nitro-glycerine," Mr. J. A. Archibald, fire chief of Cincinnati, U.S.A., at a recent convention of chiefs of fire departments, proposed a complete set of garage regulations which are of interest as embodying the ideas and experience of a veteran fire-fighter who has made a special study of garage phenomena and the things that happen as a result of the peculiar qualities of petrol vapour. Its greatest danger, he declared, lies in the fact that the unseen vapour "hunts its way into every crevice, driving out the air with its heavier weight and finally reaching its opposing force with that death-dealing effect only too well known to the fireman." After discussing some of the chemical and practical aspects of petrol, Mr. Archibald offered his suggestions for rules for garage conduct and regulations for equipment that to his mind are calculated to protect alike the garage, its patrons, its neighbours, and the public. His recommendations take the form of a proposed ordinance, which, in addition to the usual provisions, contains one or two suggestive and valuable ideas in this connection, some of which are outlined below.

No garage should be carried on except in a fireproof building not more than three stories high. No garage should be maintained within the same square with hotels, theatres, school houses, hospitals, or other buildings designed for public purposes, nor in any building of which any part is used as a dwelling. Heating should be done by steam or hot water; the boiler room to be fire-proof, and all openings between it and other parts of the garage to be protected by double "standard" doors; there should be no stoves, forges, torches, or furnaces, and no open flame fire, except as provided in the fire-proof boiler room. No lights, except electric incandescent lamps, properly enclosed in vapour tight globe, protected by approved wire-guards, should be allowed in any garage.

All volatile substances should be stored in closed tanks. None of the latter should be placed, constructed, or maintained under a public sidewalk or in a sidewalk area. All tanks should be constructed of steel and coated on the outside with tar or other rust-resisting material. The material of which they are constructed should be at least 3-16 in. thick. No tank should have a capacity in excess of 250 gallons, and all joints must be tightly caulked. They should be so buried that no part of the top shall be less than 2 ft. beneath the surface of the ground at the point where the tank is located; they should be completely cased, and surrounded with 12 in. of Portland cement, and all fire or lights on motor-cars should be extinguished upon the entry of the vehicles into the garage within 10 ft. of the threshold, and should not be lighted while they are in the garage. Movable incandescent lights in the garage should be protected by vapour-tight globes, inclosed in approved metal guards, and should be fitted with keyless sockets, and all electric switches and cut-outs should be permanently located at least 4 ft. above the floor and in an approved cabinet. No person should smoke in the garage. The reason for such restriction is quite obvious. Therefore, a notice in large letters, to read, "No Smoking," should be kept displayed in a conspicuous place and manner on all floors and at the entrance of all garages. No volatile inflammable liquid should be used in a garage for cleaning or for any other purpose whatsoever other than filling the tanks of such vehicles. No such liquids should be allowed to run upon the floor or to fall or pass into the drainage system of the garage.

On the floor of every garage there should constantly be kept and maintained convenient receptacles filled with sand, to be used in absorbing waste oils on the floors. In addition, sand should be kept on every floor in boxes or buckets of approved construction, provided with hand-scoops, to be used for fire-extinguishing purposes only—one such box or bucket for 800 square feet of floor area or fraction thereof. Beds of sand, or metal drip pans filled with sand, should be placed under every vehicle kept on the floors that are not fireproof. One 3-gallon carbonic acid gas fire extinguisher of approved construction should be provided and conveniently located for each 1,000 square feet of floor space, or fraction thereof. Self-closing metal cans, set firmly on 4-inch legs, should be kept on the floors of every garage, into which all inflammable waste material should be deposited.

THE EFFECT OF MOTOR VEHICLES ON MACADAM ROADS.*

By LOGAN WALLER PAGE, Director Office of Public Roads, U.S.A.

It is to Tresanget, engineer-in-chief of the district of Limoges, that we are indebted for the first scientific treatise on broken stone road construction. He clearly specified several types of broken stone roads, one of which, in quite general use throughout England and America to-day, is known as the Telford. It is a matter of interest that while roads of the Tresanget type are in extensive use throughout England and America, they are rarely seen in France, the macadam type having almost entirely superseded it. Tresanget's report to the Council of Bridges and Roads, written in 1775, on road maintenance is, in my opinion, the best ever written on the subject. Following Tresanget, McAdam made his splendid contribution. Since the time of these great engineers many improvements and modifications have been made in road building, the most important of which have been largely brought about by time and labour-saving machinery.

It is not my purpose to consider the history of road building, and I have only alluded to it for the purpose of showing that the broken-stone road of to-day has been of slow development. Although the methods of construction vary somewhat in different countries and different localities the main object sought has always been the same—to withstand the wear of iron-tired horse vehicles at a reasonable cost. Until the last decade these conditions have been successfully met and the broken-stone road was all that could be desired. Under modern motor traffic, however, the conditions have changed. Roads which formerly withstood the wear of horse vehicles are now quickly denuded of the fine binding material, and become loose and disintegrated. On the principally travelled roads the great clouds of dust raised by rapidly moving motor vehicles are not only a great waste of the material of which the road is composed, but this dust is carried by the wind and disseminated over adjacent property to such an extent that it has, in many instances, affected the value of real estates as well as the comfort of near-by residents and pedestrians. The road surface becomes so loosened that water makes its way to the foundation, and in general the cost of maintenance has very greatly increased.

With a constantly increasing motor traffic, these are, briefly, the conditions we find to-day, and which have to be met. The problem is such a serious one that it has called forth the best efforts of highway engineers in every civilised country. By the proper use of bituminous materials the mechanical difficulties have in a large measure been overcome, but the cost of such treatment is so great that it is hard to believe, at present, that such methods can ever be generally used on the many thousand miles of rural highways affected. As already stated, the broken-stone road has been developed to withstand the wear of iron-tired horse vehicles, and has met successfully the demands of suburban and rural traffic until the advent of the motor vehicle. When in its highest state of perfection, the rock from which such a road is made is so suited to the volume and character of traffic which passes over it that the amount of dust worn off is only sufficient to replace that removed by wind and rain. The dust remaining should be just enough to bond the surface stones thoroughly, forming a smooth, impervious shell. A road of this character wears uniformly under the traffic for which it was designed, and when properly maintained always presents an even surface.

When such a road is subjected to continuous fast motor traffic, entirely new conditions are brought about. Since the advent of this new traffic its effect on the road has been the subject of much study by both highway and mechanical engineers, and many highly interesting and ingenious theories have been advanced to account for the injury to roads derived from it. While the slipping of the tyre, skidding, shape of car body, suction and other causes contribute more or less to the injury of the road surface, I think it is quite generally agreed that the suction of the pneumatic tyre on the surface is the main cause of the trouble. The object of this paper is to show, however, that the great tractive force, or shear, exerted by the driving wheels of motor-cars is the main factor of injury. It has been demonstrated by connecting both front and rear wheels of motor-cars with separate speedometers that there is a considerable amount of slipping of the driving wheels on the road surface, and, on account of the numerous irregularities on the average road surface, this is what should be expected. This slip, due to the decrease in the bearing surface of the tyre, undoubtedly increases the amount of finely divided material of the road surface thrown into the air. The increased amount of damage done on this account will be in proportion to the irregularities in the road and the speed of the car. While it is an important factor, its effect is greatly reduced if the road has a smooth surface.

The effect of skidding is only observable on roads that are subjected to a considerable volume of fast motor traffic, and only then on curves. The result of this is to shift the crown of the road tangentially to the gutter. While very annoying to those having the maintenance of such roads, it is not one of the serious or costly causes of injury, as it is generally confined to rather sharp curves. It is my belief that too much stress has been laid upon the effect of the car body and its shape in removing dust from the road surface. After a number of experiments and observations, I am now convinced that little or no dust is removed

from the road surface by this means, except on very dusty roads. The dust lifted by the wheels, however, is greatly accelerated by the action of the car body and the air currents set up in its rear, which has much to do with the dissemination of dust. This is one of the important factors to be considered, as much of the dust lifted by the wheels would not be carried from the road but for the air currents developed by the car body, and these, of course, are much affected by its shape.

Probably no single factor has been considered of as much importance as the so-called suction of the pneumatic tyre. Some writers have even gone so far as to maintain that a slight vacuum is created in the rear of each tyre, which is sufficient to lift the finer particles of the road surface in the air. In my opinion, entirely too much importance has been given to this phenomenon, for, if it exists at all, its effect is probably so slight that it can be considered a negligible quantity, and I shall endeavour later on to give my reasons for this view. Beyond a doubt, the most injurious action of motor traffic is the great tractive, or shearing, force exerted by the driving wheels of these cars. The fine dust which ordinarily acts as a cementing agent to the road surface is thrown into the air to be carried off by the wind, or that remaining on the road is so loosened that it is easily washed into the gutters by rain. The pneumatic tyre wears off from the broken stone of the road little or no dust to replace that thus removed, and the result is that the stones become loose and rounded, giving the greatest resistance to traction and allowing water to make its way freely to the foundation of the road.

For the purpose of studying this phenomenon I recently conducted a series of tests with motor-cars of various shapes and sizes, from a heavy limousine to a small run-about. These cars were run at various rates of speed, and their effect studied on a section of average broken-stone road. The most interesting result was obtained with a 60-h.p. car stripped for racing. The wheels of this vehicle were 36 in. in diameter, with 4 in. front and 4½ in. rear tyres. The weight of the car with driver and mechanism was 2,800 lbs. The vehicle was driven over a level section of broken-stone road at speeds varying from 5 to 60 miles an hour. The road used was a section which had been resurfaced two years previous to the test and was in very good condition. Up to fifteen miles an hour little or no effect was produced on the road, and even at twenty miles it was judged by those present that no serious damage was done. From twenty miles an hour on, however, the effect was markedly noticeable with each increase in speed. At a point on the road designated for the proper speeds, photographers with the necessary high-speed cameras were stationed for the purpose of taking photographs from different points of view of the effect produced. I have some photographs which I think illustrate the action of the wheels very clearly. They show the car travelling at various rates of speed from five to sixty miles an hour. The chief point of interest in these photographs is the difference in effect on the road between the front and rear wheels. Now, if it is true, as has been claimed, that a vacuum is formed in the rear of the pneumatic tyre, or that it possesses any power of suction, this should be equally true of both front and rear wheels. I am convinced, after most careful observation, that this is not the case, and I think this point is illustrated by the photographs.

To sum up the matter briefly, the pneumatic tyre, or any type of tyre which propels a vehicle, must have sufficient tractive resistance to overcome the load of the vehicle. This, of necessity, must cause a shear on the road surface, which varies with the weight and speed of the vehicle. The broken-stone road surface has little power to resist a shearing stress, consequently the fine material of which it is composed is thrown into the air. Once lifted from the road, this fine material is subject to the effect of air currents generated by the car body, and subsequently by the wind. In this manner large quantities of the material of which the road is composed are carried from the road and must eventually be replaced or the road will rapidly deteriorate. This action may be greatly accelerated by other causes, but in the main it is sufficient to account for the observed results. Apart from the dust carried from the road in this manner, this shearing force of the motor-car has a decided disintegrating effect on the surface of the road.

"SCHOOL" FOR CHAUFFEURS.

At the Essex Quarter Sessions, Walter Carlyon, of Stapleford Abbotts, described as a gentleman, was sentenced to six months' hard labour for obtaining ten guineas by false pretences. Prisoner, who possessed a dilapidated motor-car, started a school for chauffeurs. Prosecutor, Cecil Stones, of Brixton, was taken out on an ancient motor-car, which broke down every time it was used, and had to be pushed home. At the end of a fortnight prisoner told him he was a qualified chauffeur, but prosecutor knew better, and the police were communicated with. Prosecutor paid ten guineas as a premium.

WE understand that a petition for the compulsory winding up of Messrs. Frank Morris, Ltd., King's Lynn, has been granted. It will probably be remembered that Mr. Frank Morris has not been identified with the business in any way for some considerable time.

FOR some time past V-type engines with their cylinders set at 90 deg. have been in use, and are now being manufactured by various firms. Until recently the only ignition possible on such motors was coil and battery, but in view, however, of the increasing demand the Bosch Magneto Company, Ltd., of 23, Store Street, W.C., have now brought out a magneto suitable for this class of engine. Full particulars will be sent on application.

* Abstract of address delivered before the Legislative and Good Roads Convention at Buffalo, U.S.A.

CASES AGAINST MOTORISTS.

DISCHARGED.

At the Surrey Quarter Sessions at Kingston, on the 21st inst., Edward Toms, of North Haven Point, Parkstone, Dorset, surrendered to his bail on an indictment charging him with wantonly and furiously driving a motor-car, and knocking down Alfred Berry, thereby causing him grievous bodily harm, at Long Ditton, on September 3rd. The evidence given by eight witnesses at the police-court was repeated. Berry was running in line with a cart laden with Thames ballast, of which he was in charge, when the prisoner's car knocked him down and inflicted serious injuries upon him, including concussion of the brain. Berry had subsequently to be removed to the county lunatic asylum, at Brookwood, where he is now detained. The defendant, in giving evidence, said before reaching the junction of the Portsmouth and Brighton roads he sounded his horn. He denied that he was racing with another car, and no car ever came abreast with him until after the accident, when a large car passed him. As he got within thirty yards of the injured man, whom he had previously seen on the pavement, Berry suddenly darted across the road. When about half-way across he hesitated, and witness applied his brakes. Then Berry stepped aside, and the witness released his brakes, as he was then clear of him, but Berry stepped in front of the car. As witness was within three or four feet away, the car skidded on the greasy road. At the time of the accident his pace was about fourteen miles an hour. After other evidence, the jury retired, and eventually returned a verdict of "Not guilty," defendant being thereupon discharged.

MOTOR-CAR BRAKES.

In the King's Bench Division, before the Lord Chief Justice, Mr. Justice Bigham and Mr. Justice Walton, an important decision with respect to motor-cars and their construction, given by the Divisional Court in the case of *Wilmott v. Southwell*, has been appealed against. Mr. Hogg explained that the case was an appeal against the conviction of Wilmott for driving in London a motor mail van, which was not fitted with two independent brakes as required by the regulations. The van had a brake which operated on the wheels. The wheels were driven by a broad leather band, and when the engine was cut off, the belt formed a very powerful brake.

The Lord Chief Justice: It means the wheels drive the engine instead of vice-versa. There has been a great deal of controversy about the matter. Some people think a great deal of harm is caused by using the engine as a brake, and others think it is a very good thing. He expressed the opinion that the case was too clear for argument. The regulations required two independent mechanical devices, and not the engine as brake and one mechanical device. The magistrate was right in convicting, and the appeal would be dismissed.

A DRIVER DISQUALIFIED.

At Chelmsford, R. H. Green, of Plaistow, was charged with driving a motor-car in a dangerous manner at Margareting. Mr. Suthery, for the prosecution, said the defendant hired the car to demonstrate its merits to a prospective purchaser. The defendant, who had been previously convicted of dangerous driving, was fined £2 and costs £2 14s. 6d.; his licence was suspended until February 23, 1909; and he was declared disqualified from obtaining a licence for eighteen months from that date.

One of the Austrian-Daimler 35-h.p. vehicles built for the public service between Neumarkt and Predazzo, in the South Tyrol.

SUMMONS AND CROSS SUMMONS.

At Aldershot, Mr. James Sturrock, of Kensington, answered on the 22nd inst. to three summonses alleging that on the 15th inst., at Hartley Bridge Flats, he drove a motor-car to the danger of the public, that he obstructed the passage of the free highway, and that he committed a common assault. Mr. W. Taylor Parkes, who appeared for the defendant, applied for a cross-summons against Col. Verner, who was the complainant. The justices granted the cross-summons, and adjourned the hearing until the 5th prox.

APPEAL ALLOWED.

The magistrates at the West Riding Sessions at Wakefield have heard an appeal by John Lees, motor-car driver, Penistone, against a conviction by the West Riding magistrates at Barnsley for driving a motor-car at a speed dangerous to the public. The alleged offence took place on July 23rd, on the road at Smithies, about three miles from Barnsley, and it was stated that two cars were racing at an excessive speed, and they created big clouds of dust, which were a great danger to the public. A cyclist was knocked down by appellant's car and injured. Both drivers were convicted, but the other man had not appealed. Appellant emphatically denied that he drove at an unreasonable speed, and said the clouds of dust which were raised were due to the rough and loose road. He had held a licence since licences were granted, and had driven regularly without complaint. During the whole drive on the day in question he never exceeded twenty miles an hour. The other occupants of the car having given evidence, the Bench allowed the appeal, with costs.

ALLEGED AIDING AND ABETTING.

Sidney Samuel Ingall, of 24, Handforth Road, Brixton, was summoned at the Horsham Petty Sessions, on Saturday, for exceeding the motor speed limit of ten miles an hour at Ifield on September 21, and George Howlett, of 193, Clapham Road, London, was summoned for wilfully aiding, counselling, and procuring Ingall to commit the offence for which he was summoned. P.s. Blackman said the speed was upwards of nineteen miles an hour. Ingall admitted the offence and a conviction at Huntingdonshire for driving to the danger of the public. He was fined £3 and costs. George Howlett pleaded not guilty to aiding and abetting Ingall. P.s. Blackman said when he stopped the car Howlett remarked: "He was going by my instructions. It's the first time I've been stopped. I'm very sorry." Witness said, "Do you know you are in the ten-mile limit?" to which defendant said, "Yes, I know that." Subsequently witness saw the defendant in London, when he said that when he engaged his driver he told him he knew nothing about motor-cars, but he knew what speed was, and if he (the driver) went beyond a speed limit and got summoned he would discharge him. When the driver got home on Monday he apologised for being stopped. P.s. Lee also gave evidence. Defendant said when he was stopped he remarked to the constable, "I'm very sorry we've been stopped. It is my first experience of being stopped," and his instructions to the driver had been imperative never to exceed the speed limit. He suggested the officer misunderstood what he said. He denied having said the driver was going under his instructions. The driver was called, and said he was in conversation with the constable while the sergeant was speaking to the defendant. He spoke as to the definite instructions he had received

never to exceed the speed limit or to get into any trouble with the police. The case was dismissed, each party having to pay their own costs.

BATCHES.

On recent days batches of motorists have been fined: at Mortlake (4), Chelmsford (9), Kingston (12), Brentford (6), Farnham (2), Saddleworth (3), Woking (11), Dewsbury (4), Horsham (8), Grantham (10), Ayr (7), Newcastle-on-Tyne, (3), Bromley, Kent, (5) Feltham (2).

POLICE "CONTROLS."

AMONG the Deeside police traps lately reported to us have been those from the overline bridge which crosses the railway near the farm of Houghhead, Aboyne, to the fortieth milestone at the farm of Braehead, Tulloch, a distance of about eight miles; a distance of about seven miles, from the overline bridge to the thirty-ninth milestone; and a third over a distance of about 1½ miles, from the farm of Houghhead to Boghead, Aboyne.

SEVERAL police controls have been established on the roads about Loch Lomond.

MOTORISTS are often timed at the cross roads at Shipley, near Horsham.

SEVERAL traps are reported in the Canterbury district, notably on the road to Folkestone.

A POLICE trap was being worked on Sunday in Harston village, on the Royston-Cambridge main road.

AT Liversedge—on the Huddersfield road—is a police trap over a distance of a quarter of a mile.

THE police are assiduous in their attentions to speedy motorists travelling through Ripley village.

THE Kingstown, near Carlisle, trap is frequently in operation.

AMONG the police traps recently established in Scotland are several in the vicinity of Ayr and another in the village of Poundland, Colmonell.

THE police have measured distances through Seaton Burn, Walbottle and Stanington, all leading to the court at Newcastle-on-Tyne.

BUSINESS NEWS.

THE Calmon Asbestos and Rubber Company, Ltd., Trinity Place, Tower Hill, London, E.C., are now supplying ready cut flange jointings made in ordinary asbestos millboard, or in the tougher compressed asbestos jointing. These washers are claimed, owing to their softer nature, to be much better than copper and asbestos joints in cases where the flanges are not a perfect fit against each other, and have the advantage of being cheaper in price.

VAUXHALL MOTORS, LTD., of 157, Knightsbridge, London, S.W., have taken new premises at 180, Great Portland Street, London, W. They hope to be in occupation some time during December, and will make their first start there at the beginning of the new year. In addition to having obtained ample room for the display of chassis and complete cars of all types, the company have also at Nos. 86, 87, and 88, Bolsover Street (immediately in the rear of the showrooms) adequate accommodation for full stocks of spare parts. The 1909 Vauxhall cars will consist of three models—a 20-h.p. of the 2,000 mile trial type, a 16-h.p. vehicle similar to the above, but having an engine 80 mm. by 100 mm. and a three-speed gear-box, and a 12-16-h.p. vehicle.

THE Junior and Otav Cars Co., Ltd., 117, Long Acre, London, W.C., inform us that they have changed their telegraphic address from "Bertelli, London," to "Juniotav, London."

OWING to the fact that so many firms have adopted the word "Simplex" in connection with the name of their cars, Ariel Motor, Ltd., while believing they were the first to make use of it, have decided to drop the word altogether. In future their cars will be known by the name "Ariel" for which they have a registered trade mark which fully covers their sole right to its use for motor-cars and the like.

MESSRS. DUCROS MERCEDES, LTD., write us with regard to their exhibit at the forthcoming show at Olympia as follows:—"Up to this year Messrs. Ducros, Mercedes, Ltd., have always obtained a position in the main hall, but, on account of their refusal to sign the bond, although representing undoubtedly the finest made car and the car with the largest reputation in the world, they have been relegated to possibly the worst position in the annexe. The space allotted to us will not permit of our showing more than three cars or chassis. For this reason we are only showing one complete car, viz., 45-h.p. limousine. Of the other types we shall show chassis only, viz., 35-h.p. live axle and 65-h.p. We are arranging, however, to have a very comprehensive range of Mercedes models, with latest designs of coachwork, touring, limousine and landaulet, on view at our head showrooms, 132, Long Acre, London, W.C., during the run of the show."

THE British Petroleum Company, Ltd., has issued an excellently printed brochure on their "Shell" spirit. Therein is set forth the method of distillation and shipment and the claims made for the excellence of the fuel.

THE seventh International Motor Exhibition of the Society of Motor Manufacturers and Traders, of which the King and Prince of Wales are patrons, will commence at Olympia on November 13th and will remain open till Saturday, November 21st. The inaugural dinner takes place on November 11th in the Whitehall Rooms, S.W.

FORTHCOMING EVENTS.

OCTOBER.

31st (Sat.).—Run of the Birmingham M.C.C. to Harringdon Hall.

NOVEMBER.

2nd (M.).—Mr. R. W. Brewer at the Society of Engineers on "The Flow of Liquid Fuels through Carburettor Nozzles."

3rd (Tu.).—Hull and East Riding A.C.C. Annual Dinner.

6th (F.).—Invitation Smoking Concert of the Stanley Cycling Club at the Queen's Hall, London, W.

10th (Tu.).—Meeting of the Incorporated Institution of Automobile Engineers to discuss the report of the Society of Motor Manufacturers and Traders on Horse-power Formulae of Petrol Engines.

11th (W.).—Prof. B. Hopkinson, at Institution of Automobile Engineers, on "A Complete Test of a Modern Petrol Engine."

13th-21st.—Olympia Motor Show, London.

14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club, Hotel Metropole, London, S.W.

18th (W.).—Annual Dinner of the Motor Union.

20th-23rd.—Stanley Show at the Royal Agricultural Hall, London, N.

26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.

28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

13th (Sun.).—Closing day of the Paris Salon.

23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

JANUARY, 1909.

22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.

26th.—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

War Office Fourteen-days' Trial for Light Tractors.

LIGHTING-UP TIMES—LONDON.

| | | | | | | |
|----------------|-----|----------|-----|----------|-----|----------|
| Oct. 31st—5.34 | ... | 2nd—5.31 | ... | 4th—5.28 | ... | 6th—5.24 |
| Nov. 1st—5.32 | ... | 3rd—5.30 | ... | 5th—5.26 | ... | 7th—5.23 |

To find the approximate lighting-up time in November for Birmingham 5 minutes should be added to the above times, 5 for Manchester, and 8 for Glasgow.

AUTOMOBILE ACCIDENTS.

DR. S. FRAZER, medical officer at Brentwood, and a member of the Billericay Rural Council, was being driven in a motor-car near Hedley Common by Mr. Daniel Cornish, when the car suddenly broke down and both gentlemen were precipitated into the roadway. Dr. Frazer fractured his left wrist, while Mr. Cornish severely injured one of his arms and was otherwise cut about. Assistance was rendered, and they were conveyed home.

ACCORDING to Mr. H. Gladstone, the number of motor-car accidents during the months from January to September of the present year was 2,945.

WHEN walking in Verulam Road, St. Albans, on Sunday night, a young couple were knocked down by a motor-car. It is stated that the occupants of the car drove on towards London, although people standing by called out to them to stop.

A SERIOUS motor smash occurred early on Tuesday morning in the vicinity of Kirkstall Abbey, Leeds. Entering Abbey Road there is a rather awkward bend, and the driver of the car failed to keep it in the middle of the road. Skidding badly on the back wheels on the wet and greasy road, it collided with a horse trough, then swung into and partially dislodged a tramway standard, and finally ran into the bank so violently that the car was completely wrecked. The driver was thrown clear and escaped injury, but the two passengers sustained serious injuries.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, NOVEMBER 7, 1908.

[No. 505.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

EARLY in the year the R.A.C. discouraged provincial clubs from organising speed contests among their members on public roads, and now, in order to more completely close such trials, the Society of Motor Manufacturers and Traders has decided to ask its members not to participate in such events. This will have the effect of considerably curtailing many club programmes for next season. Those organisations which have among their membership gentlemen who own large estates will have a decided advantage in that respect. But no one is likely to complain of the efforts now at work to prevent a repetition of the contests on public roads—true these have been unattended by accidents, but they have probably caused some of the public to have an erroneous view of the motor-car.

M.P.'s and Motoring.

THE three tailors of Tooley Street, whose attempts to reform the national life did not affect things greatly, have attained a certain prominence in historic annals. We doubt, however, whether such permanent fame is reserved for the three members of Parliament who, in a circular issued to their fellow members of Parliament, have gravely asserted that "The position of motors in relation to public traffic, public rights, and public roads becomes day by day more intolerable." Possessed of such an idea they have therefore convened a meeting of M.P.'s to consider what steps shall be taken to reduce the evil to tolerable limits. We hope those members who motor—Sir Henry Norman, the Hon. Arthur Stanley, Mr. A. du Cros, Mr. Stopford Brooke, to mention but a few—will attend to show Messrs. Harold Cox, Cathcart Wason and Luke White that there is another side to the question which they have presented in such a prejudiced fashion.

Horse-Power and Rating Formulae.

ON Wednesday, at the Institution of Mechanical Engineers, a discussion on Horse Power and Rating Formulae took place, in the presence of a Commission, nominated as follows: one-third by the Royal Automobile Club, one-third by the Institution of Automobile Engineers, and one-third by the Society of Motor Manufacturers and Traders. Mr. T. H. D. Berridge, M.P., who was announced to occupy the chair, was to take the sense of the meeting in settling the questions to be submitted to the Commission for its report.

A Suggestion.

IN connection with the efforts now being made to secure an authoritative system of rating Mr. G. H. Baillie's contribution to the discussion is interesting. As he points out, the data actually do exist; each maker of engines must know the h.p. of his own motors. All that is wanted is to collect this knowledge, and with some assurance that the different makers have measured the h.p. under similar conditions. He then makes this suggestion to the Commission that is dealing

with the subject:—That a small committee independent of all trade influences, such as could be formed from the Technical Committee of the R.A.C., should prescribe conditions for testing the normal maximum h.p. of an engine, and that the different makers should supply the results of their tests on new types or sizes of engines put on the market. The results would have to be treated as confidential by the Committee, otherwise it might be difficult to ensure getting the figures of normal engines. The Committee might then, at the beginning of each year, issue a nominal h.p. formula, based on these results.

Cambridge University Regulations.

THE Proctorial Syndicate at Cambridge have had under consideration certain questions arising in connection with the use by persons *in statu pupillari* of motor-cars and other motor vehicles. It has been represented to them by the proctorial body that well-grounded complaints have been made of reckless and inconsiderate driving by persons *in statu pupillari* in and near Cambridge. The system of county registration has been found inadequate for identification, and the Syndicate propose that no person *in statu pupillari* shall keep, or use, a motor vehicle within the precincts of the University until he shall have obtained permission from some member of the proctorial body. This permission will not be granted until a sufficient description of the vehicle has been deposited with the proctorial body together with evidence that similar permission has been obtained from the college tutor of the student seeking proctorial licence. It has further been brought to the notice of the Syndicate that the word vehicle as used in the prohibitory notices with regard to driving on Sundays may be taken with its various contexts to refer exclusively to horse-drawn vehicles. This was the original meaning of these notices, but the Syndicate think that the time has come for extending their operation.

Teaching Driving in Parks.

THE bye-laws governing the management of the parks, gardens, and open spaces under the control of the London County Council have just been amended so as to include a prohibition of "learning or teaching the driving of any motor vehicle." On another page we give the new wording of the bye-law which deals with the matter; and now draw prominent attention to the point as one of importance to those who have ever taken advantage of the absence of traffic during certain hours in the parks to obtain confidence at the wheel. Apparently only the experienced motorist or those well qualified to drive may now enter the London parks. No novice may drive therein.

The Volturette Record.

ON the Brooklands track, on the 28th ult., M. Naudin accomplished an excellent performance on a Sizaire-Naudin car, fitted with a motor having a 3.934 in. bore, 6-h.p. R.A.C. rating. The day was wet and windy, but, in spite of these disadvantages, M. Naudin—who was accompanied by M. Sizaire—accomplished the half-mile speed test at a rate of 66.48 miles per hour, the fifty miles he covered in 45 min. 54.247 sec., sixty-

five miles 755 yards were accomplished in the hour, and the 100 miles took exactly 1 hour 31 min. 53.452 sec. This constitutes a world's record for a car of the voiturette type, and as such the performance was really remarkable. The conditions under which the car ran were those arranged for the Grand Prix des Voiturettes, and the time of M. Naudin for each lap taken independently gives an idea of the extraordinarily regular running of the car. The fastest lap was the seventeenth, which was covered in 2 min. 30 sec.

London Traffic Board.

THE Deputation from the London County Council which is to meet the Prime Minister, urging him to give precedence to the proposals for a Traffic Board of London, will really follow the lines of the Royal Commission on London locomotion, whose work, though so completely done, has been singularly neglected by the responsible authorities. The main feature of their report was in the recommendation for a Traffic Board, which should not only exercise an advisory function with regard to widening thoroughfares in London itself, but should report on the important main roads leading out of London, Building Laws as affecting districts not yet built over within the area of Greater London, and the general consolidation and amendment of laws affecting traffic.

One of the Aries Petrol Motor Lorries with its novel two-wheel tractor used in the recent military manoeuvres in France.

Orthodox Lines.

DESIGNERS of steam cars have been restricted in their scope of observation as compared with those responsible for petrol cars. The latter have had the experience of many competitors to guide them; those interested in steam car construction have had little direction in that respect. Hitherto attention has been greatly centred on the generation of steam and the economy of the engine, while, now that such matters have had a full measure of study, designers are able to give more heed to the appearance of things, and, as will be evident at the forthcoming show, there will be evidences that steam cars are being built still more closely on the orthodox lines which have been associated with petrol automobiles.

Magistrates and Motorists.

THE recent conviction at the Spittlegate Sessions, Grantham, of Lord Savile's chauffeur, for driving at excessive speed on the Great North Road, has led to correspondence between Lord Savile and Major Longstaffe, chairman of the Bench, who have sanctioned the publication of the letters. Lord Savile complained that the evidence of the Grantham police was not always trustworthy, and said that all sensible and unprejudiced magistrates agreed that the police would be far better employed

in endeavouring to catch murderers and burglars, who now pursued their calling without interruption because the officers were lying behind fences trapping unoffending motorists who might be exceeding the speed-limit by two miles an hour on a clear road. Major Longstaffe, having taken his colleagues into consultation, replied that, as Lord Savile's reflections on the impartiality of the Bench had been made by one who was himself a magistrate of an adjoining county, and repeated by him in the public Press, they could not allow them to pass without formal protest. They were therefore taking steps to bring the whole correspondence to the notice of the Lord Chancellor.

At Cross Roads.

ELSEWHERE we report a legal pronouncement in Scotland which establishes, under the authority of the Supreme Court north of the Tweed, the principle which has been recognised by experienced users of the road as the proper one, but which has hitherto had the confirmation of inferior courts only, viz., that vehicles going on to a main road from a side road are bound to go slow and with special caution, and to have regard to the possibility of there being through going traffic on the main road. The facts of the case which has secured this pronouncement of the Court of Session are given on page 779. In such instances there must be much give and take, with a prior understanding as to the way in which the respective parties are to act. That those entering from side roads should give way to those on the main road, and that both should act in the spirit of courtesy that enables pedestrians to get along on the footpath without physically encountering each other seems reasonable—and may now be regarded as the legal view.

Why Oppose?

THE Haslemere Parish Council have recently come into prominence by reason of their discussions on automobile matters, and at length they have decided to urge the Surrey County Council to make application for a ten miles Speed Limit to be enforced on several roads in the district. The Chairman referred to the difficulty in securing such impositions being made, as the motoring organisations fought every case. We could point out that it is this fact which secures something like equity in the matter, otherwise Parish Councils might be tempted to seek restriction and prohibition without any regard to the convenience of other people but themselves.

Central v. Local Authority.

THE wisdom of not allowing the small rural councils to have administrative sway with regard to motoring matters has just been illustrated in the West Riding of Yorkshire. The Northallerton Urban District Council urged the Highways Committee of the West Riding County Council to petition to the Local Government Board for a ten miles an hour speed limit for motor-cars. The Highways Committee, recognising their responsibility in the matter, went thoroughly into the merits of the application, and found from the report of the Chief Constable that no complaints had been made to the police by the public of the locality nor had it been found necessary to caution any driver for excessive speed, reckless or negligent driving. In fact, from a census which was taken on a recent day, when no fewer than 746 cars passed through the main street, it was found that the average speed was 11.75 miles per hour. Under such circumstances the County Council have rightly declined to accede to the request of a small body whose attitude was apparently dictated by prejudice rather than by a desire to secure equity in the local administration.

ICHABOD—it is past. When the word Ichabod was mentioned in "Motoring Illustrated," in the beginning of this year, the meaning was misunderstood, but now we understand its full significance.

MOTORING ACROSS AUSTRALIA.

FROM ADELAIDE TO PORT DARWIN.

IN a recent issue we recorded the successful completion of a journey across Australia by Messrs. H. H. Dutton and H. M. Aunger on a 25-h.p. Talbot car. The latter gentleman has since visited Melbourne, where he was interviewed by the "Australian Motorist." It is well known that this was Messrs. Dutton and Aunger's second attempt to cross the wilderness, and part of their programme was to pick up the first car where it had been temporarily abandoned. This they successfully accomplished, and took both vehicles through to Port Darwin.

Mr. Aunger, who is of nuggety, Burns-like build, and looks as if the rigours of the trip had only added to the condition of a naturally fine physique, is a motorist by instinct as well as training. He took on the trip as an adventure in that casual way which such men have, and seems not disinclined to do it again. "Mr. Dutton said one day that he would like the trip, if I would go with him," he quietly observed, "and so we went." "We left Adelaide on June 30th, and spent the first night at Mr. Dutton's home, Anlaby, sixty miles from the city. Next day we spun along the main road, and were eventually met by the Burra Automobile Club. The squatters about the district are mostly motorists. They gave us a good time, and we passed on

swallowed us up, petrol, provisions, car and all. Every mile now was won by hard work, but the car behaved marvellously well, and we came by slow stages to the Anna Creek head station, and, continuing on a few miles, ended the detour by again striking the railway.

Without pausing, we pressed on to Oodnadatta, 675 miles from Adelaide. And now a fresh kind of trouble beset us. The country was riddled with washouts. The winter's storm watercourses tear up the sandy soil into holes and gullies which in the dry season remain rigid and most ugly for travelling. We had to simply smash over a long tract of this nature as best we could. At Neil's River came one of our worst experiences to date. We had to dismount and break a causeway through the high banks to effect a crossing. We used the earth broken from the banks to fill up a passage across the watercourse wide enough to let the car pass over, and then we rushed her through, chancing whether the earth would fall away beneath her, or that the car would roll over sideways. Luckily, we got through, and thus, with various adventures every hour, we reached Oodnadatta, after twelve days' run.

Half a mile out from Oodnadatta, which is not yet a palatial city, we struck Alburga Creek, half a mile wide, the bottom rumpled up into lumps of uneven sand. The car simply flung herself from one to another of these in a series of jerky bounds. There was no other way of progressing. Some fair running in

Motoring Across Australia.—Two typical views of the country passed through by Messrs. Dutton and Aunger.

to Petersburg, and still along the main road, without any difficulty, as far as Hawker, 300 miles inland.

From there we commenced rougher experiences, on a bridle track, as far as Hergott Springs. Then the track became worse every mile. There were several ranges of hills and a lot of bamboo saltbush country and the road simply dwindled out of existence. Our next point was Strangway Springs, on the railway. The soil became sandy and broken by several bad watercourses. At Stewart's Creek and the Finnis we found difficulties in crossing, particularly the former, where the banks are 60 ft. high, with a few feet of mud and water in the channel. From the springs we left the line and made a detour to avoid what are known as the Strangway Sandhills. We followed up the banks of the Warrender Creek, and crossed it at its junction with the Anna, keeping as much as possible along the margins of the streams, in order to take advantage of the natural levels of the country. But in this region difficulties are not to be avoided for long. Presently we came across a succession of bad sandhills. We pushed the car and endeavoured to take the rises flying; but in one day we were not able to do more than ten miles. Motoring is strenuous work when you have not only to find your course through a wilderness, but make a road for the car whilst advancing, and even build your own bridges. Crossing the Warrender, we had to make a corduroy track of branches and saplings which we cut out of the scrub, for in the bottom of the creek was a treacherous quicksand, which would otherwise have

the region of Blood's Creek led us on to a labyrinth of boulders and sharp-edged stones, over hundreds of acres of which we rattled frightfully, but the tyres stood the strain marvellously. More trouble of a new type followed on our departure from Charlotte Waters. The country is sandy all the way to Alice Springs, and to vary the monotony there are forty-nine sandhills to be crossed in forty-five miles.

And here we were at last in the centre of Australia, 900 miles from Adelaide, and only half our journey accomplished. And trouble upon trouble, we well knew, was piled up ahead. To begin with, the McDonnell Range is very rough and sandy. At one part we had to get out of the car and roll away many boulders before it was possible to proceed. This laborious progress tried our patience a good deal, but yet another variety of obstacle this forbidding land had to raise against us. This we found on Burke's Plain, where for 80 miles we crunched through the thick, harsh grasses of the desert, which had sprung up everywhere four feet high after the rains. The growth seems almost miraculous. The grass clogged our wheels and got tangled in the engines and gear; but worse was the bother experienced in thousands of anthills hidden in the grass. The larger ones we could see and avoid, but we staggered amongst the smaller ones with a series of bumps which made the teeth rattle. At last the car was brought to a standstill, and we had to chop the anthills down to clear a course for the car."

(To be concluded.)

THE ALLEN-LIVERSIDGE FRONT WHEEL BRAKE SYSTEM.

ON various occasions during the last few years we have referred to the Allen front wheel brake arrangement, the object of which is to overcome the trouble of sideslip or skidding, and at the same time to greatly reduce the wear and tear on the driving mechanism and tyres of cars, doing away with shock during the application of the brakes, and affording double braking power in cases of emergency. The idea has been so far developed that it is now being put on the market by the Allen-Liversidge Front Wheel Brakes, Ltd., of 106, Victoria Street, Westminster, who last week gave a demonstration of the advantages of the system at the garage of the Humber Company in Brook Street, Holborn, E.C.

As will be seen from the accompanying illustration, the brakes are of the ordinary band type, mounted close up against the spokes between the inner side of the wheel and the steering pivot, and are controlled by a pedal on the driver's footboard. The actuating lever which draws the band on the drum on one wheel is coupled to the similar actuating lever on the other by means of a steel cable or other flexible coupling. The latter

View of 15-20-h.p. Humber Car showing the Allen-Liversidge Front Wheel Brakes and Operating Mechanism in Relief.

runs parallel to the line of the axle, and its freedom of movement is obtained by transmitting the braking action through a pulley on which the coupling cable is adapted to run. This can take place irrespective of the pivoting action of the wheels, and is, therefore, not affected by the turning of the road wheels for steering purposes. The flexible coupling, before it is attached to the brake lever, at either end passes round a pulley pivoted to an extension of the steering pivot, and this is also capable of a movement independent of the steering movement. By this means a pull on the brake lever through the pedal actuates each brake simultaneously and evenly, as the automatic adjustment or compensation due to the cable running on the pulleys takes place exactly evenly on both sides, the flexible cable simply sliding over the pulleys and adjusting itself automatically to the altered condition of the wheels, without in any way affecting the action of the brakes, either when the latter are applied or are released. It will be seen, therefore, that braking and steering are absolutely independent movements and do not in any way affect each other. The application of the brake makes no difference to the steering in any way. Another point is that, whatever the angle of the front road wheels, the tension of the cable is not affected.

To demonstrate the efficiency of the new front-wheel brakes, a 15-20-h.p. Coventry Humber fitted with them was driven over a portion of the Humber garage which had been made slippery for the occasion. When the ordinary hand-brake acting on the rear wheels was applied the vehicle skidded round to an alarming degree; on the other hand, when the front wheel brakes were applied a perfectly straight course was maintained until the car came to a stand. A test was also carried out on the road, when the capacity of the new brakes to pull the car up in an extremely short distance was clearly shown, while it may also be mentioned that a slight pressure on the actuating pedal appeared to steady the car where, under ordinary circumstances, sideslipping would have been expected. One great advantage of the system is that it divides the braking power over the four wheels, and thus all are available in case of emergency, whereas in the ordinary arrangement, should anything go wrong with the transmission mechanism, the driver has only one set of brakes to depend on. Not only so, but it is claimed that a greater braking power is afforded by applying it to the front road wheels, thus rendering the usual countershaft brake unnecessary, and that, owing to the increased grip of the road it gives to the latter, steering on greasy corners is facilitated rather than interfered with. It is suggested by the company that when the front-wheel brakes are used, they should be connected up to the usual brake pedal and regarded as the running brake, the rear-wheel brakes being kept in reserve for emergencies.

Altogether the Allen-Liversidge arrangement appears to be a step in the right direction, and on this account is worthy of the attention not only of motorists and manufacturers of motor-cars, but also of the engineers of public service and taxi-cab concerns. So confident are the makers, that they are prepared to fit the front wheel brakes to cars with the condition that before delivery the vehicle so equipped shall be tested on a greased surface equal to the worst conditions of a London street, and if any sideslip be then occasioned by the application of the front-wheel brakes no charge will be made.

THE KEMPSHALL TYRE.

IT will be of interest to motorists generally to know that the Kempshall motor tyre, which has been re-designed, will be presented in a new pattern at the forthcoming Show. The idea has been to retain the full resiliency of the ordinary pneumatic tyre at a considerably reduced air pressure as well as to secure the additional advantage of a non-skid band. We may mention that, in order to demonstrate the merits of the improved form of tyre, a run to Brighton was organised from Northumberland Avenue, London—where the headquarters of the Kempshall Company are located—on Friday of last week. Mr. Schack Somers, the managing director of the Kempshall Tyre Company, was fortunate in securing a fleet of six-cylinder Standard cars on which to carry out this trial, which convinced us that, so far as ease of running and entire absence of skidding are concerned, nothing could have been more effective than the behaviour of the Kempshall tyre. In the new pattern the side walls of the tyre have been stiffened. The ribs from the "suction rings" of the tread now extends to the bead, the effect being to considerably strengthen the whole tyre. Regarded from every point of view the trial was a great success. The party went south and returned from Brighton without a single mishap, the universal feeling being strongly in favour of the Kempshall tyre on all the points that are desirable.

At the opening meeting of the new session of the Institution of Civil Engineers on Tuesday Mr. J. C. Inglis, the president, said it was an interesting speculation how far the steady development of traction by road-motors, both for passenger and goods, would direct outlying sources of traffic into definite channels. Undoubtedly the introduction of road-motors marked a stage in the development of transport in this country.

GOSSIP FROM PARIS.

WILL there be a Paris Salon de l'Automobile in 1909? The question of transforming the great annual show into a biennial exhibition was raised last year, but now the movement in favour of the change has assumed a more definite character than it ever had before. The truth is most of the large manufacturers consider they would sell just as many cars if there was no Salon, and they would like to suppress the heavy expense the show entails on them. I personally know that several of the big firms are willing to undertake not to participate in any automobile exhibition in France in 1909, and I am informed on very good authority that most of those who manufacture at least 100 chassis a year will shortly be asked to sign an engagement to that effect under penalty of the payment of £2,000. In the case of that accord being realised the smaller firms will in their turn be requested to adhere to it. If this campaign succeeds, it is very likely the same means will be adopted to also transform the annual Grand Prix race into a biennial competition, especially if by chance the French happen to carry off the prize next July.

ON Thursday last week the Sporting Committee of the A.C.F. paid an official visit of inspection to the Anjou circuit with a view to its adoption for the Grand Prix of 1909. The following day the Municipal Council of Angers voted a subvention of £1,000 to promote the race. The unanimous support it has found from all the communes through which it passes and the equally unanimous opinion of the Sporting Committee in favour of the circuit leaves no doubt of it being officially adopted. It has, however, one determined opponent. It is a M. Moreau, or someone biding his identity under that name, which is as common in France as Smith is in England. He wrote to M. de Knyff threatening to shoot him if he came in the capacity of President of the Sporting Committee to examine the circuit. M. de Knyff was not, however, killed, though he did drive round the whole of the circuit. The threatening letter, which also contained a most violent and senseless series of invectives against motor-cars and their owners, was handed to the Prefect of the department, who ordered the Public Prosecutor to open a judicial inquiry. On their side, M. de Knyff and his colleagues of the Sporting Committee, who were all condemned to death, have offered a reward of £20 to anyone who may discover M. Moreau or the individual who signed the threatening letter with that name.

HENRY FARMAN has flown from the military camp of Chalons to Rheims, high over the trees, the church steeples, the villages, roads, the railway lines, and the telegraph poles. After accomplishing this feat, unprecedented in the history of man, the English aviator, born in France, announced the fact to his parents in the simple, unpretending words telegraphed from Rheims: "Have flown from Chalons to Rheims without incidents." That depicts the man. He never boasts of what he has done and never

talks of what he intends to try to achieve. I remember how patiently he worked last autumn after he had in October made what may be called his first hops off the ground of a few hundred yards till he had won the Deutsch-Archdeacon prize by flying a kilometre, starting out and returning to his point of departure. Though he had thus demonstrated the possibility not only of flight on a machine heavier than the air, but also that man could direct the machine at will, his head was not turned by all the praise lavished on him. He made no long speeches at the banquets given in his honour, and was, indeed, with his retiring nature, incapable of doing so. Henry Farman is a man of "deeds, not words." His silent determination to vanquish showed itself publicly at eighteen years of age, when he entered the lists against so many champion cyclists in the Paris-Clermont-Ferrand race, which he won with an advance of twenty minutes on his nearest rival. A couple of years later he carried off the cycling championship of France for 100 kilometres, and subsequently, when the automobile races were instituted,

won with his now proverbial modesty several of the most coveted prizes, and among them the trophy awarded for the first of the heavy cars in the Paris-Vienna race.

DURING that period of his life he was at the same time studying art in the studio of the great French artist Courtois with as much silent determination to succeed as he showed in sport. But with his true British common sense he at length recognised that in art he could never hope to excel all others, and he wished to be at the top of the tree, in fact a leader. Practising his art of painting as a pastime and working with his brother Dick in the automobile business, he was constantly on the watch for something new in which he could lead the way. He was not very long in finding it in aviation, which he studied all the more passionately because he was conscious it would operate a yet greater revolution than that already effected by the motor-car, and because the conquest of the air would realise perhaps the most deeply seated ambition of the human race. Henry Farman is by his English blood and his French home

the incarnation of the Entente Cordiale. He loves France as his native land and England as his mother country. Though he has as yet never spoken of attempting it, he may one day in a near future seek to link the two countries yet closer together by creating an aerial road between them by flying across the Channel.

MARNEY.

THE Lansdowne Motor Garage is located at the corner of Belvedere Road, Upper Norwood. It has motor landaulets for hire and is finding useful employment in connection with theatre parties and the like.

"PLEASE remember that your acetylene lights are a nuisance to everybody else but yourself, and don't use them in city streets or where not absolutely necessary." Such is the advice which is being given on printed cards to members by the Rhode Island Automobile Club.

Trackless Traffic; or the Trolley Aeroplane.
Fresh Air! No Dust! No Smells! No Police Traps—as yet!
By permission of ["The Electrical Times."]

CONTINENTAL NOTES.

The Prince Henry of Prussia Touring Car Competition.

As briefly announced in our last issue, the 1909 Prince Henry of Prussia touring car competition is to be held from June 10th to 18th. Starting from Berlin, the daily runs will be to Breslau, Tatra Lomnicz, Budapest, Vienna, Salzburg, and Munich. There will be a day's rest at both Budapest and Vienna, while the prizes will be distributed at a banquet held at Munich on June 18th.

A Lorraine-Dietrich Two-cylinder Car.

Following the tendency amongst the leading French motor manufacturers to build cars of smaller horse-power than hitherto comes the news that the Lorraine-Dietrich Company are introducing for the coming season a 10-h.p. two-cylinder live-axle car. The engine, which has a bore of 80 mm. by 120 mm. stroke, will be fitted with a high-tension magneto, thermo-syphon water circulation, and three speeds, with direct drive on the top.

Motor Races in Belgium.

It will be remembered that this year the Ardennes races had to be abandoned owing to the dates clashing with the

Touring in Italy.—A Snapshot on the road to Naples.

events organised in Italy. Apparently the Belgian Automobile Club does not mean to be out of the running next year, for it has already decided to hold the Coupe de Liedekerke contest and a race for light cars on the Ardennes circuit at the end of August next. There is also some talk of organising a race for six-cylinder vehicles, and for machines having four-cylinder engines of a maximum bore of 90 mm.

Aeronautical News.

The past week is one which will mark an epoch in the history of aviation. Principal interest centres round the performances of Henry Farman, who scored a fresh success with his aeroplane on Friday, the 30th ult., when he succeeded in making the journey from Châlons to Rheims in twenty minutes and without coming to earth. This is the longest straight flight that has yet been accomplished with a heavier-than-air machine, the distance as the crow flies being about seventeen miles. Farman brought his week's exploits to an end on Saturday by winning the French Aero Club's prize of £100 for the first officially observed ascent to a height of 25 metres (82 ft.). The course was marked out by a series of captive balloons and a long pole set on a tower. Farman found no difficulty in executing his task; his aeroplane

on leaving the ground rose at once to a height of about 100 ft., or some 20ft. more than required to win the prize, and after circling twice above the captive balloons he descended without mishap.

—Wilbur Wright gave a first lesson in aeroplaning to Comte de Lambert on Wednesday last week. Three flights were made, Mr. Wright working the levers controlling the raising and lowering of the wings and connecting with the rear rudder, while Comte de Lambert handled the lever commanding the front rudder. Following a slight accident on the 30th ult., Wright attached a new motor to his machine, and on Saturday, at Anvours carried out a series of flights in the presence of the French Army Commission, and subsequently took a passenger for a ten minutes' trip in the air. —On the 30th ult. Blériot made another attempt at Chartres to win the prize offered by the French Aero Club for the greatest height reached in an aeroplane. After a flight of fifteen seconds the motor suddenly stopped, and the machine came down, the shock of the fall seriously damaging the framework and warping the propellers. This is the fifth or sixth time that M. Blériot has had an accident in mid-air, but he has so far always escaped any serious injury. His greatest success to date was achieved on Saturday, when, after a brief trial, he swept away from his practice ground and was quickly lost to sight. Motor troubles caused him to descend twice, but he flew in all from Chartres to Toury and back, a distance of 16½ miles. He passed directly over three villages, and covered one stretch of 8½ miles in eleven minutes. —The Paris Municipal Council has allocated the sum of £600 to the Ligue Nationale Aérienne for the encouragement of aviation. The League has also received two more prizes of £400 each —one for the first aeroplanist who flies 100 kilometres without stopping, in less than two hours; the other for the first flight from Châlons to Issy, near Paris, a distance of 112 miles. —The new dirigible balloon, the Clément-Bayard, with four passengers on board, made a successful initial trial trip on Thursday last week over Paris from its shed at Sartrouville, in the suburbs. The balloon, which is fitted with an engine of 120-h.p., resembles in general lines the Ville de Paris and the Patrie; it is 60 metres long, and 10½ metres in diameter. —Herr Meschler, a well-known German engineer, has constructed, at Tempelhof, near Berlin, an aeroplane that follows very closely the lines of the Wright machine. The preliminary trials are reported to have given great satisfaction. —Baron de Caters, the well-known Belgian motorist, made a trial with his aeroplane a few days ago. The "Albatross," as it is called, in the course of its flight rose to a height of about 6 ft. and flew nearly a mile. —The Italian military airship accomplished a notable feat on Saturday last, going from its shed at Vigna di Valle, near Bracciano, to Rome and back.

Speed Trials in Russia.

A series of flying kilometre speed trials was held at Moscow a few days ago; the best time recorded was that of M. Prochoroff on a Fiat, who covered the distance in 39 sec., equal to a speed of about 61 miles per hour.

A New Aeroplane Engine.

One of the new Renault air-cooled engines for aeroplane purposes was last week subjected to an official test before the officials of the French Automobile Club. The motor, which weighs complete about 3 cwt., ran for three hours without a stop, and at 900 revolutions per minute developed 58-h.p.

Miscellaneous Items.

The Criminal Investigation Department of the Berlin police force has lately acquired a motor-car for the use of detectives engaged more especially in important murder cases and burglaries. —The leading importers of foreign motor-cars in Brussels have lately resolved to only supply spare parts for, or carry out any repairs to, such vehicles as are purchased through the official agents in the country. The cars of tourists are of course excepted. —The German Imperial Automobile Club proposes to hold a Reliability Trial of light cars in July next year. —A service of motor taxi-cabs has just been started in Turin. —An automobile club has lately been formed at Pilsen, Austria.

THE SOCIAL WHIRL.

THE King has been staying at Moulton Paddocks with Sir Ernest Cassel, and taking motor-car drives in the vicinity. On Tuesday afternoon the Queen went out for a motor drive with Princess Victoria from Buckingham Palace.

THE Prince and Princess of Wales went on Wednesday to Wynyard Park, Stockton, as the guests of the Marquis and Marchioness of Londonderry, and will remain there till the 7th inst. The programme includes pheasant shooting for the Prince and motor-car excursions for the Princess, on Thursday and Friday to Lumley Castle, near Chester-le-Street, and into Durham respectively.

THE third annual dinner of the Automobile Co-operative Association was a very pleasant gathering, over which the Earl of Onslow presided, and amongst those who were present were Viscount Massereene and Ferrard, Lord Leigh, Sir Wroth Lethbridge, Lady Berwick, Sir O'Bryen Hoare, Mr. Solomon J. Solomon, R.A., and Mr. Staveley Hill, M.P. The latter proposed the toast of the evening, and congratulated them on having recently secured the hon. member for Orkney and Shetland, who had not always been regarded as a friend of motorists.

I REGRET to hear that the recovery of Lord Curzon, after his recent motor-car accident, is proving a more tedious matter than was originally anticipated. The shock was really more serious than was announced at the time, and a sea cruise is now in serious contemplation by his lordship.

MR. J. T. SEWELL, who, as president for the year of the Press Club, took the chair at the annual dinner on Saturday, when the Earl of Crewe was the principal speaker, is also one of the best-known members of the Motor Cycling Club.

THE activity of the Aero Club has caused many people to forget that the oldest society in this country devoted to aeronautics is the Aeronautical Society of Great Britain, which was founded in 1866. It is, according to Col. J. D. Fullerton, R.E. (retired), the hon. secretary, the oldest society of the kind in the world, and numbers among its members nearly all the principal scientific workers on this subject. Lord Rayleigh, President R.S., Sir W. Crookes, F.R.S., Mr. Davies, F.R.S., Sir Hiram Maxim, Dr. Shaw, F.R.S., Colonel Templer Major Baden-Powell, and Colonel Capper, R.E., are members of the council, and the negotiations for the acquisition of a large experimental ground for the use of members are now practically complete.

THE Hon. Eustace Dawnay has given consent to the erection of a notice board at West Heslerton, on the York and Scarborough road, indicating that the Motor Union had contributed towards the cost of the road improvement at that place.

THE mobilisation scheme for the Lincolnshire A.C. is being considered by the North Yorkshire A.C. and other motoring organisations. A large number of motorists in the Fen county have already asked Dr. Godfrey Lowe, of Lincoln, to place their names on the register.

MR. DE RODAKOWSKI, who has acted as clerk of the Brooklands course during the racing season, has, to the regret of the committee, resigned that office. He will remain a member of all the committees of the club.

LOLLIUS.

AMONG the cars sold during the last week by the Motor Supply Company, Limited, of Piccadilly, W., are a 14-20-h.p. Renault landaulet to Mr. Stanley Whitfield, of East Grinstead, a 40-h.p. Deasy to Captain Vandebyl, and a 14-20-h.p. Siddeley to the Rev. Howard Hall, of Hull.

HERE AND THERE.

IN the High Street, Sutton, Messrs. Davis and Co. have just opened a well-arranged garage.

DR. ROBERTS, of Dublin, has lately acquired a Darracq car through the Dublin Motor Company.

WE learn that the Austin Motor Company have decided to build a team of cars for next year's A.C.F. Grand Prix race.

MESSRS. C. J. RICHARDS AND CO., motor engineers, Pontypridd, have lately put a Star 12-h.p. taxi-cab in service in that town.

THE municipal authorities of Wellington, New Zealand, are at present considering the question of increasing the number of their motor fire-engines.

THE County Councils Association have decided to convene a conference early next year to consider the conclusions of the recent International Road Congress held in Paris.

AT the foot of Star Hill, Rochester, the City Motor and Engineering Company have opened a garage where motor-cars will be stored, cleaned, and repaired by contract if desired by local motorists.

THE magistrates of Inverness are urging the Town Council to apply to the Secretary for Scotland to make a regulation restricting the speed of motor-cars within the burgh boundary to ten miles per hour.

MESSRS. MCCURD'S, LTD., the well-known dealers in second-hand cars, of 81, Euston Road, London, are about to open a large depot at Store Street, Tottenham Court Road, W.C. The premises are not only extensive, but are being splendidly equipped and are most centrally situated.

TO their series of Guides to historic towns Messrs. Methuen and Co. have just added Wells and Glastonbury—a volume full of interest and dealing with a wonderful abbey and town. Mr. T. S. Holmes is the author, and to those motorists who delight in antiquarian expeditions the volume will prove delightful reading.

A CAIRO correspondent reports that the number of cars in Egypt this season has shown a considerable increase over last year. In Cairo 264 motor vehicles have been registered, as against seventy-five, and one or two new garages have been opened. In Alexandria there are thirty-seven cars owned locally and registered.

THE members of the Scottish Agricultural Commission have just returned after a trip of inspection through Canada. At one agricultural town visited by them they found twenty motor-cars, which were provided by local farmers for their service. It was stated that at least a dozen of these were owned by men who had worked as farm labourers in the Dominion within the last fifteen years.

THE Chelmsford Town Council have received a letter from the Home Office with reference to the appeal of Mr. Austin, of the County Motor Works at Chelmsford, against the restrictions which the Council proposed with reference to the storage of petrol. The Home Secretary thought that if the store was fenced it would not be necessary to erect an unclimbable fence at the entrance to the yard, and he could not see that it was less dangerous to store 550 gallons than it was to store 1,000 gallons. Before he came to a decision upon the appeal, he wished to know whether the Council would modify their restrictions. The matter was referred to the Sanitary Committee.

MESSRS. HICKEN AND KIDSTON, of 106, St. Paul's Road, Southsea, have sent us particulars of a little device they have designed and protected, in the shape of an automatic tell-tale for the rear lights of motor-cars, railway trains, or any light out of ordinary sight, by means of which the driver is given a warning when his rear light has gone out by means of an electric lamp, which may be fitted on the dashboard, becoming suddenly ignited. The device is intended to be used in connection with any existing rear lamp, paraffin or acetylene, and is arranged to be used in connection with a 4-volt accumulator, preferably one of the spares generally carried by motorists. No current is, however, used, should the rear light become extinguished, except for the few minutes that elapse while the driver relights the lamp.

MR. H. H. CARTER, who has had considerable experience in connection with public service vehicles, has started a motor repair depot at Gloucester Green, Oxford.

THE latest contribution to the news about the Knight "silent" and "valveless" engine is that Mr. Harvey Du Cros has secured British selling rights therein for Panhard-Levassor.

MR. A. WHALEY has a compact and well-equipped garage in the Bridge Street, Forres, and has done well during the past season in attending to the requirements of motorists passing through that popular Highland town.

MR. HENRY FARMAN'S aeroplane voyage from Chalons-sur-Marne to Rheims, on the 30th ult., which constitutes such an important step in the history of aviation, is to be recorded by two monuments. The spot from which he started and the place where he landed are to be marked either by a statue or an obelisk.

MESSRS. W. SEARLE AND CO., who are responsible for the O.S. first prize speedometer, announce the publication of a brochure dealing with speed and mileage recording instruments. Owners of cars who are interested in methods of ascertaining car cost, checking up-keep expenditure, as well as knowing their car's speed, are invited to write for a copy of Edition M. of this pamphlet, which will be sent on application to the firm at 33, Glasshouse Street, London, W.

A Bavarian Government Public Car Service.—A Snapshot between Bershtesgaden and Hintersee.

WHEN the list closed on the 31st ult. twenty-seven entries had been received for the American Automobile Club's Grand Prix race, which is to be held in Savannah on the 26th inst. The American competitors are fourteen in number, and comprise an Acme, three Garfords, a Stearns, a Thomas, two Lozier, a Pennsylvania, two Chadwicks, a Matheson, a B.L.M., and an American Berliet. Europe will be represented by three Fiats, three Benz, two Mercedes, a Lorraine-Dietrich, two Bayard-Clements and two Renaults. The three Benz cars for the contest are the same as took part in the A.C.F. Grand Prix in July last; they have, however, been fitted with new engines, the cylinder dimensions of which are stated to be 150 mm. bore by 200 mm. stroke.

THE United Motor Industries, Ltd., whose headquarters are at 45 and 46, Poland Street, London, W., have issued their new catalogue for 1909. Amongst the specialities illustrated and described therein are the new "Castle" accumulator plates made at the firm's Eagle Works at Holloway. These have effectually overcome the risk of buckling, and the accumulator in which they are fitted has a new incorrodible terminal. The Eisenmann magneto, the "Castle" single trembler condenser coils, the L.M. de Luxe plugs, new "Castle" switches, Castle-Jupiter lamps, Simplex speedometer, new radiators, &c., are all referred to in this extensive list, the new style of numbering the pages of which will facilitate easy reference.

THE police authorities in the Dunfermline district have taken action against several vanmen and carters who have not been conforming to the Light on Vehicles Bill.

SPEAKING at Leeds, Mr. Philip Snowden, M.P., declared, a few days ago, that the Government must face a scheme of new roads for motor-cars to be a link between the railways and the land. Such a plan would involve an expenditure of ten or twenty millions sterling.

AN advance of 5d. per gallon in the price of industrial alcohol has been announced by the methylators, and manufacturer's spirit is now 4d. per gallon dearer than it was before the enforcement of the Revenue Act, 1906, by which a rebate of 5d. per gallon was granted on specially denatured spirit for industrial uses. The increase in the cost of raw material, the close agreement existing between methylators, and the absence of German competition have contributed to the advance, the latter two being, according to the "Manchester Guardian," the predominating causes.

THE Tyre and Accessory Section of the Society of Motor Manufacturers and Traders, having had its attention called to a custom said to be more or less prevalent in the accessory trade of marking ignition storage batteries with a fictitious capacity, recommend (1) that accumulators shall have printed on their labels their actual capacity when discharged at a definite rate continuously, this rate being one-twentieth of the capacity claimed. An interval of rest to be allowed, such interval not to take place until half the period of discharge has expired. (2) The accumulators can have printed on their labels the approximate capacity with intermittent current, which shall be arrived at by doubling the actual capacity obtained by following rule 1.

THERE is evidence that there will be a demand next season for cars of a relatively low horse-power, and, anticipating this, the Mors Company have produced an interesting 10-15-h.p. four-cylinder model, the engine of which, under R.A.C. rating, gives 15.9-h.p. The new vehicle comprises all the characteristics of the Mors design and construction, and is practically a big car in miniature. It is of the live-axle type, with direct drive on the top gear, fitted with magneto ignition, metal-to-metal clutch, and the length of chassis is such as to allow of a roomy, comfortable, side entrance carriage body of the closed or open type being fitted. We learn that Mors (England), Ltd., have succeeded in purchasing the whole of the output of this particular model, with the result that they alone are entitled to sell the same. Since the arrangement was concluded they have received applications from French agents for batches of the cars; but the company are endeavouring to retain as many as possible for the English business. Mors (England), Ltd., will be able to start deliveries almost immediately, and are ready to arrange for exclusive agencies for the new 15-20-h.p. car in any part of the world.

As briefly mentioned in our last issue, a demonstration was given on Thursday, last week, at the garage of the Wolseley Company at Westminster, S.W., of a new motor spirit known as "N.U." It is claimed that the fuel, which is being introduced by a syndicate styling itself N.U. Motor Spirit, not only gives a perfect combustion with a consequent economy in the cost of running, owing to the greater mileage per gallon, but also dispels all noxious fumes from the exhaust, and that even when the engine is over-lubricated no annoying smell or smoke is emitted. In proof of this two Siddeley cars, which were lent by the Wolseley Company for the occasion, were driven round the garage for some time, while in the yard outside a vehicle was run, the engine of which had been purposely over-lubricated. So far as the demonstration went, it certainly appeared to uphold the claims made for it, the outlet pipe of the silencer, in place of the usual obnoxious fumes, emitting an invisible puff of warm, agreeable air. No information was, however, given to those who attended the demonstration as to the composition of the new spirit, or the treatment it is subjected to in order to give to it the useful properties it possesses; all we could learn was that it has a specific gravity of from .715 to .720, that it necessitates no change in the adjustment of existing carburettors, and that its price will be the same as ordinary motor spirit.

MOTOR-CARS OF THE FUTURE.

FOLLOWING the suggestions made by agents in our last issue with regard to the points of improvement on cars which would be appreciated by motorists, and also the tendencies noted, so far as the demand for automobiles is concerned, the letters below will have interest for all our readers:—

THE MIDLANDS.

The principal demand in Leicestershire, according to Messrs. G. H. Wait and Company, is for cars from 8-h.p. to 16-h.p. and the prices from £200 to £350.

With regard to the matters for improvement, undoubtedly one of the great points is the clearance of underworks and shape of wings to reduce the dust raising to a minimum. Another important point for the designers to study is the question of keeping the weight backwards as much as possible, so as to prevent the rear part of the car skidding round to the front, and the third point is the question of accessibility of parts.

Other correspondents in Birmingham, Worcester, and Hereford suggest that the demand in the immediate future will be for cars of 10–12-h.p. up to 15-h.p.

SOUTH WALES.

Mr. Parker Thomas, of the South Wales Motor Company, believes that the type of car which will be popular is that of about 12–14-h.p., four-cylinder, fitted with either two or five seated bodies.

Special points that manufacturers should study are, in his opinion, in the details, both as regards the body and the chassis. The convenience of filling the petrol tank, lubricating oil tank, and getting the working parts covered in, &c., seem to be appreciated by the buying public to-day.

DEVONSHIRE.

There is not the slightest doubt, writes Mr. Ernest Gould, the managing director of Messrs. Gould Bros., of Exeter, but that there is a growing demand for cars of a medium horse-power, and cars of from 15-h.p. to 20-h.p. are not in such demand as hitherto.

Personally we think there is an opening for a light car with a four-cylinder engine of about 8-h.p. to 10-h.p., as we get several enquiries for such a vehicle from gentlemen in the medical profession, and we believe, also, there are a number of local traders who would go in for such a car. From the fact that none of the makers cater for this class of buyer they have no alternative but to purchase second-hand cars in order to get a four-seated car of moderate power, and even in many cases these cars are much too powerful for this class of motorist, as the cost of petrol consumption and tyres is more than they can afford to keep up. With regard to the design of such a light car as we mention, this should be fitted with a light side-entrance body, and, if possible, with detachable tonneau, so that the car might be used as a two or four seater. There is still a good sale for cars, and we feel certain, in the event of one being produced to meet the requirements as we have before mentioned, there would be a large number of such cars sold, especially in this district, where we have a large number of customers of moderate means to cater for.

Mr. T. R. Davis, the managing director of the Plymouth Automobile Engineering Company, Ltd., finds that the people who are entertaining the idea of purchasing cars show a decided favour for the cars of small horse-power, such as 12–14 and 14–16-h.p. Those who ask for vehicles above 20-h.p. are very few in number.

He would like to see makers go further in the direction of simplicity of control, and also fit their cars with tyres of a larger size than is usually the case.

BRISTOL.

There is no particular horse-power upon which the public seems to have set its mind, report Messrs. Perry and Turner, Ltd., of Bristol, but there is undoubtedly a very strong tendency to leave the high-powered cars alone. They find cars selling quite freely in the district up to 20-h.p., but above that power few sales have been made in the past six months.

While they have received scores of minor suggestions in the course of their trading, they invariably find that whenever they bring these before high-class manufacturers they have already been anticipated, and at the moment they have no serious suggestion which they could put forward. Messrs. Perry and Turner, Ltd., have made it their practice to sell nothing but the very highest class of car, and the success of such vehicles to-day makes it very difficult to find fault. Most certainly they do not think that high-class motors have reached the stage of perfection, but the consistent good running of the cars as sold by them has been remarkable, and, were it not for some of the cheaper goods finding a market, their repair department would be in a very sad plight. Personally they note a strong growing tendency for the public and manufacturers to encourage small cars.

SOUTH COAST.

"Generally speaking," writes Mr. F. Constable, of the Brighton and Sussex Motor Works, "large cars of high power, landaulets and limousines, have been in demand, although in this town of Brighton almost all makes of cars of all powers are represented."

Almost every intending purchaser has his own view, or is equally influenced by the opinions of his friends, who may or

One of the Electric Motor-Buses in Service at Ahrweiler, Germany. As will be seen, the vehicle takes the necessary current from an overhead conductor in the same way as electric tramways. It is proposed to introduce the system in this country at Dundee and Manchester.

may not have cars, as to what improvements are desirable in these vehicles. Generally, the car most likely to be in demand is one with a good margin of power, so as to avoid frequent gear changing, reasonable passenger capacity, moderate weight and inexpensive upkeep."

Messrs. Hill and Boll, of Yeovil, consider a 15-h.p. about the most suitable for general use for their district, distinguished by compactness, with a wheel base that is not too long, on account of country lanes.

From Southsea Messrs. S. Rose and Co. write that the type of car which seems in demand in Hampshire is a four-cylinder ranging from 12-h.p. to 18-h.p., the price not exceeding £400. There seems a tendency to have bodies convertible to two seaters.

THE garage of the Royal Express Motor Works, Richmond Road, East Twickenham, has accommodation for fifty vehicles and a special plant for the overhauling and repair of cars of all types.

THE Aeroplane Trial Grounds which M. Delagrangé is establishing at Savigny-sur-Orge, France, is approaching completion, and it is expected that some trial flights will take place in a few days.

New Cars for the 1909 Season.

SOME NEW MODELS TO BE SHOWN AT OLYMPIA.

THE annual motor-car exhibition at Olympia opens on Friday, the 13th inst., and will continue until the 21st inst. While many manufacturers are restricting the alterations in their 1909 models to matters of detail, there will be quite a number of new vehicles on view, including several specially designed for motorists of moderate means. It may therefore safely be said that the interest of the forthcoming show will be well up to that of its predecessors. For one thing the new "valveless" engine of the Daimler Company will make its first public appearance, and in addition there will be several other motors of new design—notably one working on the two-cycle system, which will well repay careful scrutiny. Below we commence our review of the principal exhibits.

The Mors Cars.

The *piece de resistance* of the exhibit of MORS (ENGLAND), LTD., will be the new 10-15-h.p. four-cylinder car (Fig. 1), not the least prominent

public, and to call the car by the name of its designer, Mr. E. J. Y. Rutherford. It will therefore in future be known as the Rutherford. The 30-40-h.p. type remains the standard for 1909, but has been considerably improved and simplified. The chassis is built on similar lines to that of an up-to-date live axle petrol car, the difference being that in place of a petrol motor a "flash" generator is fixed beneath the bonnet and that there is no change-speed gear. The flash generator, which consists of a series of spiral tubes heated by a paraffin burner, is located immediately to the rear of the condenser. The burner is adapted to use ordinary paraffin oil as fuel, and a distance of about twelve miles per gallon can be covered. Behind the generator is a heavily-lagged division plate, which prevents any heat from the generator passing along the chassis. The three-cylinder engine is partly under the bonnet and partly under the footboards, as in last year's models. It is of the single-acting vertical type, the cylinders being $3\frac{1}{2}$ in. bore by $4\frac{1}{4}$ in. stroke, fitted with cam-operated mushroom valves. The friction clutch has been dispensed with, so that a positive

Fig. 1.—Chassis of New Mors 10-15-h.p. Car.

feature of which is the relatively low price at which it is being offered. The engine has the four cylinders, 80 mm. bore by 90 mm. stroke, cast in one piece, with the valves all on one side. The carburettor is of the automatic type, and has two jets; when the engine is running light only the smaller of the two is working, but as the throttle opens the larger one comes into action, the other being cut off by a cone valve. The lubrication is controlled by exhaust pressure, an auxiliary hand pump being also fitted. The ignition is by high-tension magneto. The clutch is of the metal-to-metal contracting type. The gear-box gives three speeds, the final transmission being by cardan-shaft to a live axle; on the top speed the drive is direct. The pressed steel frame is suspended forward on semi-elliptical and at the rear on three-quarter elliptical springs. The chassis is of sufficient length to take a side entrance body of roomy dimensions. Other Mors live-axle cars to be exhibited include a 15-h.p. and a 20-h.p. The remaining models will be chain driven, and will comprise a 30-h.p. and a 45-h.p. four-cylinder, and a 50-h.p. six-cylinder. The limited output of the latter has been chiefly absorbed in England this year, and the great satisfaction the vehicles have given to their users has induced the company to decide to push this type very actively during the coming year.

The Rutherford Steam Car.

Since last year it has been decided by the HIGHCLERE MOTOR CAR SYNDICATE, LTD., Highclere, Newbury, to discontinue the initial letters under which the E.J.Y.R. steam car was introduced to the

drive is transmitted direct through the cardan shaft and bevel gear to the live axle. It is, however, possible to run the engine free for warming up. The automatic control has been very considerably improved, and now enables a constant head of steam at a uniform pressure and temperature to be always maintained in the generator without any action on the part of the driver. The water tank holds enough water for 100 miles, and, as the consumption of paraffin is about eighteen miles to the gallon, these cars should compare very favourably with petrol cars as regards upkeep and running cost.

The Adler Cars.

The great success of the Adler 9-h.p. car, which won the silver cup in its class in the 2,000 miles trial, has induced Messrs. MORGAN AND CO., LTD., London, to place on the market for the coming season a new model with a 12-h.p. four-cylinder engine. The construction is essentially similar to the 9-h.p. chassis, with two-cylinder vertical engine, which has given excellent results, not only in trials, but in ordinary practical use. An outstanding feature of the new vehicle is the accessibility of all its parts, they being so arranged that they can be readily and rapidly taken to pieces and reassembled. In addition to the above, a specially-constructed chassis of similar engine power, but shorter wheelbase, fitted with specially-designed two-seated "Morgan" body, capable of a speed of fifty miles per hour, is being introduced, also a 7-h.p. (R.A.C. rating) chassis with two-cylinder vertical engine, bore 75 mm., stroke 100 mm., with magneto ignition. The vehicle can be fitted with either a two or four seated body.

The Charron Cars.

A full display of Charron cars will be made by the LONDON MOTOR GARAGE COMPANY, LTD., the sole agents in England. Hitherto only vehicles of relatively high power have been turned out, but to meet the demand for popular-priced cars two new models are being shown at Olympia for the first time. These are the 8-10-h.p. two-cylinder (Fig. 2) and 16-h.p. four-cylinder. The chassis are identical in every respect except as to the number of cylinders and that the 16-h.p. has all four cylinders in one casting. The bore and stroke in

Fig. 2.—Chassis of Charron 8-10-h.p. Two-Cylinder Car.

both cases is 80 mm. by 120 mm. While following the general lines of the Charron cars, a notable feature of the new models is the placing of the radiator at the rear of the bonnet and in front of the dashboard, similarly to the Renault vehicles. Ignition is by high-tension magneto, and the lubrication by a pump located in the base chamber and operated off the rear end of the single cam shaft. The transmission is through a cone clutch, three-speed gear-box to a live axle. The following cars and chassis will comprise the exhibit:—An 8-10-h.p. two-cylinder single landaulet, adapted for use in towns and suitable for the work of professional men; a 16-h.p. chassis; a 22-h.p. double landaulet with carriage work by Hooper; a 30-h.p. limousine landaulet, with Hooper body; and a 30-h.p. limousine, painted grey, with dark red under-carriage.

The Motobloc Cars.

Hitherto the Motobloc cars have been of relatively high power. For the coming season quite a new class of motorist is being catered

Figs. 3 and 4.—Elevation and Plan of Motobloc 9-11-h.p. Single-Cylinder Car.

for by the production of a 9-11-h.p. single-cylinder car, designed to be fitted with either a two or four-seated body. A plan and elevation of the chassis is given in Figs. 3 and 4, while a photograph of the motor is reproduced in Fig. 5. The frame is of the usually pressed steel construction. The engine, which has a bore of 100 mm. by 120 mm. stroke, has the mechanically-operated inlet and exhaust valve arranged behind the radiator. The throttle of the automatic carburettor is

controlled both by hand and foot levers. The ignition is by a gear-driven high-tension magneto. A simple but effective device to ease the compression enables the motor to be easily started; the arrangement is actuated by a lever concealed in the side member of the frame near the radiator. The latter, which is so supported in the frame that it is protected from road shocks, is of the honeycomb type; the water pipes, through which the circulation is maintained by a novel form of pump, are kept as short as possible. As is usual in the Motobloc design, the engine base chamber and gear-box are bolted together to form a single unit. The clutch is of the metal-to-metal type, somewhat on the lines of an internal expanding brake; it is arranged to run in oil. From the three-speed gear-box the power is transmitted by a cardan shaft and bevel gear to a live axle of strong design. The BRITISH MOTOBLOC SYNDICATE, LTD., the British agents, in addition to the single-cylinder car described above, will also display an 18-22-h.p. chassis, a 25-h.p. chassis, and a 35-h.p. landaulet. These are all fitted with four-cylinder engines, a noticeable feature of which is that the flywheel is enclosed in the crank case between the two pairs of cylinders.

The Unic Cars.

Messrs. MANN AND OVERTON'S have for some time past been devoting special attention to the demand for landaulets for town and station use at a moderate price, and vehicles of this class will form a

Fig. 5.—View of Engine of Motobloc 9-11-h.p. Car.

special feature of their exhibit at the forthcoming show. A prominent place will be given to the Unic 10-12-h.p. two-cylinder car. This has already been described in the *M.C.J.*, so it will suffice to mention that the engine comprises two cylinders 102 mm. bore by 110 mm. stroke, and that the transmission is through a leather clutch, a ball-bearing gear-box giving three speeds and a reverse, and a direct drive on the top through a cardan shaft and bevel gear to the rear live axle. The chassis is of the same type as that employed in the large number of Unic cabs now running in London. Other cars on view will be a Unic 12-14-h.p. with side-entrance body and a Unic 16-20-h.p. chassis. Of the Brasier productions, the display will include a 30-40-h.p. touring car and one of the new 10-12-h.p. two-cylinder landaulets. The engine of the latter, which is 90 mm. bore by 120 mm. stroke, is provided with thermo-syphon water circulation; a leather cone clutch is employed, while the three-speed gear-box gives a direct drive on the top speed.

The Motor Supply Company.

THE MOTOR SUPPLY COMPANY, LTD., of Piccadilly, W., will exhibit on Stand No. 120, in the Annexe, some fine specimens of cars of moderate power, namely, a 14-20-h.p. Renault with a splendid example of Brainsby's best carriage work in the form of a three-quarter landaulet body, seating four inside, with extension over driver's seat. They will also have an 18-24-h.p. Austin double landaulet with coachwork by McNaught. This makes a beautiful and most comfortable carriage, and will easily accommodate five persons inside. In addition a Zedel 10-12-h.p. two-seated car will also be on view, the vehicle being suitable for a doctor or professional man.

The Star Cars.

The exhibit of the STAR ENGINEERING COMPANY will consist of three live-axle models of respectively 10-h.p., 12-h.p., and 15-h.p. The first-named should appeal to a large class of buyers, for it is up-to-date in every respect, as may be judged from the brief specification appended. The engine comprises two cylinders 4 in. by $4\frac{1}{2}$ in., the ignition being by Bosch high-tension magneto. The change-speed gear is gate-controlled, giving three speeds with direct drive on top. The

Fig. 6.—The Star 12-h.p. Live Axle Car.

vehicle is designed to be fitted with a four-seated side-entrance body. Fig. 6 depicts the Star 12-h.p. car, which is one of the company's most popular productions. The engine comprises four cylinders, $3\frac{1}{4}$ in. by $4\frac{1}{2}$ in. stroke, the other details being the same as the 10-h.p. An entirely new model, of which a polished chassis will be shown, is the 15-h.p. four-cylinder car (bore $3\frac{1}{2}$ in. by $4\frac{1}{2}$ in. stroke). This vehicle will be fitted with two systems of high-tension ignition, while another feature is that the gear-box gives four forward speeds, the direct drive being on the third and not on the top gear. The excellent reputation enjoyed by the Star cars should be well maintained by the 1909 models.

The Ariel Cars.

A prominent place will be given on the stand of ARIEL MOTORS, LTD., to a new 20-h.p. car which has been introduced to meet the demand for a medium-powered vehicle of high-grade construction and moderate price. The engine, which comprises four cylinders, 100 mm. by 115 mm. stroke, has the valves arranged on opposite sides. The ignition is by high-tension magneto, while the lubrication will be by a pump driven off the motor, and located in the crank case. The transmission is through a "gate"-controlled gear-box, propeller shaft,

Fig. 7.—The New Ariel 20-h.p. Car with landaulet body.

and bevel gear to a live axle. The wheelbase of the chassis is 9 ft. 3 in., enabling a roomy side-entrance body of the closed or open type to be fitted. Fig. 7 depicts one of the new models, with single landaulet body, recently supplied to Mr. A. St. G. Hamersley, one of the prospective Parliamentary candidates for Mid-Oxford. For the 1909 season three other sizes are being made—viz., 30-h.p., 40-h.p., and 50-h.p. The engines of these will be provided with overhead inlet valves, and lubrication by means of a pump. As to the chassis, the rear suspension is by means of three-quarter elliptic springs. The Ariel exhibit will comprise a 20-h.p. car fitted with special rotund side-entrance

body; a 20-h.p. town carriage, with landaulet body by Mulliner, Birmingham, painted dark green and lined with three black stripes, and picked out with crimson lines; a 30-h.p. show-finished chassis; a 40-h.p. Ariel 11 ft. wheelbase chassis, fitted with Dunlop detachable wheels, with special cabriolet-landaulet body by Mulliner, of Northampton; a 40-h.p. with a special touring phaeton, with round panelling and cane panelling, by H. J. Mulliner, London; and a 50-h.p. with special Pullman body by Rippon Bros., Huddersfield; the latter car will be complete with every refinement, and it is designed so that the driver is completely closed in.

The Dolphin Car with Two-Cycle Engine.

One of the novelties of the show will be the Dolphin 28-h.p. car, exhibited by the TWO-STROKE ENGINE COMPANY, LTD., of Shoreham. One of the principal features of the new car is found in the engine, which is on the two-cycle valveless system; it comprises four working cylinders set at an angle to a corresponding number of pumps or scavenging cylinders. We give in Fig. 8 a sectional drawing of a pair of the cylinders, which will enable the appended description of the method of operation of the new engine to be followed. Presuming that there is an explosion charge already in the working cylinder A, on this being fired the piston is driven down, and at the same time the pump piston B is drawn downwards, which again draws

Fig. 8.—Section through Two-stroke Engine Company's New Motor.

in a charge from the carburettor through the valve C. When the pump piston is at the bottom of its stroke it then rises and proceeds to compress the gas in the pump cylinder, causing the valve C to shut, and driving the compressed gas through the cross pipe to the valve D in the working cylinder. When the piston in the latter reaches the end of its power stroke it uncovers ports round the walls, allowing the burnt gases to escape. As soon as the pressure due to the exhaust gases is removed the valve D opens, admitting a fresh charge into the top of the cylinder A, this continuing until the pump piston B has reached the top of its stroke, which occurs simultaneously with the working piston covering the exhaust ports. The working piston now compresses the new charge, and is fired in the ordinary way on reaching the top of its stroke. It will be noted that the pump connecting rod, instead of being worked from the crank shaft, is connected to a forked connecting rod of the working cylinder; this gives the pump piston a slow suction and a quick delivery. The water-circulating pump, magneto, and contact maker are driven by bevel and skew gear off the four-throw crank shaft. Passing now to the transmission, the clutch is of an old design which has been in use on cranes and disappearing guns for a large number of years with perfect satisfaction. Briefly described, it might be said to comprise nine plates, four keyed to the outer casing and five to the centre shaft; the plates, instead of being of thin sheet steel or copper, are made of 5-16 in. steel and case-hardened. The gear-box, which gives four speeds, is fitted

throughout with large diameter ball bearings; the layshaft bearings are mounted in plumber blocks, which can be adjusted to throw the teeth of the gears deeper in mesh or otherwise, in order to render these free from friction and silent. This is done by the makers whilst tuning up the car and made a fixture, so that it cannot be altered by inexperienced drivers. The gears are operated by one lever, working in the conventional gate, and are positively locked in position, so that no two gears can be in mesh at the same time. The final drive is by a propeller shaft and bevel gear to a live axle. The latter is constructed so that the entire weight of the car is carried on the outer casing, which is forged from one piece of metal. On the front portion of the casing is fixed a strong aluminium casting, which not only carries the driving pinion, but also the whole of the differential, which being on plumber blocks, is affixed thereto by four substantial bolts; this gives great accessibility, for by removing the back casing and loosening four bolts, the whole differential gear can be withdrawn and inspected. The axles, too, can be drawn out for inspection by simply removing the hub caps. The steering gear is of the usual worm and segment type, with the exception that instead of there merely being a segment, a complete wheel is fitted, this allowing four separate wearing places on the wheel by simply taking out the steering arm and rekeying the same into another place when the wheel has been turned round. Provision is also made so that the rake of the steering column can be adjusted to any desired angle.

The Turner-Miesse Steam Cars.

The display of TURNER'S MOTOR MANUFACTURING COMPANY, LTD., Wolverhampton, will comprise a number of entirely new models, including a light car fitted with live axle, one model specially designed for two passengers, and one a light 10-h.p. touring vehicle fitted with a four-seated side-entrance body. This latter will be the leading model for the 1909 season, and, as it will be offered at a moderate price, it ought to meet the requirements of a large number of motorists who have a preference for steam. The Turner-Miesse steam cars are too well known to need anything but a brief description. The makers inform us they have perfected a paraffin burner—designed especially for the work of a medical man—which cannot blow out or backfire, no matter how long it is kept standing, and which can be turned up and down quite readily, doing away with the use of a pilot light except for lighting up from dead cold. No petrol is required with this burner, even during the operation of lighting up. The Turner-Miesse steam cars are fitted with a three-cylinder, single-acting engine, the great feature of which is that there are no glands or packing to require attention. The generator is of the "flash" type, and cannot fur up with long use. It is made in four sections, so that the bottom section can be replaced at trifling cost when necessary. The control is extremely simple, one pedal and one lever being all the driver has to attend to all the time the car is running. The lever governs the supply of water to the generator, and therefore regulates the speed, while the pedal instantaneously cuts off the steam, and when depressed still further puts a double-acting brake on the crank shaft. The advantage of this system is that the driver cannot carelessly put on his brake before cutting off the power. A very desirable point in these vehicles is the extreme accessibility of every part likely

Fig. 9.—The Turner-Miesse 10-h.p. Live-Axle Steam Car.

to require attention. The machines in general appearance closely resemble modern petrol cars. There is, of course, no vibration, and there are no change-speed gears to manipulate, the pace being entirely regulated, as already stated, by the amount of water that is allowed to pass to the generator.

The White Steam Car.

Considerable notice will be taken of the White Steam Cars for 1909, which represent a considerable advance on anything that has previously been shown by the White Company. On Monday the chasses

were assembled at the depôt in Carlow Street, Camden Town, N.W., under the superintendence of Mr. Frederic Coleman, who has just returned from the States full of enthusiasm for the new models, upon which he has had many long road tests in Cleveland. For next year cars of 15-h.p. and of 40-h.p. will be the standard sizes, and in both the design is identical, the parts being, of course, proportionately larger on the higher-powered vehicle. As in previous years, the generator consists of a series of coils of steel tubing located one above the other, and connected in series, the water being pumped into the upper coil, steam coming from the lower one, the process being so rapid that the steam is always available as required. The most

Fig. 10.—Front and Rear View of new White Steam Engine with covers removed.

significant change in connection with the new models is concerned with the engine, where, by the adoption of the Joy valve motion, greater simplicity of construction has been obtained. The number of working parts has been reduced to nearly one half of those formerly employed; the eccentrics on the crank shaft which were required with the valve motion previously fitted have been dispensed with, and by bringing the cylinders closer together a shorter crank shaft can be used. The latter is in one piece, forged of tool steel, and has only two main bearings, seen in Fig. 10, these being of the annular type. The ball bearings of the connecting rods are fitted with separators, the balls being of extra large size. Piston valves are employed for both high and low pressure cylinders. The steam is admitted through the centre of the valves, and is exhausted from the ends, so that the pressure on the valve stuffing-boxes is reduced to that of the exhaust from the respective cylinders. The lubricator is mounted on the dashboard, and is actuated by a ratchet device operated through a small arm on the end of the pump rocker shaft. The condenser is provided with an air-inducing fan driven by a chain from a sprocket on the forward end of the crank shaft, and the ratio of the sprockets is such that the fan-shaft runs faster than the engine. As a good draft of air between the condenser tubes is an important element in securing proper condensation, which means economy in water consumption, these improvements in driving the fan are of value. Accessibility has been carefully studied, and all parts can be easily reached by the removal of the side and bottom plates of the crank case. The cylinders (high pressure $3\frac{1}{2}$ in. bore, low pressure 6 in. bore, and $4\frac{1}{2}$ in. stroke in the 40-h.p. model, and $2\frac{1}{2}$ in. and $4\frac{1}{2}$ in. bore with 3 in. stroke in the 15-h.p. type) have relief valves for getting rid of any water which may be in the cylinders when starting the engine "cold." The engine is supported on two cross members of the frame, and all the weight is behind the front axle. The exhaust pipe from the engine to the condenser is on the right-hand side, and within it is a coil of piping through which the water from the pumps circulates on its way to the generator. Thus the feed water is heated, and the process of condensation aided in a very neat and compact way. The regulation of the supply of water to the generator and the supply of fuel to the burner are so controlled as always to be in perfect balance. When

the steam pressure rises appreciably above the normal working pressure, both supplies are stopped; then, when the pressure falls below the normal, water and fuel are again supplied in proper proportion.

In general appearance the new White models approximate more closely to the orthodox automobile design than anything yet introduced by the company. In the 15-h.p. chassis is the first steel frame which has been fitted to a White car. The wheel base is 8 ft. 6 in., with 32 in. wheels. The wheel base of the larger vehicle is 10 ft. 2 in., with 36 in. wheels, the frame being of armoured wood, the reinforcing plates of nickel steel being fastened on both sides of the wooden sills. The chassis is suspended about five inches nearer the ground than has formerly been the case. The removal of the water tank from the dashboard to a position under the floor boards adding to the conventional appearance. This tank has a partition at one end which, not reaching quite to the top, allows any oil which might float on the water to escape beyond into the empty portion of the tank, from whence it can be drawn at will. The petrol tank, which has a capacity for 150 to 170 miles in the 15-h.p. type, has also a spare apartment that can be utilised for an emergency supply. It is so divided that a small portion of the tank holds three gallons of fuel, which can be shut off from the rest of the tank. In this way the air pressure may be taken off the main portion of the tank, and the latter then filled. The burner is lit up from the small tank, and after the steam is raised air pressure can be pumped by the engine air pump on to the larger tank, which can then be put into operation. In this way

Fig. 11.—The Adams 14-16-h.p. Engine and Change-Speed Gear.

pumping air pressure on to the fuel tank by means of the hand air pump is practically eliminated. Another improvement has been introduced into the pilot light, tending towards durability, cleanliness, and efficiency. While the design has been carefully studied, the materials have had close attention, the drop forgings made by the White Company's own plant being a particularly strong feature. The new construction of the White chassis admits of the fitting of bodies of ample size, and in the coachbuilding department at Carlow Street, N.W., we have seen those in course of erection for the show chassis which will combine with the new models to place the White Steam Car in a forward position among the automobiles of 1909.

The Adams Cars.

The ADAMS MANUFACTURING COMPANY, LTD., who have always paid special attention to the construction of small cars, will give prominence to a 10-h.p. four-seated touring car. The engine is of the single horizontal cylinder type, 4½ in. bore by 6 in. stroke. The gear is adapted to give three forward speeds and a reverse, the control being by the company's system of interlocked pedals; by pushing any one forward, it positively frees any gear previously in operation. The car has proved so successful that few changes have been found necessary. It may be mentioned, however, that the bonnet has been lengthened, and its lines generally brought more into conformity with the general appearance of other light touring cars. A new model is the Adams 14-16-h.p. car. We give a view of the four-cylinder vertical engine and change-speed gear of this vehicle in Fig. 11. The cylinders are cast in pairs, the bore being 3½ by 3½ in. stroke. The crank-shaft is a solid forging steel, and runs on ball bearings of very large

diameter. The inlet and exhaust valves are situated on one side, being actuated off a single camshaft. The ignition is by magneto, the point of firing being fixed. The radiator is of a distinctive design, with ample cooling capacity. The pipes are of large diameter, and arranged for thermo-syphon circulation. Draught is induced by the fan flywheel of the engine. The change-speed gear is of the company's patent balanced planetary type, having wheels always in mesh, and giving three speeds forward and a reverse, and a direct drive on top with no gear wheels running. There is one pedal for each of the forward speeds and one for the reverse, all so interlocked that by pushing any one forward it positively frees any gear previously in operation. The final transmission is by cardan shaft and bevel gear to a live axle. The universal joint has large case hardened wearing surfaces and is entirely enclosed by a grease-tight cover.

The M.M.C. Six-Cylinder Cars.

The MOTOR MANUFACTURING COMPANY, LTD., one of the oldest concerns in the trade—they were established in 1896—will display the later models of their 35-45-h.p. six-cylinder cars. No startling features have been incorporated in the 1909 type, the object of the company having been rather to produce a vehicle which for all-round excellence and wearing qualities will equal any on the market. The motor, which has the six cylinders, 110 mm. bore by 150 mm. stroke, cast in pairs, is provided with a special system of water distribution, force feed lubrication to all crank journals, fan flywheel, magneto and synchronised coil and accumulator ignitions, and air brake. The change-speed gear is of the gate-controlled type, giving a direct drive on the top—third—speed. Ball bearings are fitted throughout the gear-box, which has a three-point suspension. The driving shaft is carried through a tube with spherical end to the cardan shaft, and this effectively bears all torque strains. The propeller shaft, which is well supported on ball bearings, transmits the power to the bevel pinion through a spring drive. All the brakes are centred on the rear wheel hubs, one set expanding internally, the other contracting externally. The steering joints are of a new type, which obviate the possibility of accident arising through the steering connections coming adrift, and allow any slack due to wear to be automatically taken up.

The Hotchkiss Cars.

The LONDON AND PARISIAN MOTOR COMPANY, LTD., inform us that the range of Hotchkiss cars for the 1909 season will include four models: 16-20-h.p., 20-30-h.p., and 30-40-h.p. four-cylinder and 40-50-h.p. six-cylinder. The 20-30-h.p. vehicle is a new introduction; it is fitted with an engine having the cylinders cast in pairs, the bore and stroke being 110 mm. by 130 mm. The ignition is by Eise-mann high-tension magneto. The details of the three other types remain very much the same as for 1908, slight modifications only having been introduced. They are all fitted with the Hotchkiss design of live axle, leather cone clutches, and a four-speed gear-box. In the case of the 40-50-h.p. six cylinder car an addition to the clutch is seen in the provision of a positive drive, this consisting of four projecting studs which, when the clutch pedal is fully released, fit into corresponding slots in the flywheel. The vehicles to be exhibited include a 40-50-h.p. with three-quarter landaulet body by Hamshaw, a 30-40-h.p. limousine by Million-Guiet, a polished chassis of the 20-30-h.p. and 16-20-h.p. models, and a 16-20-h.p. touring car with side entrance body by Melhuish.

The Calthorpe Cars.

While a year ago the CALTHORPE MOTOR COMPANY, LTD., Birmingham, confined their attention to a single model of 16-20-h.p., for the coming season two new types are being introduced. One of the main new departures in the Calthorpe vehicles is the adoption of the thermo-syphon system of water circulation, thus doing away entirely with a pump. The first of the new models is a 10-h.p. two-seater, fitted with a double-cylinder engine, 93 mm. bore by 123 mm. stroke, magneto ignition, thermo-syphon water circulation, Hele-Shaw disc clutch, gate-controlled change-speed gear, and ball bearings to all parts except the engine. The other is a 25-h.p. car on the lines of the company's "four-inch" car which secured the fourth place in this year's tourist trophy competition. The engine dimensions are:—Bore, 102 mm.; stroke, 130 mm. As regards the 16-20-h.p., a number of improvements have been introduced. Among these may be mentioned an increase in the stroke of the engine from 105 to 120 mm., the bore remaining at 93 mm., the adoption of a gate-controlled gear-box, and the fitting of ball bearings to the pressed-steel front axle.

(To be continued.)

MOTORING ACCESSORIES.

The Rotax Specialities.

CALLING at the extensive showrooms of the Rotax Motor Company, at 43 and 45, Great Eastern Street, London, E.C., we recently inspected several novelties that they are introducing to motorists, and a quartette of which we have selected for reference to on this occasion. These include an adjustable lamp bracket (Fig. 2), which has been designed to fix on the front dumb iron of a car without the use of bolts. In addition to being adjustable for a lamp of any size it can be fixed on any dumb iron, special provision being made for the taper. The Rotax adjustable bracket is quickly and easily fitted and detached when required, the fastening being made by two nuts easily removed on occasion. The bracket is made in several finishes and should attract considerable attention at the forthcoming show. The company is also bringing out a folding step to be carried on the foot board of the car, to which it is affixed with five bolts. When luggage is to be placed on the roof of a limousine or landaulet, the step can be quickly placed in position

Fig. 1.

and used without any risk of injury to the panels or varnished work. It folds completely out of the way and opens with only three separate movements being necessary. When elevated (Fig. 1) it gives a firm foothold and should prove effective in connection with all touring cars. The advent of winter makes a reference to the Rotax patent foot warmer appropriate in the present article. This consists of riveted copper plates attached to the existing cooling system and does not occupy more space than would an ordinary rubber mat. These foot warmers can be supplied in various shapes and sizes according to requirements and are brought into use by merely turning a tap. In connection with the storage of petrol the Rotax Motor Company have brought out

Fig. 2.

a new safety store which is constructed with a water channel all round the top. The lid shutting down into this effectually prevents the escape of any vapour that may be inside. A certain quantity of water is also contained inside the tank and a valve is provided at the bottom which is released when the lid is open, thereby allowing any superfluous water or petrol that may have leaked from the tin to pass out of the tank. Should any petrol become ignited inside it can be immediately extinguished by removing the lid. This store is made with a capacity for ten two-gallon tins and should prove of considerable in-

terest to our readers. The Rotax specialities are of sound construction as well as of excellent design.

C.A.V. Sparking Plug.

Messrs. C. A. Vandervell and Co., of Warple Way, Acton Vale, London, are introducing the C.A.V. sparking plug, which is guaranteed for two years. It is easily dismantled, without the necessity of removing the lower body of the plug from the engine, and is practically indestructible. In this device the electrodes are very substantially made of nickel, and the insulation is carried out with a treble-baked porcelain.

The Stepney Wheel.

The specialities which the Stepney Spare Motor Wheel, Ltd., of Llanelli, will show at Olympia, will include their "Stepney" wheel with flange attachment for facilitating the fitting of the Stepney wheel in case of punctures; the combination Stepney wheel for fitting to cars having different size tyres, on the front and rear wheels; the ring carrier, mudguard extension, sunproof and other devices incidental to the Stepney wheel. The special attraction for the coming season will, however, be the "Stepney" road grip tyre, which is being introduced to the public this week. Its novel features should attract much attention.

The "Orno" Foot Glove and the Lubrimeter.

Now that chilly days may be expected, the "Orno" foot glove introduced to motorists by Messrs. G. T. Riches and Co., of 19, Store Street, London, W.C., should be of considerable interest to a large number of our readers. The idea of its general appearance can be obtained from Fig. 3, and suffice it here to say that the foot-glove is made in soft black or brown leather and is lined with wool. It is kept in position by a pin at the heel, and, as will be seen, the feet can thus be kept warm without any necessity to keep

Fig. 3.

them cramped in any particular position. The device is extremely portable and we anticipate that it will be appreciated by those who have much driving to do in the open air during the coming winter. Messrs. Riches have now also taken up the agency for the Lubrimeter, an interesting device for use in conjunction with the engines of petrol cars, that was first introduced to the motoring public at the Cordingley Show at the Agricultural Hall in March last. As the name indicates, this appliance is intended to show the maximum and minimum levels of the oil in the crank chambers. This is done by means of lamps fitted on the dashboard, a red or white light being shown to demonstrate whether there is too much or too little oil respectively. The adoption of the appliance should prove a great convenience to motorists, offering, as it does, a check on all systems of lubrication. By means of the indicator on the dashboard one can ascertain the exact quantity of oil existing in the crank chamber, and so obviate foul exhaust and similar objectionable features. The use of the Lubrimeter also secures economy in the consumption of oil, while the fact that it can be fitted to any car gives it interest to every owner and driver.

The "L. M. De Luxe" Sparking Plugs.

From the United Motor Industries, Ltd., Poland Street, W., the sole British agents, we have received samples of the new "L. M. De Luxe" sparking plugs for coil and high-tension magneto ignition which have lately been put on the market. An examination of the latest plugs shows that while retaining all the good points of the old "L. M.," they have a better finish, that the terminal nuts are more substantial, and that the porcelains are of the very highest grade, and are of an orange colour. So confident are the agents as to the reliability of the plugs that they are guaranteeing them against all defects of any nature whatsoever, the United Motor Industries informing us that for all orange porcelain plugs that are returned to them with any sort of defect new ones will be sent in free exchange.

THE DAVIS PARAFFIN CARBURETTOR COMPANY has opened works at Station Avenue, Kew Gardens, S.W., to which address all communications should in future be sent, instead of to Shawford. As the motive power for the works is derived from an engine using the Davis carburettor, the company will be pleased to show the installation to anyone interested.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

UNIVERSAL JOINTS ON CARS AND SHAFTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We were very pleased indeed to note that you were calling attention in your issue of the 31st ult., under the heading of some "Useful Notes," to the attention that is necessary, and yet so very seldom given, to the universal joints on the propeller shaft of live axle cars. This is a part of a motor vehicle that is very often grumbled at for wearing badly, the cause of which is in a good many cases want of proper attention. We think the design of a number of cars is also greatly responsible for this, as not only are the lubricating arrangements very inadequate, but they are also fitted in such a way as to create unnecessary and very harmful strains upon the universal joint.

Owing to the joint having to be in rather an inaccessible position under the body of the car, special care should certainly be taken to let it run under the most advantageous circumstances. Very often they are left exposed, whilst in a number of cases they are merely covered with a loose leather covering, and filled up with grease in a very temporary sort of way.

One of the most common defects in design of the arrangement of the universal joint is that of making the rear axle move at a radius from a different point to that of the centre of the universal joint. In order to compensate for this, allowance is generally made either in the joint itself or for the end of the propeller shaft to slide. Now, when one

considers that these parts are expected to slide when they are taking the full pressure on their surfaces necessary to drive the car, it stands to reason that in a good many cases they do not slide at all, only when the road wheels are off the ground, or if they do slide, the surfaces are under very heavy pressure and naturally create wear. In the Sheffield-Simplex car we introduced a method by which the rear axle is always kept moving at a true radius from the centre of the universal joint, so that the same is relieved from all the strains mentioned. At the same time when carrying these out we enclose the joint in a steel globe, which enables the same to be run in a bath of oil the whole time; and further, to obviate the necessity for getting at the joint for lubrication, we arrange for oil to be supplied to the joint from our mechanical lubricator the whole time the car is in motion, so that in this case the universal joint is running under ideal conditions. The result of this has been a remarkable mechanical freedom in the running of the car, and has resulted, after 12,000 miles of running, in the universal joint showing absolutely no signs of wear whatever.

We enclose a section showing the universal joint, with the steel globe around it to illustrate the way it is constructed.—Yours truly,

PERCY RICHARDSON.

MOTORISTS, THE ROADS AND THE PUBLIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Every day we hear complaints about motorists. Remedies are occasionally suggested, but, generally speaking, the alterations proposed, from a common-sense point of view, commence at the wrong end. For instance, the outcry against dust:—Dust is the result of the way in which roads are made. In country districts nothing can be said against the use of granite, but much can be said against the use of the material with which granite is grouted. In most suburban places the material used is road scrapings. It does not require any practical knowledge of road-making to ascertain of what road scrapings consist when we see oats and weeds growing upon the heaps of scrapings which are to be seen in every country district. To put the matter plainly, road scrapings only require a little water to make them into a soft, slimy mud, consisting of worn granite and horse filth. The first shower of rain softens it, and the passing of wheels over the road causes this filth to squeeze up from between the pieces of granite and very quickly we have a plentiful supply of mud. A little sun and wind very soon converts this into dust, which is stirred up more or less by every passing vehicle, and scattered by the slightest breeze. We inhale it, our clothes get covered with it, it

blows into our windows and doors, and is in every sense of the word most objectionable.

District Councils during the last two years have, to a great extent, met this difficulty by tarring the roads; but they think that, having done so, their duty is ended. Common sense, however, points out that they are wrong, because dust will collect, and the habits of horses are not less objectionable because the roads are tarred. We do not get so much dust as we did before the use of tar, but what there is is of a more objectionable character. Why is dust and filth allowed to accumulate on tarred roads as it is in most places? In the district in which I live, before the roads were tarred, they were swept every morning, sometimes by horse brooms and at other times by gangs of men with hand brooms. I believe I am right in saying that, at any rate in this particular district, once a week is supposed to be sufficient. In some districts a wide road is supposed to be sufficiently tarred by the machine going once up the middle and leaving the sides as before. The consequence is pedestrians naturally prefer the cleanest part of the road and hooting becomes unnecessarily frequent to warn pedestrians that there are others requiring the use of the roads besides themselves. Surely, in the interest of all, there should be a place at the side of the road, to say the least, equally clean and agreeable for foot passengers.

There are also many complaints about the destruction of the road surface by wheels. Carts and waggons of course take their part in this destruction, but motorists get blamed for it all. Common sense would point out the necessity of the traffic being equally distributed over the road instead of being nearly all in the centre. One would say, compel everyone driving a vehicle of any kind to keep on the near side of the road; but this is neither safe nor possible in many districts because the roads are made with such an amount of camber that the only safe and comfortable place to travel is on the crown. I have never heard any bona-fide reason for this excessive camber. I have spoken to several surveyors, and the only one who has given any reason said "the road looks so nice when well rounded." From my point of view the remedy for many of the road inconveniences is to make the roads almost flat and compel everyone to drive on the near side. Excessive camber also causes another annoyance, which is, that heavily laden vehicles always take the crown of the road, and generally stick to it, which necessitates anyone overtaking them crossing right over to the off side of the road; then, if another vehicle happens to be coming in the opposite direction on the near side, there is of course a sudden pull up of both vehicles, much grumbling and frequently bad language, all owing to the fact that by reason of excessive camber it is not possible for the driver of the heavy vehicle to get along comfortably on the near side.

I wonder if there is a driver who has not frequently narrowly missed an accident in turning a corner on the near side. I narrowly escaped a severe accident myself only a few weeks ago. I was driving along a fairly wide road and had to turn down a hill to the left. Knowing the preference that other people have for driving on the wrong side of the road, I was turning this corner at not more than three or four miles an hour. A very high hedge was on my left and it was impossible to see more than a few yards in front. On getting about half way round the corner I was suddenly met by a man driving a horse (rather heavily loaded) which was coming up this little shoot out of the lane at a gallop—he was on his wrong side, of course. I stopped quite close in to the hedge and the man crossed to his right side just in time to miss my car. I called out to him, "Why don't you keep your right side of the road?" He replied, "I like to teach you to come round corners carefully." This is a specimen of what very often happens in country districts.

We hear that many people are annoyed by the excessive use of the horn. I have read of clergymen asking motorists not to use the horn outside a church during divine service. From my point of view the proper method of preventing this annoyance is to remove the cause—the effect will immediately disappear. The cause is loafers standing in the middle of the road and vehicles being driven on the wrong side. If the police had power to compel all drivers to keep the near side, and to prevent loafers congregating in the road, there would be no necessity for using the horn.

I think that a disregard for the comfort and convenience of others, i.e., selfishness, is the cause of a very great deal of annoyance throughout the country, not only with regard to vehicular traffic, but many other things. Is it not selfishness that causes a lady to go to a theatre with a hat the diameter of which is 2 ft., and sometimes more? Is it not a disregard for the comfort of others that causes the cock-crowing and the dog nuisance? There are thousands of dogs absolutely useless. It is quite easy to train a dog to come to heel and remain there. The well-trained dog enjoys a walk with his owner under these circumstances quite as much as the untrained brute who goes barking and yelping after horses, cars and bicycles. I wonder how many hundreds of cyclists have been thrown and seriously injured by these yelping, useless curs. It can only be a disregard for the safety, comfort and convenience of others which induces people to keep these beasts.

Lastly, with regard to the laws under which we, as motorists, have to exist. We have to carry a red and white light behind, the former to

show that a motor-car is in front, the latter to illuminate the number. With regard to the illuminating part of the business, it is an utter failure, and why can it be necessary to show that a motor-car is in front? We are never overtaken by other vehicles; but a brick cart or a heavy laden waggon, which is overtaken by almost every other vehicle, need carry no rear light. Surely this is an absurd law. Then with regard to leaving a vehicle unattended; a butcher or a baker may leave his horse outside a house and no notice is taken, but should a motorist leave his car for any length of time, he is fortunate if he escapes a summons. Yet the horse can, and frequently does, move either to the opposite bank for a feed of grass, or simply because he thinks he will, and the car cannot move. I have premises in a town near to a butcher who has a large business. I have seen four horses and carts standing without an attendant outside his premises and no notice whatever taken by the police. On the other hand, I have drawn up with my car and have been warned that I am causing an obstruction. Upon one occasion I had not been two minutes away from the car when I was followed by a policeman and requested to take it away at once. I remarked to the constable that I had only just got out of the car and had not been away two minutes. He replied "I can't help that, take it away. I am going to stir some of you motorists up."

I think that if a little more common sense on the part of all concerned with vehicular traffic, whether it be Councils, police or motorists, could be used, we should hear no more of the annoyance caused by motorists. —Yours truly,

E. W.

however, endeavoured to escape his patriotic obligation, and mislaid a portion of the engine in order to put it out of action. This subterfuge having become known, the Prefect of Police, acting on the existing law, will take action in the courts against the automobilist. The calling to the colours of automobiles in this way during mobilisation for manoeuvres or for exercises has been found to produce the best results; the automobilists learn to adapt themselves to all the necessities of military discipline, which renders them much more efficient in the case of actual warfare. —Yours truly,

ALFRED STEAD.

Roumanian Consulate General,
49, Parliament Street, S.W.

M.U. AND R.A.C.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The extraordinary attitude taken by the R.A.C. Committee calls for comment, and I am sure all reasonably minded motorists will agree with the resolution of the Derby and District A.C. Committee, which states "That the committee unanimously deplore the dictatorial tone in which the latter part of Clause 18 of such scheme (R.A.C. Associate Scheme) is framed, in which the R.A.C. states that the clubs *must* be associated with the R.A.C. *only*," &c.

It is somewhat difficult to believe that the R.A.C. Committee can genuinely have the good of motoring at heart when they deliberately

The Sisaire-Naudin Car which last week attained a speed of over sixty-five miles per hour on Brooklands Track and covered 100 miles in 1 hr. 31 min. 53 sec. In the picture M. Naudin is seen at the wheel, at his side being M. Sisaire and Mr. C. Jarrott.

THE SYSTEM OF TRANSMISSION IN RACING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly answer me through the medium of your valuable paper whether the majority of racing cars are driven by chains or by cardan shaft and bevel gear to a live axle? I have had a discussion with a friend on the matter, and I would like to have some definite information on the point. —Yours truly,

G. COTTERILL.

[There were forty-nine cars entered for the A.C.F. Grand Prix heavy car race in July last, of which twenty-nine were chain driven, while only twenty had live axles. On the contrary, in the voiturette race the bulk of the vehicles had cardan shaft and bevel gear transmission.]

MILITARY MOTOR-CARS IN ROUMANIA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may interest your readers to learn the following details with regard to the part played by automobiles in the Roumanian army. There has recently taken place the trial mobilisation of an entire army division, and in connection with this mobilisation the military authorities asked for the requisition of numbers of automobiles. This was carried out by the Prefect of Police of Bucharest, the choice being made by lot. Those automobilists chosen in this way at once placed their automobiles at the disposal of the authorities, and there were those whose names had not been drawn who voluntarily lent their vehicles, notably the general secretary of the Royal Roumanian Automobile Club. One motorist,

oppose all efforts which have been made to prevent division in the ranks of the various motoring clubs.

May I just draw attention to an interesting point in the way the R.A.C. carries out its promises. On page 25 of the R.A.C. Journal for January 9th, 1908, it is definitely stated that the work of the R.A.C. General (Associates) Committee is *not* subject to review—and yet within nine months, when this General Committee recommends that a joint affiliation scheme for clubs to join the R.A.C. and Motor Union be inaugurated—the R.A.C. Club Committee not only refuse this recommendation, but immediately make a rule to oppose it. Is not this submitting the General Committee's work to review. The associates have no control whatever, the R.A.C. Committee can alter and amend not only the whole Associate Scheme, but any action proposed by the Associates General Committee, and, in fact, have already done so.

There is a point in the scheme not generally recognised, and that is that the individual Associates (subscription £1 1s.) have only one representative on the General Committee for every 100 members, while the clubs which only pay a fee of 5s. for each member have one representative for every fifty members—a somewhat unusual rule.

Now on the Motor Union Committee the clubs and individual members are equally represented by one individual for every fifty members (approx.), the work of the committee is in no way subject to review, and it has ample funds to carry out its work—its income this year already exceeding £11,000. It has always made every effort to unite motorists and not to divide them; and at this critical time, when so much hostility is being shown, this is of supreme importance. The action of the R.A.C. is causing only dissension and division.

Anyone who remembers the events of 1902 will recollect that the

Motor Union was made an active body after the R.A.C. had for some sixteen months done all the work and had failed to call a meeting of the Motor Union Committee. As long as the R.A.C. had a working majority on the Motor Union Committee they had no fault to find with the agreement, but as soon as they began to be outvoted by the clubs and individual members they endeavoured to divide motorists into two camps. —Yours truly,

J. L. LOCK, M.A.

MOTOR MOBILISATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The R.A.C. is to be congratulated on the promptness with which it has followed the lead of the Lincolnshire Club in the matter of assisting the mobilisation of the Territorial forces. This, however, seems an object which can be better dealt with by the county organisations than by a central body, which can only act as an intermediary, with consequent delay.

The scheme outlined by the Lincolnshire A.C. secures that the secretary of that organisation, who has personal as well as written information concerning the abilities and the cars owned by the members,

any other outhouse which is less than twenty feet from the dwelling house?

(2) In the case of a posting establishment, where no special provision is made for storing petrol, are parties who keep their cars there in order in keeping petrol in the same building as their cars (other than that in the car tanks), if the proprietor or other people who have cars or carriages there raise no objections?

(3) In the case of a workshop which is isolated from other properties, could the proprietor keep a quantity of petrol in a wooden erection adjoining the workshop?

In the first case, the party is only endangering his own property, although of course his fire insurance company might have something to say about it. Of course there is also his servants' personal belongings.

In the second case, anyone keeping petrol in the building would be endangering other peoples cars, carriages, &c., which might be stored there.

In the third case, the party is only endangering his own property, if we except any of his workmen's belongings which may be in the shop at the time. The opinions of your readers on the foregoing will much oblige.—Yours truly,

CYCLE MECHANIC

Mr. Henry Farman en route in his Aeroplane from Chalons-sur-Marne to Rheims.

is the unit with which the War Office would immediately confer should occasion arise for the utilisation of their services. If every County Club organised its membership in the same way, it would be very simple for the War Office in Whitehall to communicate at any time with each county unit, so that in an hour or two those responsible for this branch of mobilisation would be informed of the duties expected of them.

But if the county organisations are only to deal with the central authorities through the medium of another organisation which can know little of the particular services which each district will require, much time will be lost and confusion often result. Therefore it is to be hoped that the interest in the matter which the central club has shown since the county organisation took the initiative will be restricted to a kind of sympathetic encouragement rather than to any attempt to mould the whole movement into its own particular groove.—Yours truly,

FREE LANCE.

STORING PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am not quite clear as to the reading of the Petroleum Act as regards private users. I understand that a private user can keep 60 gallons for his own use without a licence, but the premises in which it is to be kept I don't think are very clearly defined. To quote a few cases in point.

(1) If a gentleman's property is all enclosed by itself, no other proprietor's property being near, is he entitled to keep spirit, say, from a few gallons up to, say, forty, in the coachhouse where he keeps his car, or in

HILLS AND THEIR GRADIENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed in a recent issue of the *M.C.J.* some interesting figures respecting various hills. I have been in the West of England this summer, and about twelve miles west of Taunton, at a place called Wiveliscombe, there is a steep hill, and would like to know if any of your numerous readers could help me respecting the gradient; there are two hills, Wiveliscombe is between them. There are a few round Clovelly, Bude, and Boscastle and Bideford, but I cannot help as to what their gradients are.—Yours truly,

A CONSTANT READER.

[We have not been able to ascertain the gradients of the hills at Wiveliscombe; if any of our West Country readers can furnish the information we shall be glad].

REFERRING to the article on "Some Novelties at the Coming Paris Salon," in our issue of the 24th ult., Messrs. Panhard and Levassor ask us to mention that the chassis prices of the 15-h.p., 25-h.p., and 35-h.p. 1909 models are, respectively, £460, £600, and £720.

MR. D. DOYLE writes:—"In your last issue you publish particulars of the G.L. carburettor; it is therein stated that means are provided for introducing cold air to the cylinders for cooling and scavenging whilst coasting. This principle is by no means novel, and was first introduced by the writer some four years ago, and formed part of his claim in the patent known and sold as the Doyle valve, particulars of which were published in the *M.C.J.* about that time."

CHANGE-SPEED GEAR.*

By CHARLES WICKSTEED.

WE have arrived at this position. Given a first-class box, a first-class car, and a first-class driver there is little fault to be found. The gears are very seldom missed, and very seldom any noise to speak of is made. But neither all gears nor all cars nor all drivers will ever be first-class. The bulk of them will be second-class and many third. If a change-speed, therefore, can be devised that will do better with three third-class conditions than the sliding gear will do with three first, we must admit it is a great advantage. That is what I claim.

The details of the advantages that I claim with my gear I will set forth after I have explained what it is. Two hard steel taper clutches are connected with the gear wheels, which are always in mesh and which are thrown in and out of action as the clutches are pressed together or relieved. This is done by a screwed socket fitted with thrust ball races. There are, of course, as many clutches as you require speeds. The fast speed works direct on the main shaft. The screws are moved backwards and forwards by means of a crank shaft, which is actuated through a pair of bevel wheels through an upright pillar conveniently placed on the left-hand side of the steering wheel. The crank shaft, of course, keeps the clutches in time, so that when one is in gear the others must of necessity be withdrawn. To set up the clutches it is not necessary to take the lid off the gear-box, but only to remove the lid of the crank chamber, which is done by a thumb-screw. The rod is then lengthened slightly by means of the nut provided. In all cases the wheels form a part of the clutches, so that there are no extra parts to key on to the shaft. These parts are keyed on in the usual and most approved way by being pressed on to a taper with the extra security of one or two keys according to the load upon the wheel. The set nuts which adjust the thrust bearings have a small ledge on the outside when they are turned. This ledge is knocked down in three places into little grooves put in the sockets, which makes it absolutely impossible for them to move. The screwed sleeves or nuts that the actuating screws work in are screwed tight between the two halves of the box. But to prevent any possibility of their moving round a flat dowel is inserted between the upper and lower halves of the box cutting through the flanges.

To keep the crank shaft in exact position a small disc is placed on the crank shaft with four notches into which is sprung a V-shaped stop. The reverse, it may be noted, is simply a sliding motion actuated by small levers placed on the top and bottom of the actuating pillar. A locking bar worked by an eccentric from the crank shaft makes it impossible to put in the reverse when any other speed is on. The bottom half of the box is filled about half full of oil. No grease is used.

I have got a fair number of gear-boxes out to the often enthusiastic satisfaction of the users, and the first one I made I ran 9,000 miles before I took it out for exhibition. I have, of course, had my troubles, but in no single case have they been owing to the wear or giving way of the clutches.

A discussion followed, with Mr. M. O'Gorman in the chair.

Mr. C. W. S. Crawley said with some such form as Mr. Wicksteed's clutch change he thought it possible that the 'bus-driver might get on, even with the constant changes that he had to make the whole day. He would like to know how far the clutch surfaces separated, and if there was any difficulty from the film of oil between them still driving when they were apart.

Mr. A. Duckham said that there was one point upon which he wished to ask a question, and that was as to the nature of the lubricant employed. In the first place, he had always found in metal-to-metal clutches that one had to be very particular about the viscosity of the oil. One might have an oil that worked very well in summer but slipped in winter. Was there any difficulty in withdrawing these clutches, for the angles were very small, and it struck him that they might jam if they were let in fiercely? Further, was it necessary to almost fill the gear-box in order to secure perfect lubrication of the clutches? If so it meant considerable absorption of power.

Mr. J. S. Critchley said the standard gear from the engineer's point of view was a very barbarous piece of mechanism. He would never have thought that such a clutch could transmit the power that Mr. Wicksteed claimed. If Mr. Wicksteed had not had experience of that sort of mechanism for other purposes, he would not have had the courage to put in such a small size clutch. As to the wear of clutches, it appeared from Mr. Wicksteed's statement that they were the most lasting pieces of the mechanism. That was very gratifying to the outsider, who would naturally say that there must be wear of those small clutches, and that they would require attention from day to day.

Mr. J. Lyons Sampson said that it must have required great courage on the part of Mr. Wicksteed to bring forward a new arrangement of gear like that, when the barbarous and unmechanical Panhard sliding gear had practically driven everything else out of the field.

Mr. E. De Wilton, Mr. G. Koyle, Mr. Muntz, Mr. Oscar Thompson, and others having spoken, Mr. Wicksteed replied. He said Mr. Crawley had asked how far the clutches stood apart; the distance was about $\frac{1}{2}$ in., which was far enough for the oil to get in. As to the lubricant, he had worked with all sorts of oil, and could not see any sensible difference between them. The oil he used was engine oil. As to its being too thick on a very cold morning, it soon got warm.

*Abstract of Paper read before members of the Royal A.C. on October 29th.

A RULE OF THE ROAD.

ON Thursday of last week the First Division of the Court of Session, the Lord President (Dunedin) and Lords Kinnear and Mackenzie on the Bench, considered an appeal from the Edinburgh Sheriff Court which raised an important point with regard to the rule of the road. In the Sheriff Court at Edinburgh, Charles Douglas Macandrew, Edinburgh, had sued Henry Tillard, Cramond Bridge, for payment of £39. On July 17, 1907, a car belonging to the pursuer was being driven from Edinburgh along the Queensferry Road when it was run into by another car, owned by the defender. The defender's car was being driven along the road from Davidson's Main, and in attempting to cross the main road to Queensferry collided with the pursuer's car, which was thrown on to the embankment on the side of the road and damaged. The pursuer stated that the defender's car was being driven in a careless and reckless manner. The defender attributed fault to the driver of the pursuer's car in proceeding at an excessive speed. Sheriff-substitute Guy found that both the drivers were to blame for the accident, and absolved the defender, with expenses.

The pursuer appealed, and the Division has recalled the interlocutor of the Sheriff-substitute and found in favour of the pursuer, reserving the question of damages.

The Lord President said it was not possible in motor driving to lay down rules as to dealing with crossings. There were crossings and crossings, and the speed depended upon various things, such as the angle of the crossing, the breadth of the road, and the state of the hedges or

The 35-h.p. Deasy Car which has recently been supplied to Lord Fitzhardinge by the Deasy Motor Car Manufacturing Company, Ltd.

Particular interest in this vehicle lies in the body, which is of the cabriolet type and has been specially designed to meet his lordship's requirements. The back part is intended to be used either open or closed; when closed, it provides ample protection from climatic changes, and when open—the windows being let down and the front supports of the hood folded—it has the same advantages as an ordinary side-entrance touring body.

buildings which formed the angle of the crossing. All that could be said was that a driver should approach a crossing of a main road with caution and not at excessive speed. Looking to the conditions of this crossing, which was not a bad crossing, it could not be said that the pursuer's car, which was on the main road, was going at an excessive speed. But the driver of the other car knew he was crossing at right angles a frequented main thoroughfare, and if there was one rule more than another to lay down in such circumstances it was that it was the business of those who were crossing a main road to look out when they entered the main road and give way to all traffic going along that road. He did not mean that they should not cross until there was no one in sight, but that if there was any possibility at all of a collision it was the business of the person on the side road to give way to people on the main road. Accordingly a driver of a car on a side road should approach a main road with his car under control. In this case the driver of the defender's car came up to the main road with the intention of crossing at once, and only at a somewhat late time he gave way to the other car. The only way to account for the accident was that the driver of the defender's car had lost his head for the moment.

At their stand at Olympia the ANGLO-AMERICAN OIL COMPANY, LTD., 22, Billiter Street, E.C., will show the Royal Warrant they have secured this year for the supply of Pratt's motor spirit to the King, as well as a series of photographs of their plant at Silvertown for washing and filling cans. They will have a collection of aluminium cans in which their .760 spirit is packed.

CLUBS AND ASSOCIATIONS.

-6-
ROYAL.

ON Wednesday the list of candidates submitted to the Committee for membership of the R.A.C. contained 130 names, leading to the hope that by the end of the present year the membership roll will run into 4,000.

The Essex County A.C. and the North Middlesex A.C. have resolved to become associated with the R.A.C. at the expiration of the present affiliation agreement.

The R.A.C., under date of the 5th inst., has published the official circuit times of the cars competing in the recent Four-Inch Race in the Isle of Man.

THE AERO CLUB.

MESSRS. WILBUR AND ORVILLE WRIGHT have been elected members of the Aero Club of the United Kingdom, which has awarded its gold medal for 1908 to them for the remarkable achievements made in aerial flight.

BROOKLANDS.

AT Brooklands on Saturday M. Bablot, driving Mr. Clement Hobson's Grand Prix Brasier, beat the 60-h.p. long distance record by covering the ten laps from a standing start, about 27½ miles, at a speed of 101.778 miles per hour. On the previous day, on the same 60-h.p. Brasier car, he improved upon Resta's short-distance flying start record in the 60-h.p. class by 5 m.p.h. Some fine performances have been accomplished in record attacks at Brooklands track. On Friday of last week, F. Newton, on a 90-h.p. Napier, drove for half a mile from a flying start at the approximate rate of 117 miles per hour, which beats the record.

DERBY.

AT the committee meeting of the Derby and District A.C., on the 29th ult., it was reported that on the question of affiliation replies in connection with the postal vote were still coming in, but that to date the result stood:—For the Royal A.C., 55; for the Motor Union, 36; for neither, 5; for either, 1 (out of a total membership of 183).

The hon. secretary also read a letter from the Midland A.C. as to a conference of provincial clubs on this question at Birmingham on November 14th, asking for the names of delegates from the Derby A.C. These matters were discussed, and, as the members were so divided, it was resolved that the club be represented at the meeting in question, and Dr. Copestake, Messrs. A. Ford and E. H. Fryer were chosen to attend. It was also decided to call an extraordinary general meeting on December 1st to discuss and definitely settle the matter of future affiliation.

A letter was read from Messrs. Duckham stating that, on account of the lack of interest taken by other clubs in the proposed lecture on "Oils," it had been abandoned.

SCOTTISH.

AT a meeting of the Executive Committee on Monday the Sub-Committee on Inconsiderate Driving submitted details of the action which had been taken by the Club with a view to the stopping of improper driving and excessive speeds, particularly in towns, villages, and populous places. Schedules were submitted showing that reports had been made by the special Club agents as to the driving of 1,562 cars, and a list was submitted of the cars comprised in that number whose owners had been communicated with on account of the speed of the car being greater than was considered by the sub-committee to be proper at the time and in the place where the observations were made.

A number of cases of inconsiderate and reckless driving, which had been reported by members of the Club and others, were considered, and the action which had been taken by the sub-committee thereon reported. The Secretary was instructed as to the finding of the meeting in each case, and as to the communication to be directed to the parties concerned.

Reports, verbal and in writing, were submitted from the delegates to the International Road Congress held in Paris from October 11th to 18th. It was agreed to invite the members of the Road Surveyors' Association to take part in a conference to be convened by the Club on an early date, when the principal points dealt with or the resolutions arrived at by the Congress might form subjects of discussion.

It was reported that the Buteshire County Council had agreed to ask for prohibition of motor-cars on the String Road in Arran, and it was resolved to offer strong resistance to the proposal.

It was intimated that conferences had taken place with the Provost and Magistrates of Dunfermline and with the Provost, Magistrates, and Town Council of Irvine with regard to proposals for speed limits in their respective areas, and that after discussion both these bodies had agreed to refrain from any such proposal meantime, the Club having arranged to erect certain notices and caution boards in each place.

THE Barnaleigh and District A.C. is supplying M.U. direction posts to the corporation of the town.

THE FLOW OF LIQUID FUEL THROUGH
CARBURETTOR NOZZLES.*

IN this paper the author continued certain investigations which were referred to in the one he read last year before the Society of Engineers. The action of a jet, as far as its properties of carburating air by means of liquid fuel are concerned, was considered, and its objects are set forth under the following heads:—1. To regulate the rate of flow of the fuel to suit the demands of the engine. 2. To disintegrate the fuel mechanically into the finest particles possible. The regulation of the amount of heat required to supply the latent heat of evaporation and the temperatures which are reached under different conditions are given. It was shown how a temperature of 10 deg. C. would be reached if the theoretical proportions of air and petrol were combined and evaporated in 1.40th second, the time taken for the mixture to flow from the carburettor to the engine.

The viscosity of fuels at different temperatures has been investigated by the author, who gave some tables, being results of experiments he has made by means of a special instrument and also with actual orifices of various sizes. The effect of the alteration of specific gravity, due to the rise of temperature, was also taken into account. The tables showed that the rate of flow of a spirit, such as petrol, is affected to a considerable extent by increasing its temperature. Comparative tables for benzol and petrol were given, which showed that with a small orifice or with a low pressure head the friction upon the fuel appears to be greater in the case of benzol than in petrol, but as the size of the jet was increased the two fuels behaved almost alike, certainly within the limits of experimental accuracy, the benzol being slightly more viscous.

The next matter considered was the relation between suction pressure and the air velocity, the paper being accompanied by curves which enable the ordinary user of liquid fuel to determine, by a simple calculation, the suction pressure at the carburettor jet in any specific case. Examples were worked out in the paper to demonstrate the application of this method, and the results were checked by actual experiment with a manometer. Cross checking was done by utilising the curves and tables which have been determined for the rate of flow of liquids through the orifices used. The tables make it apparent why extra air inlets are required in many types of carburettor, and show the effect of this extra air admission upon the system of carburation.

One of the most important features of the paper was the diagram of results of a large series of experiments upon the rate of flow of petrol through small orifices. A series of carefully constructed orifices was obtained, graded and drilled to 1.100th millimetre in diameter. These were in turn fitted to an instrument and the time noted for a sample quantity of fuel to pass through under various pressure heads. A table showed the rates of flow in gallons per hour under various conditions, which enables the diameter of the jet for any particular engine to be predetermined with some degree of accuracy. The author also pointed out that small aperture jets are somewhat erratic in their behaviour, which may account for some of the carburation disturbances in actual practice. An example of the rates of flow for a jet of 1.40 mm. diameter is 1.8 gal. per hour at 55 deg. Fahr., with a pressure head of 180 mm. of the fuel; but when the temperature of the fuel was raised to 70 deg. Fahr. the rate of flow increases to 2.14 gal. per hour. The pressure head corresponding to any given engine speed can be determined from the curve shown, and knowing the proportions of fuel to air required to give the best results, the size of jet can be read off from the curves. The paper showed how mean values for ordinary road conditions can be obtained by a simple system of cross checking.

The investigation was made with the object of clearly and graphically showing the action of a carburettor and the relations of the various dimensions, and their effect upon the resulting mixture of fuel and air. The author hoped that by means of simple reasoning the average user would be able to eliminate trial and error methods, and at the same time obtain a clearer understanding of the mechanical principles of a carburettor.

AUTOMOBILE ACCIDENTS.

AN inquest was held at the Sussex County Hospital, Brighton, by the Borough Coroner, Mr. J. E. Bush, into the circumstances attending the death of George Downes Whittle, aged 77 years, who was knocked down by a motor-car on the London road on Sunday last. After hearing the evidence the jury returned a verdict of "Accidental death," and attached no blame to the driver.

Two fatal motor-car accidents are reported from Birmingham on Saturday, a woman being knocked down in Suffolk Street by a car that was being driven slowly, the witnesses agreeing that the driver had no chance of avoiding the woman. She was conveyed to the Queen's Hospital, where she died. A few hours before another woman who had been knocked down by a motor-car died in the same hospital, and in that case, too, the car was said to be travelling at a moderate rate of speed.

THE business of the Oxford Street Motor Company is now being carried on under the new title of Automobile Markets, Ltd. The company have a large selection of second-hand cars on hand at their depot at 151, Oxford Street, London, W.

*Abstract of paper read by Robert W. A. Brewer, A.M.I.C.E., M.I.M.E., M.I.A.E., at the Society of Engineers on November 2nd.

CASES AGAINST MOTORISTS.

A PROPER DISMISSAL.

Miss L. L. Boustead, of Wimbledon, was brought before the local petty sessions on a summons for not stopping the machinery of a motor-car when stationary on the 9th ult. The police evidence showed that defendant, who was in charge of her father's car, left it in front of the London and County Bank, High Street, for three minutes without stopping the machinery. The Bench dismissed the summons, and the chairman (Mr. C. Tyrrell Giles, K.C.) said the case did not call for serious consideration at their hands or those of any other magistrates.

THE BROMLEY SPEED LIMIT.

At the Bromley Petty Sessions, several motor-car drivers were summoned for exceeding the speed limit of ten miles in certain streets in Bromley. Many of them complained that the notices were not sufficiently prominent. It was pointed out, however, that the notices were in accordance with the rules and regulations.

One defendant said that had he known there was a limit he should have gone slower. Inspector Vincent Coster said that the notices must be put where the limitation of the speed commenced. The Chairman added that no doubt attention would be drawn to the matter, and that if a notice was not in its proper place its position would be altered. Another defendant was fined £5 and 12s. costs, or in default one month's imprisonment. He had not sufficient money to pay the fine and costs, and left the court in custody.

a very serious thing to convict a motorist of driving to the common danger without more evidence than they had in this case of really careless driving. They also thought the man who was driving the cart was partly to blame, driving smartly and very likely not looking out. The case would be dismissed.

DRIVING IN CROWDED STREETS.

Captain H. W. Hill, of the Royal Artillery, appeared at the Thames (London) Police Court, on Tuesday, to answer a summons for driving a motor-car in a manner dangerous to the public.

Constable 939 K stated that on October 21st he was regulating traffic in the East India Road, and assisting children, who were leaving school, across the road, when defendant drove his motor-car on the off-side of the refuge, thereby knocking down two children, each aged 3½ years, both of whom had had to be medically treated. At the time the traffic was stopped, and Captain Hill now stated that he pulled up immediately. There was no traffic within 200 yards on the near side. He went that way merely to pass the traffic. Mr. Chester Jones said when defendant saw the line of traffic was on one side and he went on the other it was a very embarrassing thing for the public. In London, especially, cars had to be driven with great care, and it was clear defendant drove to the common danger. He would be fined £10 and 4s. costs.

AERONAUTICAL MATTERS.

THE matter of the Aero Club of Germany's decision to award this year's Gordon Bennett Competition Cup to the Swiss entrant *Helvetia*

Two of the Austrian Daimler Road Trains which took part in the recent Industrial Motor Vehicle Trials organised by the Austrian Automobile Club. *(Allgemeine Automobil Zeitung.)*

HEAVY HAULS.

During the last few days several motorists have been before the courts at Guildford (fines on one day totalling £70), one of the defendants being a lady; Cambridge (4), Kingston (4), Morpeth (2), Acton, Barnet (3), Wimbledon (5), Southend (2), Godalming, Haywards Heath (fines totalling £120 on Monday), Bromley, Kent (4), Garstang (2), Littlehampton (7).

A DISMISSAL AT HAYWARDS HEATH.

On Monday, at the Haywards Heath Petty Sessions, Albert Lewsey, chauffeur, was summoned for driving a motor-car in a manner dangerous to the public, at Stonepound Crossways, Hassocks, on October 22nd. Several witnesses having given evidence, Mr. C. H. Waugh, for the defence, said nobody regretted the accident which had occurred more than the defendant, but no evidence had been given to show he was to blame. Evidence of a collision was not evidence sufficient to convict defendant of driving to the common danger. Had the accident been avoided by an inch or two there would have been no charge preferred against defendant. The wheel marks showed the car to have been on its proper side, and if the car had been travelling at the speed alleged the cart would have been smashed to smithereens, whereas not a spoke of its wheel was damaged. All the damage was received by the motor-car.

The Chairman said the police were justified in thoroughly going into this case. The cross-roads were extremely dangerous, and anyone driving a motor-car should go past with great caution. He thought six miles an hour would be quite sufficient speed. At the same time it was

proceeds another stage, for the Aero Club of Great Britain and Ireland is forwarding a protest to the German Aero Club against its ruling. A meeting of the permanent committee of the International Aeronautical Federation is to be convened to discuss the question.

At the Caxton Hall, Westminster, on Tuesday, Captain W. G. Windham read a paper, under the auspices of the Civil and Mechanical Engineers' Society, on "Balloons and Aeroplanes." After pointing to the progress made with dirigible balloons, he dwelt at length on the recent successes with aeroplanes. With the aid of lantern slides he described the aeroplanes of Mr. Wilbur Wright and Mr. Farman, as well as the machines constructed for aerial flight by other inventors. He added that the Aeroplane Club that had recently been started in London had excited much interest, and 640 members had already joined.

THE Coventry Chain Company inform us that they supplied the chain for the drive of the eccentric shaft of the new Daimler silent engine.

THE County Chemical Company, Ltd., are just now experiencing a heavy demand for their "Chemico" and "G.B. Carbide," "G.B. Special" and "Searchlight" burning oils and other lines incident to the period of long evenings. In carbide alone, "Chemico" and "G.B." brands—without in any way considering the output of raw carbide—orders are just now claiming upwards of three tons daily.

FORTHCOMING EVENTS.

NOVEMBER.

- 10th (Tu.).—Meeting of the Incorporated Institution of Automobile Engineers to discuss the report of the Society of Motor Manufacturers and Traders on Horse-power Formulae of Petrol Engines.
- 11th (W.).—Prof. B. Hopkinson, at Institution of Automobile Engineers, on "A Complete Test of a Modern Petrol Engine."
- 13th (F.).—Inquiry into the application of the Surrey C.C. for ten mile an hour speed limits at Walton-on-Thames, and in certain thoroughfares in Woking.
- 13th-21st.—Olympia Motor Show, London.
- 14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club, Hotel Metropole, London, S.W.
- 18th (W.).—Annual Dinner of the Motor Union.
- 20th-23th.—Stanley Show at the Royal Agricultural Hall, London, N.
- 25th (W.).—Annual Dinner of the Founder Members of the Royal A.C.
- 26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.
- 28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

- 13th (Sun.).—Closing day of the Paris Salon.
- 23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

JANUARY, 1909.

- 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
- 26th.—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

War Office Fourteen-days' Trial for Light Tractors.

LIGHTING-UP TIMES—LONDON.

| | | | | | | |
|---------------|-----|-----------|-----|-----------|-----|-----------|
| Nov. 7th—5.23 | ... | 9th—5.18 | ... | 11th—5.15 | ... | 13th—5.12 |
| " 8th—5.20 | ... | 10th—5.17 | ... | 12th—5.14 | ... | 14th—5.10 |

To find the approximate lighting-up time in November for Birmingham 5 minutes should be added to the above times, 5 for Manchester, and 8 for Glasgow.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

At a general meeting of Messrs. Charles Jarrott and Letts, Ltd., held last week, the recommendation of the Board that a dividend of 50 per cent. on the year's trading should be paid to the shareholders was carried, and such dividend has since been paid, the balance being carried to reserve. The various departments of the business include the handling of every type of car, from the light runabout to the powerful vehicle, and the fact of their having paid an average of over 50 per cent. each year of trading for the last five years is evidence of the excellence of the cars they are handling and the demand existing for them.

The Reliance Taxi-Cab Company, Ltd., has just offered 195,000 10 per cent. preferred participating ordinary shares for subscription by the public.

The twenty-second annual meeting of the shareholders of the London Improved Cab Company, Ltd., was held on Monday, with Mr. E. H. Bayley in the chair. Referring to the advent of the motor-cab, which had completely revolutionised the business, he said they had had a cab chassis specially designed for their purpose. This had been tried on the streets and had given good results. The chassis now proposed to be adopted has passed all tests, and it is proposed to commence with a supply of 150 of these vehicles. The company have eleven depots conveniently situated in various parts of London.

At the meeting of the Spare Motor Wheel of America, Ltd., at Birmingham, Mr. T. D. Drayton presided, and it was announced that owing to the strain put on the wheels by the roads in America, it was found necessary to make a stronger wheel than was used in Europe. The difficulty between the company and the Rim Association had been overcome, and the sales are now steadily increasing. Given time for development, the chairman assured the shareholders that they had a property that would, in the future, yield a handsome return.

POLICE "CONTROLS."

At Trumpington, near Chelmsford, the police have a measured quarter of a mile.

There is a trap on the London road at Rayleigh.

LANCASHIRE has several traps, notably on the Bolton and Chorley road and also the Chorley to Preston highway.

The police are watchful of motorists on the road between Rottingdean and Newhaven, and also between Lewes and Eastbourne.

MOTORISTS travelling from London to Surrey and the South will not only be interested in knowing that there is a furlong trap between Hammersmith Bridge and the "Red Lion," Barnes—cars generally being timed at thirty miles an hour—but that Putney Bridge is having tram lines laid over it, already half the bridge being lined with rails.

ROAD REPORTS.

HAMPSHIRE.—Several well-conducted provincial papers make a feature of giving reports as to the roads in repair in their localities from time to time. Among these is the "Hampshire Chronicle," from which we learn that among the highways now being dealt with by the authorities is the main road from Christchurch to Salisbury, that between Fareham, Drogham and Alton, the portion of the Portsmouth and Petersfield main road at Purbrook, and several important roadways in the Andover and Basingstoke districts.

HONITON.—The road about a mile east of Honiton, leading from Honiton to Monkton, is under repair, but the stones are rolled down each day before being left, so as to cause little inconvenience to traffic.

CROYDON.—The main Brighton road through Croydon has been up for repairs to the tramway track every night recently between West Croydon Station and the "Swan and Sugar Loaf," South Croydon. These repairs are expected to be completed to-day (Saturday.)

NEW L.C.C. BY-LAW.

THE new by-law of the London County Council referred to in our comments is as follows:—

I.—The acts and things specified in the following clause, numbered 13, are hereby prohibited and declared to be offences:—

13.—Drawing, driving, or propelling at a rate exceeding eight miles per hour, or so as to endanger the public, or drawing, driving, propelling, standing, or placing, on or across the ground or turf, on or over any footpath, or in any shrubbery, any gun or gun-carriage, limber or waggon-cart, carriage, van, velocipede, bicycle, tricycle, truck, wheelbarrow, or vehicle, or using for heavy traffic any road restricted by the Council to light traffic, without the consent of the Council in writing under the hand of its clerk, or learning or teaching the driving of any motor vehicle.

PUBLIC SERVICES.

THE Siddeley motor taxi-cab has been introduced into Capetown.

MR. HERBERT GLADSTONE (Home Secretary) states that on September 30th the licensed cabs in London numbered 11,122—namely, 2,273 motor cabs, 5,095 hansom cabs, and 3,754 four-wheeled horse cabs.

MOTOR taxicabs have been introduced into Dundee, the magistrates having approved of the proposal of a company to run these vehicles in the streets of the city. The fares to be charged are on a similar scale as those in operation in Edinburgh and Glasgow.

ON Monday the Vanguard motor omnibuses which had been running from Hampstead to Charing Cross and Victoria ceased to ply on that route.

BUSINESS NEWS.

MESSRS. C. E. WHITTAKER, LTD., inform us that purchasers of Imperia cars become at the same time possessors of a very useful document in the shape of a *passé-avant*, which frees them from customs formalities when entering Belgium.

MESSRS. GIBSON BROS., plate and sheet-glass merchants, 23, Duncan Road, London Fields, N.E., are making a speciality of plate-glass for use in the wind screens of motor-cars. The glass is supplied in all shapes and sizes and in thicknesses from $\frac{1}{8}$ to $\frac{3}{4}$ in.

THE Lanchester Motor Company, Ltd., Birmingham, have just issued a very exhaustive descriptive manual of their 20-h.p. and 28-h.p. cars. The work, which is exceedingly complete and fully illustrated, should prove indispensable to users of these vehicles.

LEYLAND MOTORS, LTD., have sent us a copy of the new catalogue they have just issued; this gives very complete particulars and illustrations of their well-known steam and petrol industrial motor vehicles, motor-buses, &c. Included in the list is a description of the Leyland factory, particulars of some good tests carried out with their steam wagons, and some useful diagrams affording a ready means of transforming kilometres into miles and *vice versa*.

IN addition to the gold medal awarded in the class for machine appliances at the Franco-British Exhibition, Messrs. Hans Renold, Ltd., were awarded a similar distinction in the class for apparatus for the transmission of power.

THE carelessness of a few motorists has raised such a storm of protest everywhere that the general public are beginning to imagine all owners of motor vehicles are their enemies and should be dealt with in a really drastic manner. This unfortunate idea has been increased by the misleading statements of people, who should be better informed, to the effect that motor vehicles are a luxury of the rich. The fact that motor vehicles are in constant use for trade purposes, and an increasing number of professional men, doctors, and others are using automobiles, seems to be entirely lost sight of. An enquiry at the London and Paris Exchange Agency, Ltd., has disclosed the fact that a number of second-hand private cars are daily being converted into delivery vans, &c., which in itself is a proof of the growth of the motor for business purposes. When it is realised that more motors are used for commercial purposes than otherwise, the storm of protest will cease, and attention be paid to the actual evil.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, NOVEMBER 14, 1908.

[No. 506.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

NOTICE.

Comment will doubtless be expressed at the absence of "The Motor Car Journal" from its familiar place at the Motor Car Exhibition at Olympia. This, however, is from no fault of our own, application for space having been made in the early part of August, and on several subsequent occasions; but, according to the latest information from the responsible management, there is no space available; and so "The Motor Car Journal" has no *locale* at Olympia this year.

COMMENTS.

Trials in 1909.

WITH regard to the R.A.C.'s programme for 1909 we understand that the Expert and Technical Committee have decided that, should a trial of Tourists' Cars be proposed, suggestions which have been placed before them by Mr. Worby Beaumont shall be considered. The committee have decided to recommend the award of the Club's silver medal for the best Speedometer submitted for test during the coming year, and a sub-committee has been appointed to consider the programme of Trials and Competitions. In this connection the debate which took place on Monday under the auspices of the Society of Road Traction Engineers with regard to the value of organised trials from the commercial users' point of view is of interest. At the end of a two hours' discussion the resolution moved by Mr. Percy Frost-Smith to the effect that their value was *nil* was lost; the general opinion being in favour of such events. This is in direct opposition to the views of the makers of touring vehicles so far as the 1908 long-distance event was concerned.

The Wolseley 1909 Programme.

SOME of the new models of the Siddeley cars were submitted to the critical inspection of a number of members of the motor press at the depot of the Wolseley Company at Westminster, S.W., on Tuesday. Interest principally centred round the 20-30-h.p. six-cylinder *modèle de luxe*, full particulars of which will be given in our next issue. Mr. J. D. Siddeley briefly explained the Wolseley programme for 1909, which was to produce vehicles of moderate horse-power but of the highest grade of construction. Although their cars had not been entered in public competitions during the past year, they had an extensive experimental department at their works, and were always experimenting with the view of improving their vehicles. Hitherto the construction had been carried out in two factories—one at Adderley Park, Birmingham, and the other at Crayford, Kent. It had, however, been decided to concentrate the manufacture under practically one roof at the first-named

place, where extensions are in hand, and where the power plant is being increased to the extent of 500-h.p. In connection with several burning topics of the moment in the motor world, Mr. Siddeley expressed the view that the valves on a modern petrol engine give so little trouble that they may be considered as non-existent. As for the question of stroke in relation to bore, he did not think it made much actual difference whether motors were made thin and long or short and fat; the latter was, however, the lighter in weight for an equal amount of power developed.

Criminals and Motorists.

In a previous issue we alluded to the evident excess in the number of police in the rural Metropolitan area, and the paucity of constables in the town districts, as evidenced by the number of undiscovered crimes. At Kingston, on the occasion of the summoning (reported on another page) of Sweeney by the Commissioner of Police, there were ten constables and one inspector in uniform in the small court most of the day, apparently doing nothing. Such a state of affairs should appeal to the ratepayers, and, as we understand there are numerous bodies of Metropolitan tradesmen banded together to keep down the rates, the above fact should be noted.

The Dust and the Car.

THE report of the Dust Committee of the R.A.C. for the year that is now closing has just been issued, and deals exhaustively with the tests that were carried out at Brooklands in the summer. Some conclusions will be of special interest; notably the official endorsement of the view that the tar treatment of roads, instead of being additional to the ordinary cost of maintenance, will so preserve the surfaces that the life of the metalling will be greatly prolonged, with consequent saving to the ratepayers. The improvement in this direction is becoming general throughout the country, but this, of course, in no way reduces the necessity for further investigation with a view of such modifications in the shape of car bodies as will prevent the dust that is always present on any road surface from being disturbed. On this point the committee has come to the conclusion that cars with the very small body clearance of 6 in. from the road surface are found not to disturb or to raise any dust from a thick coating laid between cleanly swept wheel tracks up to speeds of forty miles an hour. It is therefore practically certain that the dust nuisance arises entirely from the action of the air currents caused by the movement of the cars through the air, on the dust which has been previously raised to a moderate height by the wheel tyres.

Conclusions.

THE result of the experiments leads to the following conclusions:—"Hard tyres are better than soft ones, narrow tyres than broad ones. Armoured tyres are sometimes better and sometimes a little worse than plain ones. Plain tyres vary very slightly among themselves, except that old worn tyres appear to raise more dust than new ones. Casing in the spokes so as to produce disc wheels causes some, but hardly

noticeable, improvement." With regard to the fitting of a plain, flat, rectangular, smooth casing under the car, this is said to produce good results so far as minimising the dust-stirring properties of the cars themselves. It can be so easily applied to existing vehicles that the committee emphasises this feature as being capable of being fitted by most owners at small expense. They, in fact, go so far as to say it is certain that any car owner who drives a car of average clearance, but which has irregularities such as those caused by large fuel tanks or silencing arrangements projecting below and interfering with the regularity of the under surface, is continuing to use a car which the committee find in most cases is practically certain to be a public nuisance.

The Rating of Engine Power.

LAST week's meeting of the Commission appointed by the R.A.C. and the Institution of Auto. Engineers to report upon the rating of motor-car engines was adjourned to a date yet to be arranged. Meanwhile, while the Rating Committee of the latter body is in substantial agreement with the S.M.M.T. as to the desirability of amending the present R.A.C. formula, they have, after considering a variety of reports, come to the conclusion that the experiments submitted in the report of the society do not justify the proposal of a new formula. It is, therefore, suggested that a new committee be formed to discuss the exact nature of the tests to be made in order to supply data for accurate comparison by formula.

North to South.

THE trip which Mr. J. H. Paterson has just taken from Aberdeen to London on an 18-24-h.p. Peugeot car was decidedly an excellent performance. It was under the observation of the Scottish Automobile Club, and of course the legal limit was not exceeded. The run from Aberdeen, via Perth, Stirling, Edinburgh, Berwick, Newcastle-on-Tyne, York, Doncaster, Stamford to London, was one of 550½ miles, and occupied 27 hours 58 minutes in all from the evening of Tuesday, the 3rd inst., to nearly midnight on the following day. The engine did not stop from the commencement to the finish of the trial; the petrol consumption was equal to 16.18 car miles per gallon, and 31.146 ton miles per gallon or .032106 gallons per ton mile. During the journey three gallons of lubricating oil and half a pint of water were filled into the tank, and the only stops on the road were voluntary ones, for lighting lamps, &c.

M.P.'s v. Motorists.

LAST week the anti-motorists in the House of Commons held a meeting which was attended by fourteen or fifteen M.P.'s, who, on Monday, commenced their campaign, which, for the present, will consist of a series of questions hurled at the Local Government Board and the Home Office. Mr. Harold Cox led the way, and called attention to the increase in the number of accidents which had occurred in which motor vehicles were concerned. Mr. Gladstone, while recognising that the number of accidents was serious, pointed out that it was almost inevitable with the great growth of motor traffic, while the figures which have been so freely bandied about have included the returns for casualties in which tramcars were concerned. Supplementary questions were asked by five other members, all calculated to impress the public with the heinous crimes of which motorists are said to be capable. Replying to a suggestion that Germany had a speed limit of nine miles an hour in all villages, Mr. Burns was able to reply that "as one who was in Germany last year, I can only say I did not see that speed limit." An important point was raised by Mr. Pickersgill, who drew attention to the cases which have occurred of late, in which owners of vehicles had rebuked the police when their chauffeurs have been stopped for driving a car at an excessive speed. The Commissioner of Police is, according to the Home Secretary, consider-

ing individual cases of this kind, and will be prepared to proceed against the owner for abetting, should the circumstances in his view justify such a course.

Speed in London.

THE Conference of Representatives of the Metropolitan Borough Councils which met the other day to consider the speed of motor traffic in London was scarcely unanimous, and the decision in favour of limiting the speed of motor-omnibuses within the four miles radius of Charing Cross to eight miles per hour was only arrived at by fifteen votes to ten. Councillor J. E. Taylor, of Wandsworth, made a strong protest against the undue restriction of the speed of motor vehicles plying in the public service as likely to lead to a restriction of a growing industry. The demand of the public was for accelerating the pace as compared with the age of locomotion which London has tolerated in the past; and hence to thwart and hamper the new locomotion was an undesirable thing to do.

The Traveller-Motorist.

ON Monday night the committee stage of the Licensing Bill in the House of Commons was brought to a close, the final discussion being concerned with the schedules. Mr. J. Hope had put down a new schedule which was concerned with a bona fide traveller. As the Bill stood any person who has travelled six miles from the place of his previous night's lodging can claim to be a "traveller," no matter how the distance has been covered. Mr. Hope proposed to draw a distinction between a pedestrian and different classes of riders. His proposed schedule was thus worded:—

Minimum distances for bona-fide travellers:

For a person proceeding entirely on foot, six miles.

For a person proceeding any part of the way in any vehicle drawn by animals, fourteen miles.

For a person proceeding any part of the way by any cycle other than a motor-cycle, eighteen miles.

For a person proceeding any part of the way by any motor-cycle or motor-car within the meaning of the Motor Car Act, 1903, thirty-six miles.

The discussion was, however, brought to a conclusion before the amended proposal was reached. Had it been subjected to debate, vigorous opposition would doubtless have been made to a suggestion which differentiated between pedestrians and motorists but took no notice of railway travellers. Why, too, did not Mr. Hope consider the likelihood of the aeroplane upsetting his calculations?—not so great an improbability, judging from the confident tone of the speakers at the inaugural meeting of the club whose formation is recorded elsewhere in the present issue.

Cars Registered this year.

By the favour of the Chief Constables of some of the leading cities and towns we are able to place before our readers exclusive information with regard to the motor-car registrations and licences lately issued to drivers. At Newcastle-on-Tyne seventy-one cars were registered during the year ended September 30th, as well as 148 motor-cycles; 760 licences were issued to drivers. At Coventry the numbers have, of course, been larger, and from the beginning of January to Saturday last 321 cars and 212 motor-cycles were registered, while 852 drivers were licensed. During the first ten months of the year 449 cars, 234 motor-cycles and 2,330 drivers were authorised in Manchester; for the year ended September 30th last 896 new licences to drive motor vehicles were issued at Birmingham, where 325 cars and 285 motor-cycles were registered in the same period. The Public Control Committee of the London County Council report that for the three months ended September 30th last applications for the registration of 1,806 motor-cars, fifty-three heavy motor-cars, and 373 motor-cycles had been dealt with

bringing the total number of these vehicles up to 23,717, 1,980, and 9,211 respectively. The number of general identification marks issued was twenty-five; 124 duplicate licences were granted, and 407 copies of entries in the Council's register were furnished to the public. Changes of ownership in 1,452 cases had been dealt with, the total number of such changes since the beginning of the Council's administration being 6,740 cars and 4,102 cycles. The number of licences to drive motor-cars and motor-cycles issued was 6,489, bringing the total number up to 89,604.

Theory and Practice.

IN face of the large amount of space the daily newspapers are just now devoting to automobiles, consequent on the opening of the Olympia Show, it is difficult to believe that it is only about two months ago that many of them opened their pages to a general attack on motorists and motor-cars. There were many who feared that the prolonged discussion would have a serious effect on the motor movement, but fortunately, like most "silly season" topics, it has passed away with no more result than having supplied the newspapers with column after column of "copy" at a time when general news of attrac-

ciated by all Englishmen, and it would be interesting to know what difference there is in a high speed race against time as against a race between two cars. Dangerous racing, according to Mr. Edge, must be a matter of speed and horse-power in view of the fact that he allowed his entry to stand for the 'Four-Inch' race in the Isle of Man even after his public withdrawal from racing, and if such is the case I cannot see how he can reconcile his action in sending a 90-h.p. car to break records at Brooklands at a speed of 115 miles an hour. Perhaps Mr. Edge has found out that high speed racing in some form or another is vital to his business, and if such is the case it is interesting to see how quickly he is capable of changing his opinion."

One, Two, Three.

POSITIONS are reversed with regard to the cabs in the metropolis, and instead of motor vehicles being now attracted by three shrill blasts, one call is to be sufficient. Such is the Order that has issued from New Scotland Yard over the signature of Sir E. R. Henry, who says, "In view of the large and increasing number of motor-cabs now plying in the streets, it is considered that it will meet the convenience of the public generally if, instead of the usual three blasts of a whistle for a

The photograph reproduced above depicts a party of five gentlemen, all over seventy years of age, who were recently taken for their first motor trip by Mr. W. H. Cox, of the Clydesdale Garage, Lanark. Over 100 miles were covered, the elderly passengers being delighted with their experience.

tive interest was extremely scarce. There was one incident in the discussion, however, to which great importance was attached at the time, so much so that even the "Times" founded a leading article on it. We refer to the letter issued by Mr. S. F. Edge, in which, "in deference to public feeling," he announced his intention of withdrawing Napier cars from all dangerous competitions. The announcement was, however, coupled with a claim for liberty to qualify "this declaration of my withdrawal from abnormal contests" and "lead the way again if I have mistaken the trend of public feeling." While the majority of the public has probably forgotten all about Mr. Edge's letter or the discussion which led to it, there are those in the motor trade who, having been criticised for not adopting a similar policy, are naturally not inclined to let its sequel pass unnoticed. Among them is Mr. Charles Jarrott, who in the course of a letter received from him a few days ago draws our attention to the fact that "one of Mr. Edge's cars driven by one of his drivers has during the last few days been breaking records at Brooklands at a speed of over 100 miles per hour, which could only be accomplished by risking the neck of the driver and must therefore be considered dangerous according to generally accepted ideas." Mr. Jarrott adds, "Sincerity is a quality appre-

motor-cab, one blast be substituted, three blasts being the call for a four-wheeled cab. On and after November 8th, 1908, therefore, the code is to be:—

| | | | | |
|--------------------|-----|-----|-----|----------------|
| For a motor-cab | ... | ... | ... | One blast |
| For a hansom | ... | ... | ... | Two blasts |
| For a four-wheeler | ... | ... | ... | Three blasts." |

Thus does the motor-cab obtain recognition of its early rise to popularity.

TO-DAY (Saturday) is the anniversary of the Motor Emancipation Day, 1896.

MESSRS. MESTRE AND BLATGE have secured temporary offices at 15, Blythe Road, Hammersmith, W., where they will have a display of their motor specialities during the week of the Olympia Show.

AS it is somewhat difficult at night-time to ascertain easily whether a taxicab is engaged or free, Mr. H. S. A. Foy, of Bush Lane House, E.C., suggests that a small coloured light under the flag, which would tell at once, according to its colour, whether the vehicle is available or not, might be employed. The same movement which turns down the flag could change the light, and, of course, the illuminating power is a simple matter.

MOTERING ACROSS AUSTRALIA.

FROM ADELAIDE TO PORT DARWIN.

(Concluded from page 763.)

THE sandy spinifex desert extends for about 500 miles. We crunched across the silent country with varying fortunes. Sometimes our pace was beaten down by exasperating successions of natural obstructions to ten miles per day; at other times we made good with a seventy mile run for the day. At one place we took three hours to do five miles. Sturt's Plain is seventeen miles across. "Lakes Woods" is here marked on the map. No doubt it is a big swamp in the winter time, but when we struck it it was dry, and the bottom was pitted with horrible holes hidden under rank grass. We bounced across the place somehow, and blundered into a mass of thick scrub, wherein it was impossible to see a way fifty yards ahead. The branches broke the lamp off the car. Plenty of niggers were seen hereabout, but they were all poor and skinny, and apparently too weak to harm anybody. But now we began to notice a change in the temperature. The nights were warmer, and from Catherine River on to Pine Creek the track became fair. We did sixty miles a day for a stretch. Crossing the Catherine and Lucy Rivers, we simply raced the car into the water, and the momentum carried her through before the engines got properly wet. We took the precaution, however, to cover them with canvas.

We picked up the old car, in which we made the previous attempt to cross the continent, at a spot between Barrett's Creek and Tennant's Creek. All the winter's rain and months of glaring sunshine had played upon the old car in her open-air garage without doing much more damage than to warp the wood-work. The tyres were still inflated. We switched a battery on to the mechanism, and it started off at once. Mr. Allchurch joined us at Alice Springs, and came through the rest of the journey with Mr. Dutton on the old car, whilst I went on in front with the newer one. They did us well at Port Darwin, and I am not appalled in any way at the prospect of another trip.

Of the country he crossed Mr. Aunger does not speak with great enthusiasm. For two months—January and February—thirteen inches of rain falls. And that is an end of it. Immediately the sun gets to work, and in a marvellously short time grass springs up to four feet in height. But it is hard, useless stuff—no use to cattle. It remains stark and blackened on its stalks well into the blighting summer, till a furnace-blast of wind sweeps it all away, and the country is bald desert again. "Maybe such land can be turned to some use," says the motorist, "but it will take a long time."

The utility of such a journey may perhaps be questioned by the man in the street, who asks for results in season and out of season. At least it may be claimed that the trip proved the wonderful strength of modern motor vehicles. The journey will rank with other continental tours like those across Asia and the

Motoring Across Australia.—Two typical views of the country passed through by Messrs. Dutton and Aunger.

At Pine Creek, the southern terminus of the Northern Territory railway, we were told it was simply impossible to go any further, and were advised to truck the car on to Port Darwin. But we had not gone that far to be defeated. We pushed on for eight miles to Union Town, and further to Bridge Creek, which was a misnomer, for we had to get out and prepare a crossing for ourselves. Here the tropical jungle fairly swallowed us up. We simply had to roll the car upon it. The growth was dense, and as the branches swished down above us myriads of abominable insects were scraped off the foliage and dropped upon us. The jungle is alive with green ants—yes, positively green, and in untold millions. As numerous and gay are the spiders with red and yellow tails. They dropped upon us like rain for miles. It was one of the nastiest experiences of the trip. The creatures did not bite, but it was abominable to have them crawling all over one. The jungle extended forty miles, and then, on August 20th, we broke out, hot and happy, upon the main road leading into Port Darwin—our task accomplished.

Our car had come through the trip with no more serious mishap than the breaking of a couple of the springs, to which we fitted new leaves, and the tyres sustained only three punctures. At least one of these was caused by a sharp-pointed native fire-stick, many of which the blacks leave strewn about the country at their various camping grounds. The front tyres never called for inflation during the whole trip.

Sahara Desert recently reported. And certainly Messrs. Dutton and Aunger have opened up possibilities of a grand motor-car route which will one day link up Northern and Southern Australia, leading to trade development and settlement and a shortened route to Europe.

THE Wilkinsburgh A.C. (S.A.) has passed a rule urging its members never to pass a disabled automobile without stopping and offering assistance, and suggesting that "every car should carry a manilla rope, 25 ft. long and $\frac{3}{4}$ in. thick, for emergency."

SINCE aviation has become well within the reach of practical politics the phrase "in the air" bids fair to lose all its old visionary aspect. Certainly some remarkable achievements have been accomplished quite recently in France, the country which fostered so assiduously the development of the motor-car. Considerable interest is now being evinced in the exploits of M. A. Clement, a leading light in the French automobile industry, and vice-chairman of Clement-Talbot, Ltd. The fine new Clement-Bayard airship, with its engine of 120-h.p. and carrying six people, made its first trial last week in the immediate vicinity of Paris with great éclat. Since then M. Clement has carried out quite a number of lengthy trips, and he contemplates in the near future a series of journeys from Paris to the large provincial towns, commencing with one to Lille and back, a distance of some 290 miles. Afterwards a trip to London may be undertaken.

GOSSIP FROM PARIS.

“Is there a crisis in the automobile industry?” is the heading given to several articles which have appeared here in daily political newspapers as well as in technical journals. The reply found for it may be summed up in a few words, which confirm what I stated in the *M.C.J.* many weeks ago. A transformation is being operated, and if there has been a crisis it was chiefly due to the over-production of big cars with heavy bodies, not only costing dear to purchase but also entailing heavy expense for fuel and upkeep. Consequently the sale of these big touring and town cars has fallen off very considerably, but, on the other hand, the demand for vehicles of moderate horse-power has become so great that, if only the manufacturers know how to take advantage of it, their continued prosperity will be insured for a long time. According to official statistics there are only about 30,000 persons in France possessing independent means of £2,000 a year and upwards, and there are already close on 40,000 high-powered automobiles in the country! The demand of the rich for such cars is therefore fairly well supplied, and now the makers must turn their attention to the needs of the middle classes, hitherto too much neglected. What they want is a good reliable chassis of comparatively low horse-power.

RECENTLY a Paris journal sent a circular round to all the principal provincial motor-car agents asking what type of vehicle was in the greatest demand. Eighty per cent. of the replies indicated cars of from 8-h.p. to 10-h.p., costing between £180 and £240. Almost all the leading automobile manufacturers have understood this so well that the Salon to be opened on the 28th inst. will contain next to no novelties in the way of big cars, while new types of small vehicles will be found on almost every stand. The exhibition of 1908 will be “The Small Car Salon.”

M. BARTHOU, the French Minister of Public Works, who was taken to task so roundly for his bill on automobile traffic, went to the Committee of the Chamber last week, saying that after all he did not think any further legislation on the subject was necessary for the time being. The Minister is organising an International Conference to discuss the question, and he asked the Committee to leave things stand as they are till the Conference had reported. He promised he would then present to Parliament a complete bill regulating the traffic on roads of all descriptions of vehicles, carts, carriages, wagons, &c., as well as automobiles. The Committee thought, however, that it must do something. So, when the Minister had withdrawn, it decided it would send in its report to the Chamber with as brief a delay as possible, demanding the adoption of the two clauses which are all that now remain of M. Barthou's famous bill against which such an outcry was raised. If the motophobes in the Chamber and Senate do not succeed in modifying them, or in introducing into the measure any of the vexatious stipulations eliminated from the draft bill by the committee, motorists will have no reason to complain. Clause 1 of the proposed measure stipulates that the driver's licence can only be withdrawn temporarily or definitively by a decision of the correctional police court or by the appeal court, and Clause

2 enumerates the officials legally qualified to draw up a “procès verbal” concerning a breach of the traffic laws and regulations. Though he did propose to defer the public debate for a few months, M. Barthou, who has become untiring in his professions of solicitude for the automobile industry, now says the above clauses must be regarded as nothing but the preface to the complete reform of the highway laws he will present to the Chamber after the close of the International Conference.

NOVEMBER 5th was already an historical date in the annals of Parliament by the discovery of Guy Fawkes's plot to blow up the British House of Commons, but for the future it will be yet more celebrated. When transit will be commonly effected through the air, November 5th, 1908, will be remembered as the day on which a parliament first recognised the conquest of the ethereal realm as an accomplished fact. It was M. Barthou, the French Minister of Public Works, who, in reply to an interpellation from M. d'Estournelles de Constant, proclaimed in the French Senate that the French Government and Parliament could not remain indifferent to the “marvellous progress of aerial locomotion.” His speech, which occupies more than four columns of the “Journal Officiel,” testifies to the importance the

public powers in France attach to this newest of the new means of locomotion, destined perhaps to revolutionise society, and, if the hopes expressed by the Minister and applauded by the whole House without distinction of political party be realised, “to create greater harmony among the peoples of the world and to insure peace between nations.” To demonstrate the impossibility of setting a limit to the future of aerial navigation, M. Barthou reminded the Senate that only a few years ago an eminent member of the Academy of Sciences declared it was “absurd” to talk of “setting” the problem of steerable balloons, because it could not even exist. “Well,” added the Minister, “that problem has not only been set, but

Touring in the Ardennes.—A Halt at Dinant.

[D's Auto.]

solved, and aviation has entered definitively into the phase of practical realisation.” M. Barthou rightly claimed for France her share in this marvellous progress, which he said would “profit the whole human race,” but he did not forget to pay a graceful tribute to the Brothers Wright. He said, “It is my duty to remind you that at the other extremity of the world, in South Carolina, two energetic men were found who during five or six years, in the face of indifference, lies, and even suspicion, realised one of the most marvellous inventions of the human genius.” He could not have admitted more gracefully and candidly that, if the French aviators were the first to ride the wind publicly, the Americans had in private solved the problem of aerial navigation several years before.

MARNEY.

LEYLAND MOTORS, LTD., are at work on the construction of a light steam single-deck motor-bus. Except for the boiler, engine, and absence of change-speed gear-box, the new vehicle is similar to the 35-h.p. petrol chassis manufactured by the same firm. The boiler is placed in the front part of the chassis behind a condenser. The engine, which has three vertical single-acting cylinders capable of developing nearly 60-h.p., is located underneath the driver's seat.

D

CONTINENTAL NOTES.

Motor Traffic Regulations in Holland.

The Upper Chamber of the Dutch Parliament has recently adopted a new automobile law which authorises local authorities to limit the speed of motor-cars within their jurisdiction to 10 kilometres ($6\frac{1}{4}$ miles) per hour. Hitherto motorists in Holland have enjoyed great liberties with regard to speed, there being no definite speed limit, but the driver was held responsible in case of accident. Every effort was made by the automobile organisations of the country to prevent the passage of the new law, but without avail; thus, for instance, a series of speed and brake tests were arranged at Scheveningen in the presence of a member of the Cabinet and numerous representatives. The limit of ten kilometres per hour can, however, be enforced only in communities where there are special local conditions rendering higher speeds dangerous.

German Motor-car Imports and Exports.

A very quiet state of affairs continues to prevail as regards the imports of motor-cars into Germany. The arrivals of plea-

at Toury. After three short flights a gust of wind caught the machine at a critical moment, and it fell to the ground and was completely smashed. M. Bleriot, however, fortunately escaped without injury.—In the French Senate last week, M. Barthou, Minister of Public Works, referred to the great progress which aviation had made in France, and added that he had a sum of £4,000 at his disposal, which he would put to the best possible use towards the development of the art of flying.—A prize of no less than £4,000 is being offered by the International Sporting Club of Monaco to aeroplanists who, on three separate days, accomplish a flight from Monaco across the water to Cap Martin and return. The competition will be open from January 24th to March 24th. The aeroplanist who is classed first will get a sum of £3,000, the second will be awarded £600, and the third £400. Each machine is to be provided with means of floating on the water in case of accident. The distance from Monaco to Cap Martin and back is about seven miles.—The French National Aerial League has also just announced that it has been entrusted with the founding of another valuable prize, a challenge cup of the value of £2,000. This will be awarded

The Inauguration of a Public Motor-Car Service in Russia.

A public service of Laurin-Kleiment cars was recently started in Moscow. The scene at the inauguration, by means of a religious ceremony, is depicted in the above illustration.

sure and industrial motor vehicles and chassis into the country during the nine months ending with September last only attained a value of £547,600, as compared with £749,000 in the corresponding nine months of 1907. On the other hand, the value of the similar exports from Germany during the same periods advanced from £530,600 to £535,650.

Aeronautical News.

On Thursday, last week, a banquet was given by the Aéro Club de France in honour of Mr. Wilbur Wright. M. Barthou, the Minister of Public Works, presided, and among the numerous aeronautical experts present was M. Cailletet, who presented the brothers Wright with the gold medal of the Aéro Club. Mr. Wright, in thanking France for the unexpectedly warm greeting which he had received, recalled the scepticism which attended the earlier feats of flying. He had even himself, as late as 1901, remarked to his brother that men would not fly in the next fifty years, and two years later he and his brother had flown themselves. In these circumstances it was particularly unwise to prophesy as to the progress of aviation in the near future.—M. Bleriot's aeroplane met with another accident on the 5th inst.,

every six months to the aviator holding the record for the best flight on an aeroplane in a straight line. At the end of three years the cup will be definitely awarded to the record-holder. The League also offers a prize of £800 for the winner of a contest over a fixed course of 20 kilometres at the aerodrome at Savigny-sur-Orge.—A new aeroplane known as the Antoinette, built to the designs of Messrs. Levavasseur, Gastambide and Mengin, is now being tested at Issy-les-Moulineaux.—M. Maurice Farman, brother of the now famous Henry, is engaged on the construction of a new aeroplane.—On Saturday last the Crown Prince of Germany made a trip in the Zeppelin airship and remained in the air about seven hours.

Miscellaneous Items.

The German military transport department is at present engaged in testing the motor vehicles of such firms as are desirous of receiving Government subventions in 1909. The trials will last three weeks, the daily distances being fixed at from 120 to 140 kilometres, on the Berlin-Dresden-Gotha-Cassel-Magdeburg-Berlin routes.—The annual Belgian Motor Car Exhibition is to be held in the Palais du Cinquantenaire, Brussels, from January 16th to 25th next.

THE SOCIAL WHIRL.

THE KING celebrated his sixty-seventh birthday on Monday at Sandringham. Early in the morning his Majesty with the Queen and the Prince and Princess of Wales motored to Gayton, the residence of the Earl of Romney, where they inspected the Royal West Norfolk Hounds, and afterwards halloed them away to the Gayton coverts. They followed the Hunt for a short distance in their car, and then returned to Sandringham House.

LAST week I was able to anticipate the motoring programme of the Princess of Wales whilst a guest of the Marquis and Marchioness of Londonderry, at Wynyard Park, Stockton-on-Tees. Other members of the motor party were the Duchess of Devonshire and the Earl of Shrewsbury.

SIR CHARLES E. SHAW, M.P., whose name appeared in the King's birthday honours list, is a keen automobilist, and a member of the General Council of the R.A.C.

SEVERAL bishops having been presented with motor-cars, similar honours are about to be accorded to lord-lieutenants. A movement has just been initiated in Warwickshire to acknowledge the services rendered to the county by the Marquis of Hertford, and it is suggested that the presentation should take the form of a motor-car. Among motorists interesting themselves in the movement are the Earl of Warwick and the Marquis of Northampton, while Lord Willoughby de Broke is also among the subscribers.

SEVERAL social events have taken place this week. On Wednesday, the Society of Motor Manufacturers and Traders held a dinner at the Hotel Metropole, the principal speakers being Lord Ribblesdale, Sir West Ridgway, Sir Marcus Samuel, and Col. H. C. L. Holden, R.A. On the previous day Mr. Samuel Samuel, of "Shell" spirit fame, gave a dinner, at which Mr. Joynson-Hicks, M.P., said it was an open secret that the Chancellor of the Exchequer had made up his mind to put some additional taxation upon motor-cars. Speaking for himself he (Mr. Hicks) said if the revenue were devoted to the improvement of the roads it would be better than devoting it to iron-clads. The Motor Union's annual dinner next week will gain in importance from the presence of Mr. T. McKinnon Wood, M.P., the Under Secretary for Foreign Affairs.

THE Rev. A. C. Oliver, vicar of Barlaston, has been appointed hon. secretary to the committee of Stoke-on-Trent motorists who are protesting against the Town Council's application for a ten mile limit on the road from Stoke to Trentham. The Duke of Sutherland, K.G., president of the R.A.C., will probably give his support to the local motorists.

So much having recently been said as to the reason for the attitude of the M.P.'s who are agitating against motorists the letter which comes to the M.C.J. office from Mr. Arnold Herbert, who represents the southern division of Buckinghamshire, will be of interest. He is a good sportsman, fond of country pursuits, and believes "That what gives most ground of complaint against motorists is that they in effect claim to use the roads without reference to traffic which is already on them, and that they habitually drive at a pace unjustifiable in the circumstances of this country. It is astonishing to me that motorists allow their chauffeurs to drive with a want of consideration which no gentleman ever would have allowed his servants in charge of his horses to be guilty of." I do not accept Mr. Herbert's suggestion that motorists as a body are indifferent to other traffic on the road; but the point of view is so general that they may take warning and exercise care on every occasion they are on the roads.

MR. HERBERT will be interested to know that the Legal Committee of the R.A.C. have drawn up a form to assist the General Committee in dealing with the expulsion, or otherwise, of members who are proved guilty of inconsiderate driving.

LOLLIUS.

HERE AND THERE.

THE Edinburgh Corporation is in the market for the supply of an 18-24-h.p. chassis suitable for an ambulance.

THE Companies' Diary and Agenda Book for 1909 comes from Messrs. Jordan and Sons, Ltd., in its familiar and useful form.

A SPECIALLY fitted 16-h.p. motor ambulance wagon is being supplied by the Albion Motor Company to the Newstead fever hospital.

As a result of the great progress that has recently been made in flying machines in France a movement is on foot to organise an "Aeroplane Salon" in Paris in May or June next.

ACCORDING to the Under Secretary for the Home Department 1,095 motor-omnibuses are at present licensed by the Commissioner of Police for the Metropolis, and of these 595 are reported to be of foreign origin.

MESSRS. LEVER BROS., LTD., of Port Sunlight, have just placed an order for eight large motor-van chassis with Commercial Cars, Ltd., Luton. The vehicles are to be fitted with specially designed bodies, and are intended for service in the London district.

At the last meeting of the Brentford Urban Council, Mr. J. Clements, who, on behalf of the Council, attended the recent conference at the Mansion House on motor traffic, reported that the meeting was the most unfair he ever attended. He said that everyone who wanted to say anything in favour of motorists was howled down.

MESSRS. BROWN BROS., LTD., have sent us a sample of a new ignition wire terminal—the Duco—they are introducing. This is British made, and the part that fastens to the sparking plug is slotted to permit of it being slid under the milled nut of the plug without screwing the latter right off. The ends are turned so that the terminal cannot slip off, and if the milled nut is screwed tight, the ends also act as a kind of lock nut.

We learn that the London and Parisian Motor Company, Ltd., of 87, Davies Street, W., have secured the sole concession for the sale of "Delage" cars in the United Kingdom, and have arranged that a model shall be shown on their stand at Olympia. The car is of the voiturette type, and is manufactured with either one or four cylinder engines. It will be remembered that the Grand Prix des Voiturettes in July last was won by a Delage machine.

FROM Mr. H. G. Dryden, of the North-Eastern Railway Company, comes a copy of the new issue of the Directory of Manufacturers and also importers and exporters on the N.E.R. system. There are about 27,000 entries in the list, including references to motor-car engineers and motor body builders as well as the various trades incidental to automobilism. The Directory will be of considerable interest to all engaged in trade in the extensive district covered by this railway.

As alcohol is now so much in demand for industrial purposes a new source of supply in the Colony of Queensland is worth noting. The Minister of Lands in Queensland, the Hon. J. T. Bell, stated last September that he had concluded arrangements with a company or syndicate who proposed to exploit parts of the Darling Downs to obtain alcohol from the grass tree, and he had let them have some 400 miles of country by about 100 miles in depth along the coast, commencing at Caboolture. "Prickly Pear," a cactus pest, is also to be used for this purpose.

MANY motorists now systematically repair their tyres as defects present themselves, and, being thorough in their methods, frequently prefer a vulcaniser that will repair the inside of the tyre as well as the outside. Although Messrs. Harvey Frost and Company, Ltd., have several trade appliances that will do this, they had not, until recent times, a vulcanizer for the use of the private motorist with which interior as well as exterior tyre repairs could be executed. The H.F. Garage Vulcanizing Equipment, which completely meets the requirements of the private car owner, has conveniently filled the breach, and, as most motorists appreciate the importance of looking after the fabric of a tyre, as well as its exterior, this vulcanizing equipment is now in good demand.

"MOTOR-CARS have ruined my trade," said a saddle-tree maker who appeared at Shoreditch County Court the other day on a judgment summons issued by a Walsall firm. "Only last Tuesday," he added, "I was so'd up by the High Bailiff of this Court."

APPEARING at the Midhurst Petty Sessions charged with driving a motor-car at excessive speed at Cocking, a motorist has just offered to subscribe towards the purchase of a car in order to secure that the police shall be more experienced in the matter of motors. The offer has not been accepted.

THE Doherty Motor Components, Ltd., of Earl Street, Coventry, have lately brought out a new type of radiator for petrol cars known as the "Tubicomb." As will be gathered from the name and from the sectional illustration herewith, the object of the designers has been to produce a radiator which, while having the appearance of the honeycomb type, is so constructed that the possibility of leakage is almost entirely eliminated. The vertical flat tubes are fitted with interlocking vertical and horizontal strips on both the back and front; the whole is then tinned and so formed into a solid unit. The flat tubes completely do away with the core of hot water which exists in the case of round tubes, and are thoroughly protected by the interlocking honeycomb strips. The makers claim that the method of construction allows a very large number of the cooling tubes to be fitted in a comparatively small space, and that it is stronger than that of

the honeycomb, but that the principle of cooling the water is practically the same, and in appearance the two are identical. Furthermore the "Tubicomb" is lighter than the usual patterns, and, owing to its simplicity, the cost of production has been considerably reduced. The Doherty Company are also exhibiting at Olympia for the first time what they claim to be the most perfect form of carburettor ever placed on the market. They have been testing it for the past six months and pronounce it to be suitable for any type of engine. The chief claim made for it is that it gives the correct mixture at any speed of the engine; this is effected by a jet the size of which is varied by the raising or lowering of a tapered plunger connected to an eccentric on the throttle spindle. The control is thus by means of one lever only. The adjustment of the carburettor to any engine is particularly simple, being operated by a small thumb set-screw.

A MEETING of motorists was held at Stoke-on-Trent, on Tuesday, to protest against a proposal of the Stoke-on-Trent Town Council to impose a ten-mile limit on a portion of the route from Stoke to Trentham. Mr. A. Fielding, of Trentham, complained that some users of the roads went out of their way deliberately to hamper and inconvenience the users of motor-cars. It was decided to petition the Local Government Board against the step contemplated by the Stoke Council, and a committee was appointed to wait upon the Council and endeavour to get them to withdraw their proposed action.

AT the Guildford County Bench the driver of a horse-drawn vehicle conveying petrol has been fined 40s. for cruelty to his animal.

AN agreement has just been concluded between the K ngl Automobil Club, Stockholm, and the Royal Automobile Club. This agreement is of the same character as those at present in existence between the R.A.C. and other European clubs. H.S.H. Prince Francis of Teck has been made an honorary life member of the Swedish club.

A NOVEL means of starting has been adopted in the eight-cylinder petrol engine of the petrol-electric motor-car recently built for railway service by the American Locomotive Works and the General Electric Company. The engine develops 100-h.p. at a speed of 550 revolutions per minute. For starting purposes a special breech block mechanism is provided on one of the cylinders, in which a charge of black gunpowder is fired.

THE Public Control Committee of the London County Council report the receipt of the circular letter from the L.G.B., already published in the *M.C.J.*, and add that they are giving careful consideration to the points raised, but that, from a comprehensive report that has been prepared on the subject of regulating the traffic in question, it would appear that the Council's powers are very limited in the matter, and that fresh legislation will be needed.

THE Anglo-American Oil Company, Ltd., for many years located at 22, Billiter Street, E.C., have found that their growing business in Pratt's Motor Spirit and other petroleum products necessitates much larger accommodation than that afforded by their present head offices. Accordingly an important site has been chosen at Queen Anne's Gate, Westminster, for a fine new building which will afford accommodation for the large staff connected with the distribution of the varied products of petroleum.

WE hear that the Committee of the Marine Section of the Society of Motor Manufacturers and Traders has decided not to organise a marine display in connection with the Commercial Vehicle Exhibition at Olympia in March next. Motor-boat enthusiasts will, however, be glad to learn that arrangements are in hand for the inclusion of an exhibition of all classes of motor-boats, launches, &c., in the Gilbey Hall in connection with the Cordingley Show at the Agricultural Hall, Islington, in March next.

THE Stepney Spare Motor Wheel Company, Ltd., of Llanelli, have issued an excellent catalogue for 1909, from which we learn that more than 75,000 cars have already been fitted with the speciality of the company. The new catalogue contains illustrations and descriptions of the various accessories in connection with the Stepney wheel, together with the scale of prices and instructions for fitting the same. This well-printed list is a useful work of reference, and the order form which is included will enable prospective users of the spare wheel to know exactly the information that is required in order to secure the proper size, &c.

ACCESSIBILITY is as desirable in connection with the locale of business firms in the motor trade as in the parts of a car, a fact that is recognised by the Avon India Rubber Company, Ltd., who have now become installed as tenants of 35, Long Acre, London, W.C. This is well within the "motor zone" of the West End, and the company, whose works at Melksham, Wiltshire, are on a large scale, have wisely arranged to undertake small repairs on the premises for the convenience of motorists anxious to go on their way without hindrance. The establishment has a well-equipped basement and four floors above, all the latter being devoted to show-room and warehousing purposes. The selection of motor tyres on view is fully representative of the good qualities supplied, the main points of which will be dealt with in our report of the Olympia Show. Suffice it here to write that the Avon tyres are made with round or square treaded covers, with or without non-slipping grooves across the tread. A studded non-skidded tyre is also made, and the quality of the materials used is as conspicuous as the excellence of the system of construction. Mr. Ernest Bowden is the London sales manager, and business should quickly gravitate towards 35, Long Acre, W.C.

THE OLYMPIA SHOW.

SOME NEW CARS FOR THE 1909 SEASON.

ON the 13th inst. (Friday) the Motor-Car Exhibition at Olympia opens its doors and will attract considerable attention from the motoring public until the closing day, which is the 21st inst. The appearance of the Hall has now become familiar to frequenters of automobile shows, and many stands will attract the eye of the public from their own artistic appearance as well as from the mechanical improvements exhibited thereon. In the centre of the Hall the Daimler and White Companies are prominent, and the stands of Messrs. Jarrott and Letts, the Humber Company, Messrs. Donne and Willans, Ltd., the Deasy Company, and other notable motor firms are not far away. From the North of England comes the Hollingdrake Company, Ltd., with the "La Buire" cars, and familiar names like Ford, Adams, Napier, Darracq are scattered about. On one side the Rutherford steam car is shown, and in the annexe Messrs. Galloway and Co. are also present with one of similar motive power. There, too, the Hillman-Coatalen have a stand as well as Messrs. Mann and Overtons with their Unic and Brasier vehicles. The motor body building firms are well to the fore in this section of the Exhibition.

A preliminary inspection of Olympia while preparations were in progress on Tuesday confirmed our view as to the display being very much like its predecessors, and in the Gallery many firms occupy their familiar places, such names as Dunhill, Gamage, Bleriot, Rotax, Doherty and others testifying to the continued enterprise of many of the pioneers of the motor industry. Last week we referred to many of the leading features in the cars for the new season, in our present issue the report is continued, and in the next two numbers we shall conclude our full review of the automobile industry as revealed by the present Exhibition.

The Delaunay-Belleville Cars.

Now that no less than five four-cylinder and four six-cylinder models are being turned out by the Delaunay-Belleville factory, it may safely be stated that the British sole agents, the BURLINGTON CARRIAGE Co., LTD., are in a position to cater for all classes of motorists. The

Fig. 12.—The Delaunay-Belleville 25-h.p. Six-Cylinder Engine.

four-cylinder vehicles are of respectively 10-h.p., 15-h.p., 20-h.p., 28-h.p., and 40-h.p., while the six-cylinder types are of 15-h.p., 25-h.p., 40-h.p., and 70-h.p. Devoting our attention more particularly to the new designs for 1909, these are the 10-h.p. four-cylinder and a 25-h.p. six-cylinder. One of the main features of the small car is that the four cylinders (85 mm. bore by 120 mm. stroke) are cast in one piece, even the inlet and exhaust pipes forming part of this casting, thereby reducing all water and compression joints to a minimum. The valves are all on one side, operated by a single cam-shaft driven by means of two gear wheels, which are completely enclosed in an extension of the base chamber. The cam shaft is made of a special grade

of steel, with the cams forming part of same cut out of one solid piece. The valve lifters are provided with a special spring to ensure the roller following exactly the profile of the cam. This method eliminates the major portion of the noise which is attributable to the cam shaft and valve motion. The high-tension magneto and the water circulating pump are fixed at the front of the engine and operated off a cross shaft. The magneto is made easily removable, and the water-pump can be detached without destroying the rubber joints. The cooling of the radiator surface is effected by two fans, one placed immediately behind the radiator tubes and the other situated on the periphery of the fly-wheel. The carburettor is of a special type, the jet being always visible

Fig. 13.—The 15-h.p. Six-Cylinder Delaunay-Belleville Car recently supplied by the Burlington Carriage Company, Ltd., to Mr. Arthur M. Haubury, of the London Motor Cab Company, Ltd. The vehicle is fitted with the latest "Burlington" light touring body and Rudge-Whitworth detachable wheels.

and easily accessible. The admission of gas is effected by a cylindrical slide valve, and the mixture is automatically regulated by means of a spring-loaded valve. The throttle slide valve is controlled both by hand and foot levers. Lubrication is on the well-known Delaunay-Belleville principle—that is, internally applied under pressure by means of a valveless oscillating pump. The crank shaft is formed of high tensile steel, and supported on three bearings. The engine and its component parts form a unit completely independent of the rest of the chassis. The valve timing, &c., is indicated on the periphery of the flywheel, and compression taps are fitted in the cylinder heads, these being so arranged that the position of the piston may be exactly determined at any time. The clutch is of the leather-faced cone type, fitted on the extension of the crank shaft. The pressure on the cone is by means of an enclosed spring, covered and protected by two telescopic tubes. The tension of the spring may be altered by means of a single nut, while the position of the clutch pedal can be varied to suit the driver by means of the adjustable connecting rod from the pedal to bell crank of clutch. The change-speed gear gives three speeds and reverse, with direct drive on top by means of a single sliding gear sleeve. A new method of assembling the gear wheels on the secondary shaft is now employed, by means of which all bolts, nuts, washers, &c., are dispensed with. The final transmission is by means of a propeller shaft, enclosed in a sleeve fitted at the forward end with a patent torque and shock-absorbing device. Provision is made for the oscillating movement of the back axle by the use of special bearings under the spring clips. The hand brakes on the back wheels consist of two shoes forming a circle operated by the action of a cam. The adjustment of the brakes is extremely easy, and can be carried out without removing the wheels. The foot brake is situated directly behind the gear-box. The adjustment is facilitated by means of a special method of securing the two cast iron shoes. The adjusting screw may be reached either through the floor boards or through a special opening in the mud-protecting shield. The chassis is supported on two longitudinal springs at the front and a set of three springs at the back, two longitudinal and one transverse.

Passing now to the new 25-h.p. six-cylinder car, this has been introduced to meet the demands of those motorists requiring something between the 15-h.p. and 40-h.p. models. In general arrangement it follows the usual Delaunay-Belleville lines, the patent system of lubri-

cation (internal pressure), the improved leather cone clutch, the patent system of live axle suspension and spring attachment all being incorporated. The cylinders of the engine (Fig. 12) (98 mm. bore by 122 mm. stroke) are cast in pairs. The crank shaft runs on four bearings, supported in the upper portion of the crank chamber, so that the lower half can be completely removed to allow the big ends to be readily inspected. As will be seen, the valves are all on one side, and actuated by a single cam shaft. The high-tension magneto and water pump are driven by means of shafts at right angles to the crank shaft. A half-compression device is fitted to enable the motor to be easily started. The change-speed gear gives three speeds, with direct drive on top. The front axle

Fig. 14.—The Beeston-Humber 28-h.p. Landulet.

has unbreakable forged steel ends and is of H section. The pivots are also in unbreakable steel forged from a single piece with the axle arms. Ball-bearing thrusts support the weight of the car, and all friction points are provided with bronze bearings well lubricated by oil.

The vehicles on view comprise a 10-h.p. four-cylinder, 15-h.p. and 25-h.p. six-cylinder chassis, a 15-h.p. with a limousine body, specially designed for combined town and touring use, a 28-h.p. with a landulet body, and a 40-h.p. six-cylinder finished as an open touring car. The Burlington Carriage Co., Ltd., have a long-standing reputation as carriage builders, which will be well maintained by the high-grade body work to be seen at their stand. The touring body on the 40-h.p. chassis is an entirely new departure; the panel curves, whilst bearing traces of the older type of Roi-des-Belges body, have been improved, and the sweep of the curves has been extended to embrace that part of the carriage work which formerly constituted the boot. The painting is of a soft shade of French grey, relieved with a darker shade of French grey on the mouldings, and the wings and wheels are picked out to match. A double extension Cape hood of improved design and a Banks' patent double-folding wind screen are fitted, the whole appearance of the vehicle being very striking. Another attractive body is a single landulet on the 25-h.p. chassis, the panels of which are all curved and of hand-hammered aluminium. The back seat is constructed to seat three persons comfortably; there is also an emergency seat for a fourth person, this having a back rest which folds against the door of the car and prevents the occupant falling out should the door by any chance be opened. The interior is upholstered in rich dark red leather, with silk laces to match. The painting is a beautiful shade of deep lake, relieved with black lines, and the pillars are made to fold down, thus making an absolutely open car when required. An adjustable wind screen is fitted to the dashboard, which can be set to any angle, so that the driver has a clear view even in rain or snow.

The Vinot Cars.

Messrs. T. J. HARMAN AND Co., the British agents for the Vinot cars, are showing a new model of these increasingly popular vehicles. It is of 16-h.p., and is fitted with a four-cylinder engine, 80 mm. bore by 110 mm. stroke. The ignition is by Bosch high-tension magneto, and the mixture furnished by a carburettor of the Claudel automatic type. The control of the motor is by a single lever acting on the throttle, the ignition being fixed. The Vinot patent clutch and gear box are fitted, the latter giving three speeds. The final transmission is by a propeller shaft and bevel gear to a live axle of strong design. The motor is claimed to not only be economical—the petrol consumption being 30 miles to the gallon—but extremely flexible, it being able to drive the car on top gear at any speed from 5 to 45 miles per hour. Other cars on show include a 16-h.p. suitable for doctors and town use, a 16-h.p. side-entrance car, and a 24-h.p. chassis fitted with a special body enclosing the driver.

The Humber Cars.

The consolidation of the HUMBER business in the great works at Coventry has now been satisfactorily accomplished, and its products will be inspected by both trade and public. The following is a complete list of the cars which are on view:—A six-cylinder double phaeton. A 28-h.p. landulet. This is a new type, the engine being 100 mm. bore by 150 mm. stroke; otherwise the chassis is the same as the 30-h.p. Beeston Humber. A Beeston Humber 20-h.p. standard five-seated double phaeton. A 22-h.p. double phaeton body, painted cream and carmine. This is another new model; it is fitted with a four-cylinder engine, 90 mm. bore by 140 mm. stroke. The chassis, otherwise, is similar to the 20-h.p. Beeston Humber. A 15-h.p. standard Coventry double phaeton. A 12-h.p. Coventry Humber standard car with the four cylinders cast in pairs. An 8-h.p. two-seater, a new model, and a 12-h.p. doctor's landulet with twin-cylinder engine. All 1909 cars are being provided with forced lubrication, thus giving a clear dash, while thermo-syphon cooling and detachable wheels will be fitted without extra charge. Another point which will meet with general approval is that heavier tyres are now being fitted.

Taking the models separately, the six-cylinder follows the lines which has made it so successful during 1908. The new 28-h.p. takes the place of the 30-h.p. of the past two seasons in all respects save the engine dimensions. The motors of the 22-h.p. and 28-h.p. cars give great power for their size, this having been attained by following the results of experiments carried out with the object of determining how best to fulfil the laws governing the efficiency of petrol engines. An automatic system of forced feed lubrication is fitted to the crank case, actuated by a small gear-driven pump, which obtains its supply of oil from a sump in the bottom of the crank case. The 20-h.p. Beeston Humber double phaeton follows the lines of the 1908 model, while the 15-h.p. Coventry Humber practically remains the same. Two noticeable alterations in this model are the fitting of a new carburettor and a high-tension distributor, the better

Fig. 15.—The Humber 8-h.p. Two-Cylinder Motor.

synchronisation of which adds to the power and makes the car a more pleasant one to drive. The new 8-h.p. Humber is perhaps the principal novelty, and will be viewed with interest by a large section of the public. The vehicle differs somewhat from the usual Humber practice; simplicity and accessibility are among its leading points, so that any one can handle it without special knowledge of motor-cars. The engine has two cylinders, and dual ignition is fitted. As will be seen from Fig. 15, the valves are all on the side, and the flywheel is arranged to act as a fan. The lubrication is as on the 28-h.p. and 22-h.p. cars. The crank case is filled with oil by means of a combined filter and filler which also acts as an air vent when the engine is running.

From here it is pumped to all the bearings of the motor. An oil level indicator is fitted, whereby one can tell how much oil is in the engine, and an indicator on the dashboard indicates whether the oil circulation is working or not. This model will only be made as a two-seater.

The Sheffield-Simplex Cars.

For some time past we have known that the SHEFFIELD-SIMPLEX MOTOR WORKS, LTD., had a surprise in store for the 1909 season, but were not at liberty to publish any particulars of the same. The secret is now out, however, the surprise being the production of a chassis for use in connection with open touring cars, in which the orthodox gear-box has been dispensed with, its place being taken by a two-speed gear, with reverse motion, contained in a neat and small oil-tight case at the live-axle end of the torque-resisting member, which, in the Sheffield-Simplex cars, consists of the cardan shaft casing. The departure, which is all the more interesting in that it has been achieved without in any way departing from existing and tried principles, has resulted in reducing the number of parts in the transmission by about 150, and in lessening the weight of the chassis to the extent of no less than 3 cwt. At the same time, it effects a great increase in the efficiency, 99 per cent. of the running being done on the top direct speed, lessens

Fig. 16.—View of Chassis of Sheffield-Simplex 45-h.p. Gearbox-less Car.

the first cost of the car without sacrifice of quality, and reduces the cost of maintenance. Leaving for the moment any reference to the engine and clutch, &c., which are the same as in the company's standard design, and confining our attention to the new arrangement of the change-speed gear, the neat and compact way this has been carried out will be observable from the illustrations (Fig. 16 and 17). As has already been mentioned, it is mounted in a small case surrounding the bevel pinion shaft at the rear end of the propeller shaft; details of the arrangement are given separately in Fig. 18, from which it will be noticed that the low and reverse speeds are obtained by spur pinions of the sliding type, fitted on two short subsidiary shafts. On the top speed, on which the bulk of the running is done, the usual direct drive, with a gear ratio between the engine and live axle of three to one, is obtained. The low speed, which gives a ratio of six to one, is, as a matter of fact, only brought into use for starting, for getting out of bad places, and on excessively steep hills. The new car has been thoroughly tested before being put on the market, for Mr. Percy Richardson, the managing director, informs us that the first vehicle of the improved type has been subjected to a road trial of over 5,000 miles, in which it was driven over all the different classes of roads that could be found, extending from the south of England to the north of Scotland, including the most difficult part of the Scottish Reliability Trial route—a trial

in which it proved itself capable of doing all that one with a gear-box could do, taking all ordinary hills with gradients up to one in twelve quite easily on the top speed, with an ample reserve for slowing down and picking up speed again; on the low gear climbing and re-starting on such steep hills as Amulree (which has a reputed gradient of one

Fig. 17.—Elevation and Plan of Sheffield-Simplex Six-Cylinder Car without Gear-Box.

in three and a half), and Porlock (one in four), and maintain a speed up to the legal limit. The new gearbox-less model is being supplied for open touring car work only; it has a wheel base of 10 ft. 8½ in., and is being fitted with Rudge-Whitworth detachable wheels. For use in conjunction with landaulets, limousines, and other covered bodies, the chassis with the standard type of three-speed gate-controlled gear-box is being retained, road wheels of the wooden artillery type being used on this model.

Fig. 18.—Sectional Elevation and Plan of Two-Speed Gear combined with Back Axle on the new Sheffield-Simplex Six-Cylinder Car.

Reverting now to the features which are common to both types, and dealing first with the 45-h.p. six-cylinder engine, which is the only size the company are manufacturing, it will be seen from Fig. 19 that the cylinders (4½-in. bore by 4½-in. stroke) are cast in pairs, with the valves all located at one side. The carburettor is of a special automatic type,

in which an air-tight float chamber is employed. Connection is made between the upper part of the chamber and the admission pipe, so that the suction of the engine acts both on the float chamber and the jet. In this way not only is an economy in fuel effected, but a more perfect mixture ensured. Two systems of ignition are provided, the latest type of Bosch dual magneto and coil arrangement being employed. Attention may also be drawn to the high-tension ignition wiring; the wires for the six cylinders are all moulded together in insulated material, and encased in vulcanite, an arrangement which is at once neat and practicable, obviating the danger of short circuits and the worries attendant on a number of loose wires. The water circulation is maintained by

Fig. 19.—View of Valve Side of Sheffield-Simplex 45-h.p. Six-Cylinder Engine.

a gear-driven pump of special design; it is located on the valve side of the motor, and can be easily detached. The control of the engine speed by means of a lateral-moving pedal, as introduced on the Brotherhood car, is retained. A special feature of the engine is that ball-bearings are fitted not only to the crank shaft, but also to the cam shaft—in fact, it may be said that they are used throughout the car. The clutch is of the multiple-disc type, running in oil, the pedal operating it being connected to the foot brake. The first portion of the travel of the pedal disengages the clutch, the further movement applying the brake. The whole of the cardan shaft is enclosed in a casing which fulfils all the functions of the usual torque and radius rods. The forward end of the casing terminates in a steel globe, which not only forms a shield and oil case for the joint, but allows for movement of the back axle in all directions. A support for the globular joint is carried by a cross member on the frame. The back axle is of the arched type, allowing the wheels to be played as in chain-driven vehicles. The differential casing is provided with a large detachable cover at the rear; this can be removed by undoing four bolts, so exposing the main bevel wheel and the bevel-pinion differential gear. The weight of the car is carried on the axle casing, the axle driving the road wheel hubs through dog clutches. The brakes of the Sheffield-Simplex cars are also of an interesting design. Both the foot and the hand-controlled brakes operate on concentrically-arranged drums attached to the hubs of the rear wheels, and are of the internal-expanding type. The pressed steel frame, which is quite straight, the front and rear ends being tied together by cross-bars, is supported on five springs, which are of the type introduced on the Brotherhood car—i.e., they are provided with means of lubricating each leaf. Special attention is drawn to the lubrication, an interesting form of mechanical lubricator being fitted to the dashboard. There are a series of small pumps in the lubricator, actuated by a chain-driven cam shaft, the pumps being connected to the engine, the gear-box, and to the universal joint of the cardan shaft. From the latter the oil flows through the cardan casing to the differential case, and thence along the axle to the road wheels. Although our description of the features of the Sheffield-Simplex cars has already run to great length, there are many other interesting details worthy of careful examination, the display being one which illustrates in a striking measure the great progress that has been made in British automobile design and construction in recent years.

The Darracq Cars.

Not only have the prices of Darracq cars been reduced for the 1909 season, but further improvements have been introduced in the details which should help to maintain the popularity of these vehicles. Several new types are to be seen at the stand of Messrs. A. DARRACQ AND Co., LTD., notable among which is the "Four-Inch" model, the outcome of the excellent showing made by the Darracq cars in the 1908 Tourist Trophy race. An inspection of the polished chassis shows that the four cylinders of the engine are cast in pairs, with inlet and exhaust valves on the same side. The bore is 100 mm., the stroke 120 mm. (R.A.C. rating 25.6-h.p.). Two ignition systems are available—high-tension magneto and coil and accumulator. The water circulation is maintained by a gear-driven pump and gilled tube radiator with fan. The clutch is provided with a special spring-drive device to take up the load without shocks on the transmission. The leather-faced clutch is still adhered to, the company considering that nothing simpler or better has yet been devised. A new type of gear-box is fitted, giving four forward speeds, operated through a gate quadrant. On the top speed the drive is direct. The gear shafts are carried on ball bearings of large diameter. The pressed steel frame is narrowed in front to allow a good steering-lock, and raised at the rear to allow the body to be hung very low. The chassis has been designed to take either an open or closed side-entrance body. A new model, which will appeal to those who are on the look-out for an attractive and speedy two-seated car at a moderate price, is the new 8-10-h.p. two-cylinder, in which are incorporated all the latest improvements of the larger cars. The vehicle is fitted with a two-cylinder motor (90 mm. bore by 120 mm. stroke). The ignition is by high-tension magneto, and the carburettor is of the well-known Darracq pattern, with automatic air intake. The gear-box, which provides three speeds, is controlled by a lever under the steering wheel. The gear shaft runs on ball bearings, as in all Darracq models. The steering, of the worm and sector type, is a particularly strong feature of the car, and is provided with adjustment for taking up any slackness due to wear. The front axle is of H section, and is an exact replica on a small scale of the front axles on the 25-35-h.p. and 50-h.p. models. Internal expanding brakes are provided, these being compensated and capable of action in either direction. The wheels are of the artillery pattern, fitted with 750 by 85 Dunlop grooved tyres. A polished chassis of the 14-16-h.p. four-cylinder vehicle next attracts attention. This follows the usual Darracq lines, except that the four cylinders are cast *en bloc*, the dimensions being 85 mm. bore by 100 mm. stroke (R.A.C. rating 18-h.p.). High-tension magneto ignition is fitted as the standard, but a secondary ignition can be provided at a slight extra cost. The gear-box has three speeds forward, the top speed being direct. The transmission is by cardan shaft, with a special universal joint at each end. The back

Fig. 20.—The Darracq 1909 14-16-h.p. Car.

axle runs on large double-cage ball-races. The clean design and the absence of unnecessary parts is particularly noticeable in this chassis. The 25-35-h.p. Darracq, owing to the satisfaction which it has given during the past season, has not been materially altered for 1909. The engine (120 mm. bore by 120 mm. stroke) remains the same, and the four-speed gear-box, with gate control, has not been modified. Many improvements have, however, been added, among which may be mentioned a new automatic lubricator positively driven by a connecting rod from the cam shaft, and the adoption of three-quarter elliptic

springs for the rear suspension. With regard to body work, all the cars except the 8-10-h.p. two-cylinders can now be provided by English-built bodies, those on view including a 25-35-h.p. limousine, a 14-16-h.p. side entrance double phaeton (Fig. 20), and a "Four-Inch" touring car.

Messrs. J. Keele, Ltd.

Messrs. J. KEELE, LTD., 72, New Bond Street, W., are showing one of the new 14-16-h.p. Belsize cars, in which a number of improvements on the 1908 model have been effected, notably longer bonnets,

Fig. 21.—The Belsize 14-16 h.p. Car.

larger radiators, improved front wheel bearings and back springs. Among the complete cars are a standard side-entrance double phaeton, a landaulet, a two-seater, built low, with the petrol tank behind the seats, and a side-entrance car, the back half being detachable, enabling a sloping tool box to be fitted in its place. Messrs. Keele are also exhibiting three 1909 Darracq cars, including one of the "Four-Inch" touring models, one of the new 14-16-h.p. four-cylinder vehicles, and one of the 1909 10-12-h.p. type. We may add that Messrs. Keele are the London wholesale and retail agents for the Belsize and Darracq cars.

The S.C.A.T. Cars.

Examples of high-grade Italian automobile construction are to be found in the S.C.A.T. cars, exhibited by Messrs. NEWTON AND BENNETT, LTD., Manchester. The new models are the 14-h.p. and the 22-h.p. (four-inch). The engine (Fig. 22) of the smaller car is 85 mm. bore by 120 mm. stroke, while the dimensions of the 22-h.p. have been increased from 100 mm. by 120 mm. to 101½ mm. by 140 mm., larger inlet and exhaust valves being also employed. Among the changes that have been effected one of the most important is in connection with the lubrication of the engine. This is now effected by a rotary pump mounted on the rear end of the exhaust camshaft, which forces the oil to all the bearings of the engine, and along the hollow crankshaft, up the connecting rods to the gudgeon pins and cylinder walls. The pump is so arranged that any special gear drive is dispensed with,

Fig. 22.—The S.C.A.T. 14-h.p. Motor.

and that it may be instantly dismantled from above. The clutch is of the multiple disc type, the steel discs having a broad surface. A universal detachable coupling on the shaft enables the clutch to be completely dismantled without disturbing the gear-box. The latter is adapted to give four speeds, and is operated by a gate lever. The whole of the striking gear is placed inside the gear-box, the locking device being accessible from the outside. Large ball bearings are fitted throughout, while the gear wheels slide on castellated shafts. An improved form of irreversible worm and wheel steering gear has been

adopted, the feature of which is that not only is the entire mechanism enclosed and working in grease, but it may also be removed from the chassis by taking out a few bolts and without disturbing any other part. Attention may also be directed to the S.C.A.T. self-starting device, which is on view. The arrangement, which is the invention of Mr. R. O. Harper, the firm's works manager, consists of a neat air-cooled pump, driven off the crankshaft by a ball bearing eccentric, and maintaining a supply of air under pressure in a reservoir, whence it can be delivered to the engine as desired. The self-starter proper comprises a casting mounted over the valve caps replacing the usual yoke pieces and retained by two nuts only. This casting contains a rotary valve drilled with air holes for the passage of the air to the cylinders for starting. The control is by a pedal conveniently situated beside the clutch pedal, so that it is always possible to start the engine from the driver's seat. The pump may also be used for inflating the tyres, a coil of flexible tube with gauge being supplied for this purpose.

The Crossley Cars.

Messrs. JARROTT AND LETTS, LTD., have, as usual, an interesting display of the Crossley cars, which are now being built in a spacious new factory that has been erected close to the Crossley Gas Engine

Fig. 23.—General View and Details of New Crossley Carburettor.

Works in Manchester, and equipped with the latest machinery. While the design of the well-known 40-h.p. model is, generally speaking, similar to that of this year, a number of modifications in the details have been made. One important difference is a material reduction in the selling price of the chassis, which has been rendered possible by the facilities afforded by the new factory. As regards the constructional features of the car, these include low-tension magneto ignition, metal-to-metal clutch, expanding inside the flywheel, live axle, and direct drive on the top gear. The carburettor is of an entirely new design, which has been adopted after twelve months' trial, and which is situated in a novel place at the top of the induction pipe. The new device, which is illustrated in Fig. 23, is entirely automatic and controlled by one throttle lever. The throttle, which is of tubular design, and thus unaffected by the engine suction, works vertically in a chamber which is well water-jacketed. The float chamber A is of large proportions and of the usual type, with needle valve spindle mounted vertically and controlled by a free copper float C through small levers. The petrol is supplied through a single orifice jet D. Vertically mounted in the latter is a finely-tapered needle E, by the raising or lowering of which the size of the jet hole is increased or

diminished. A small lever F communicates the movement of the air dash-pot valve to this needle. The action of the suction of the engine on the carburettor is to draw down the air valve against a spring which is steadied by a dash-pot arrangement. As the valve is drawn down the air ports H are opened, and at the same time the taper needle is lifted up in the jet. Thus more air and more petrol are proportionately delivered and a correct mixture ensured at all suction pressures. The immediate response of the engine to any movement of the throttle is claimed to be a very noticeable and valuable feature. Petrol is not wasted, yet on the other hand is not stinted, and the maximum power of the engine is always available, while the mixture is so nicely supplied that the motor can be kept running dead slow when the car is standing. An extra air device is provided, so that although the carburettor is automatic a supply of extra air can be admitted under control of the driver by simply opening the throttle to its fullest position. The action of this is to raise a taper plug I, which moves with the throttle spindle in a hole centrally below the throttle in the induction pipe. The hole is thus gradually enlarged and more or less extra air admitted. By this means the driver can always obtain the best or most economical mixture, whatever the state of the weather, the altitude, or the quality of petrol in the tank, and thus have the engine working under the most favour-

The Bentall Cars.

The Bentall cars, made by Messrs. E. H. BENTALL AND CO., of Heybridge, Maldon, Essex, are staged in two types, the 11-h.p. having two cylinders and the 16-h.p. with four cylinders, the first mentioned being shown fitted with a touring body, having a detachable top. The 16-h.p. is exhibited both as a chassis and with three types of bodies, one being a landaulet, one a two-seater, and the others side-entry touring cars. In main features of design but little alteration has been made from the 1908 models. The low-tension magneto form of ignition is retained, the makers claiming that the Bentalls are the lowest-priced high-grade cars fitted with this system on the market, and that there are less complications in it, and that fewer adjustments are necessary than in the high-tension magneto or accumulator system. The clutch, which is of the internal-cone type, faced with hard fibre running in oil, is claimed to constitute a clutch soft in action, even if carelessly oiled, of ample gripping power, and yet never fierce. It is dustproof, and fitted with Hoffmann ball bearings, which take the thrusts on all points. A feature of the change-speed gear control is the sliding lever and ratchet gate. The side-plates of the gate open out against a spring action in response to a side pressure on the lever, and when so pressed the latter can be moved only one speed at a time, so that it is impossible

Fig. 24—Chassis of the new Crossley 20-25-h.p. Car.

able circumstances. A special point about the design of the Crossley cars is the individuality of the component parts. Each main component of the chassis, such as the engine, clutch, gear-box, or rear axle, can be dismantled or replaced without in any way disturbing the adjacent parts. As an illustration of this it may be mentioned that the gears can be removed from the chassis without taking down the gear-box, and the main bevel wheels and back axle can be dismantled without removing the casing. This feature is of great advantage to both manufacturer and user, for it means much saving in time and money when repairs are required. In addition to the 40-h.p. Crossley a new live-axle model of 20-25-h.p. is being introduced for the coming season. The engine has the four cylinders cast in pairs, with large water jackets, the bore and stroke being 4 in. by 5 in. On this model high-tension magneto is adopted, and provision is made for fitting a forced feed system of lubrication, if desired, at a small extra cost. The carburettor is of Messrs. Crossley's own design on the Gillett-Lehmann principle, a description of which was given in a recent issue. The clutch is of the Crossley expanding metal-to-metal type. The change-speed gear is adapted to give four speeds with a direct drive on the top, the gears being actuated by a lever working in a "gate" sector. The exhibit comprises a 40-h.p. show-finished chassis, a 40-h.p. with elegant limousine body and a chassis of the new 20-25-h.p. car.

to unintentionally overrun the gear desired. Another speciality of the design of the Bentall cars is that the gear-box and back axle are rigidly coupled together by means of radius-rods. The gear-box has at its front end a stout steel tube, which rests in a trunnion ring, the trunnions being supported in bearings attached to one of the transverse members of the main frame. This allows both members considerable freedom of movement; it is the only point at which the gear-box is attached to the main frame, the other end being supported by the radius-rods, which are bolted to its sides, and pass back to the rear axle, where they terminate in sockets provided for that purpose. There is also a tubular casing over the propeller-shaft, flanged at each end, and bolted both to the gear-box and back-axle casing, which materially increases the rigidity of the whole design. The foot and hand brakes are all centred on drums connected with the hubs of the rear road wheels.

The Bell Cars.

Messrs. BELL BROTHERS, Ravensthorpe, Yorks, display examples of their 16-h.p. and 20-h.p. vehicles, including one with a two-seated runabout body. So far as regards the details, these are very much on the lines of the 1908 models, the improvements being confined to small matters. A clutch of the multiple disc type is now employed, while a universal joint has been introduced on the shaft between the motor and the gear-box.

The Buick Cars.

BUICK MOTORS, of Great Marlborough Street, are displaying three Buick 15-20-h.p. cars, these comprising a chassis; a standard three-seater, two bucket seats in the front, with detachable seat at the back; and a new model fitted with a smart double phaeton body, capable of comfortably seating four passengers. The engine in the Buick vehicles is of the four-cylinder vertical type with overhead valves, the cylinders, which are cast in pairs, having a bore of $3\frac{1}{2}$ in. and a stroke of $3\frac{1}{2}$ in. The control of the motor is by two levers conveniently placed on the steering wheel. The clutch is of the cone pattern, while the change-speed gear is of the epicyclic or planetary

Fig. 25.—The Buick 15-20-h.p. Four-Seater Car.

type, giving a direct drive on the top gear to the live axle. The 1909 modifications include the provision of magneto in addition to coil and accumulator ignition, an increase in the length of the wheelbase, and the fitting of larger-sized tyres. A special point of interest to be noticed on the Buick cars is the accessibility of all the working parts, enabling adjustments to be made with the least possible trouble.

The Swift Cars.

THE SWIFT MOTOR CO., LTD., Coventry, are exhibiting three different types—10-12-h.p. two-cylinder and 15-18-h.p. and 18-24-h.p. four-cylinder. They are all fitted with coil and accumulator ignition, leather-faced cone clutch, three-speed gear-box, direct drive on top, and transmission by cardan shaft and bevel gear to a live axle. The latter has only the driving effort to withstand, the weight of the car being taken by the axle-casing on which the rear road wheels are mounted. The bore and stroke of the various engines are 10-12-h.p., 102 mm. by 111 mm.; 15-18-h.p., 85 mm. by 102 mm.; and 18-24-h.p., 102 mm. by 111 mm. Several improvements have been effected in the 10-12-h.p. two-seater car. The radiator is of a new type, having flat tubes, while retaining the appearance of the honeycomb pattern. The motor has been re-designed, with the view of increasing the accessibility of the valves, there being now nothing in front of them. A platform is also provided for quickly fitting gear-driven magneto when required. The universal joints of the cardan shaft are of the same type as in the 1908 type 18-24-h.p. Swift, and are neatly enclosed in dust-proof grease-retaining metal cases. A spring drive is now employed instead of radius rods as before. The wheelbase of this chassis is now 7 ft., and the springs have been lengthened. The clutch, while of the same type as hitherto, has been altered in detail so as to be a little more accessible. The "gate" type of change-speed gear control is retained, but the lever and actuating tackle have been altered from a sliding to a rocking movement. The 15-18-h.p. is an entirely new model. The four cylinders of the motor are cast in pairs; large valves are fitted, while the crank shaft, which is supported in the top half of the base chamber, is slightly *desaxé*—that is, slightly out of line with the centre of the cylinders. A gear-driven pump ensures a steady supply of oil to all parts of the engine. The gate-controlled gear-box gives three speeds, with a direct drive on top to the live axle, which runs on ball bearings.

The Dennis Cars.

Considerable interest is being taken in the new popular priced 18-h.p. (R.A.C. rating) car, which is being shown by Messrs. DENNIS BROS., LTD., who have introduced it to meet the growing demand for a car of reasonable horse-power and with an inexpensive upkeep. The complete vehicle weighs less than one ton, and is fitted with a body capable of carrying four persons. The engine is of the four-cylinder type, and is fitted with magneto ignition. The gate-controlled gear-box gives four speeds, with direct drive on the third and geared up fourth speed. The back axle is of the well-known worm-gear driven type, and the road wheels are of similar construction to the larger model, but made lighter—in fact, the whole machine is built to meet

the requirements of a light and yet strongly-constructed vehicle. The frame is made raised towards the back and brought low in the centre to facilitate entrance. Another new model is seen in a 40-h.p. car, of which a polished chassis is displayed. It is fitted with a four-cylinder engine (127 mm. bore by 130 mm. stroke), which by the formulae recommended by the S.M.M. gives 47.3-h.p. The lubrication is effected by a geared pump located in a sump cast in the base chamber. The oil, which is forced under pressure to all the bearings, is supplied from a tank placed in a convenient position on the exhaust side of the motor. The water circulation is maintained by a centrifugal pump fitted on a bed cast with the crank case and in direct mesh with the timing wheels, which are cased in and run in oil. The pump driving wheel has a bearing on each side, as has also the high-tension magneto, both being driven direct off the timing wheels. All the half-time pinions are made of metal throughout, and so cannot under any conditions swell or become untrue. The commutator or high-tension distributor is mounted on the upper end of a spindle driven from a spiral gear fitted on the half-time shaft, which makes it particularly accessible, and with this high-tension distributor practically three systems of ignition are available—one being magneto, another electric, using the magneto as a distributor, and a third using the high-tension distributor and independent synchronised trembler coil and accumulators. The clutch is of the leather-faced cone type, the dogs for releasing it being encased in a grease-tight metal casing. A loose joint is provided between the clutch and gear-box, the latter being gate-controlled and of the four-speed variety, giving a direct drive on the third speed and geared up fourth speed. A very important feature is the free-wheel gear-box, which allows the gear to be changed at any speed at which the car may be travelling without having to wait until it slows down to the speed corresponding to the gear. This improvement is brought about by introducing a free-wheel clutch, which allows the engine to drive the gears, although the latter cannot drive the motor except on the third and direct drive when the engine is coupled up direct, with no gears in mesh, to the back axle. The cardan shaft, which is parallel with the ground, meshes through a square joint with the worm pinion. The latter is supported on compound ball bearings at the rear and single journal bearings at the forward end. The worm wheel is made of phosphor bronze and the pinion of hardened steel. The live axle has merely to transmit the drive, as the weight of the vehicle is supported on the sleeve inside which the axle revolves. The road wheels are fitted with

Fig. 26.—The Dennis 35-55-h.p. Limousine.

The body is painted in dark blue with black mouldings and fine white lines. The interior, which has accommodation for five persons, is trimmed in drab cloth; the back seats are adjustable to any width required.

staggered spokes and each revolve on four rows of ball bearings. The other cars on view to which the above specification applies, with the exception of the engine, which has a bore of 120 mm. by 130 mm. stroke, include a 35-h.p. landaulet, which is made to entirely fold down, with a detachable front over the driver; a 35-h.p. limousine, fitted with the Dennis patent extending rear seats, electric light, driver's communicator, glove rack, &c.; a 35-h.p. touring car, with low and light-constructed body and Cape cart hood of a neatly-folding design; and a 35-h.p. vehicle fitted with Ideal body, which includes leather folding hood entirely covering the back seats and meeting the requirements of a closed carriage.

The Singer Cars.

For the 1909 season the SINGER MOTOR CO., LTD., Coventry, are building three sizes of cars—viz., 12-14-h.p., 16-h.p., and 20-25-h.p. vehicles, examples of all of which are on view. The 12-14-h.p. car (Fig. 27) is of the type which did so well in the 2,000 mile trial, only a few detail alterations having been made. The engine comprises four cylinders, 80 mm. by 90 mm. bore. A high-tension magneto is now being fitted, in addition to coil and accumulator ignition, while the method of lubrication has been improved. The gate-controlled gear-box gives three speeds, the top one being a direct drive to the rear axle. The car can also be provided with four speeds, with the direct drive on the third. The 16-h.p. is an entirely new model. The engine comprises four cylinders, cast in pairs, 85 mm. bore by 110 mm.

Fig. 27.—The Singer 12-14-h.p. Side-Entrance Car.

stroke; two ignitions—magneto and accumulator—are fitted, while the lubrication is effected by a small pump located in the base chamber. As regards the water circulation, this is on the thermo-siphon system, the pump having been dispensed with. The gear-box is adapted to give four speeds, the direct drive being on the third. Another new departure in Singer practice is in the brakes, which are all now centred in the rear wheels. The front axle is a solid forging of H section. The wheelbase of the chassis is 8 ft. 6 in., enabling a roomy side-entrance body to be fitted. The 20-25-h.p. car, which may be regarded as the Singer "Four-Inch" model, remains very much on the lines of the 1908 type. The bore and stroke of the four-cylinder engine are 100 mm. by 110 mm. Two ignitions are provided. As in the 16-h.p. vehicle, the direct drive of the four-speed gear-box is on the third and not on the top speed. The "gate" lever is of an improved rocking, self-centring type. Both the foot and hand brakes work on drums connected with the hubs of the rear wheels, the drums being arranged

20-h.p. Vauxhall chassis is given in Fig. 29, from which an idea of the "clean" and pleasing lines of the design will be obtained. In the first place, it may be mentioned that the four cylinders of the engine (3½-in. bore by 4½-in. stroke) are now cast in one piece, and that the thermo-siphon system of water circulation has been adopted. The valves are all located on the left side of the motor, and operated off a single cam shaft, the tappets and valve stems being enclosed, with the view of

Fig. 28.—View of the Vauxhall Gear-Box.

increasing the quiet running of the motor. The cam shaft is driven by silent, enclosed spur-gearing, the front cross-member of the frame being dropped so that the cam shaft, complete with bearings and half-time wheels, may be withdrawn for purposes of adjustment or timing. A feature of the Vauxhall design is the lubrication of the engine, which is so arranged that all smoky exhaust due to too much oil is obviated. At the rear of the crank case cover is a sump from which the oil is drawn by means of a cam-actuated plunger pump, and forced under pressure into the main bearings, and through the hollow crank-shaft into the big-end bearings. The ignition is by Bosch high-tension magneto, the point of firing being fixed, while the mixture is furnished by a carburettor of the automatic type, the throttle of which is entirely controlled by a pedal. The power is transmitted through a metal-to-metal cone clutch, running in oil, and so arranged that it can be dismantled without disturbing either the engine or gear-box. The latter is gate controlled, and is adapted to give four speeds with direct drive on top. The teeth of the

Fig. 29.—Chassis of Vauxhall 20-h.p. Car.

concentrically. The frame, which is supported on three-quarter elliptical springs at the rear, is narrowed at the front to increase the lock of the steering wheels, and raised at the back to give clearance for the differential casing. The wheelbase of the chassis is 9 ft. 9 in., so that it is well adapted to receive large limousine or landaulet bodies.

The Vauxhall Cars.

Among the cars which have come to the front during the past season owing to their excellent performance in open competitions and in the 2,000 miles trial are those of VAUXHALL MOTORS, LTD. The vehicles on view include a 20-h.p. polished chassis, a 20-h.p. with double landaulet body, a 20-h.p. five-seated touring car, and a 16-h.p. two-seater with semi-racing type body. An elevation of the latest

gear-wheels are of ample width, and the wheels themselves of large diameter. The shafts are of nickel steel, as short as possible, to eliminate all springing, and are supported on ball bearings. Packing glands are fitted to make the shafts perfectly oil-tight. The gear-box itself is fixed by three bolts to the underframe, giving it a three-point suspension. The final drive is by a cardan shaft—having universal joints at both ends—and bevel gear to a live axle. The differential gear, which is of the spur-pinion type, is enclosed in a stout casing, from each end of which project two steel-tapered tubes, upon which the rear road wheels are supported. Squares are formed on the ends of the internal rotating shafts, which fit into corresponding squares in the hubs, so driving the back wheels. The bevel pinion can readily be removed by swinging the propeller shaft clear, and removing four nuts on the front

of the casing. It is supported by two large ball-bearings, which render any spring in the pinion shaft impossible. The chassis is made in two lengths—one having a wheel base of 9 ft. 7 in. and the other 10 ft. 3 in., the wheel track in both cases being 4 ft. 6 in. The 16-h.p. car, which is a new model for the 1909 season, is, in general design, similar to the 20-h.p. above described. The engine dimensions are 3½-in. bore by 4-in. stroke; the gear-box gives three forward speeds, while the wheel base is 8 ft. 9 in.

The Talbot Cars.

Four different models of the well-known Talbot cars are on view on the stand of CLEMENT-TALBOT, LTD.—viz., 12-h.p., 15-h.p., 25-h.p., and 35-h.p. These are all equipped with four-cylinder engines, a new

Fig. 30.—View of Engine of Talbot 12-h.p. Car.

feature of which is the fitting of a simple arrangement for rendering them practically noiseless. Although Talbot motors have never been at any time considered noisy, nothing but a faint purr can now be heard when the engine is running, and this only from the half-time gear-wheels which drive the cam shafts, pump, and magneto. It must be pointed out, however, that the silencing of the engine is done without in any way detracting from its power, or, indeed, affecting its working in any way. Dealing with the chassis in the order mentioned above, the engine of the new 12-h.p. car has a bore of 80 mm. by 120 mm. stroke, which, according to the R.A.C. rating, gives 15.8-h.p. The cylinders are cast in pairs; both inlet and exhaust valves are on the left side, and are operated from one cam shaft. The carburetor is on the right, and is of the usual Talbot type, automatically adjusting the quality and quantity of the mixture according to the speed and suction of the engine. The ignition is by high-tension magneto, supplemented with accumulators, being operated off the same distributor and controlled by a lever on the steering wheel. The magneto is placed forward of the engine in a very accessible position, and may be readily dismantled by undoing two nuts. An accelerator pedal is fitted in addition to the usual hand throttle control. The oil for lubricating the engine is circulated by means of a gear-driven pump, forced through sight feeds on the dashboard to the three main bearings and to a pipe which conveys the oil to troughs formed in the base chamber, one under each connecting rod. The big ends of the latter are provided with scoops which gather the oil from the troughs and lubricate the big end bearings, at the same time throwing oil on to the cylinder walls and gudgeon pins. Any excess of oil overflows into the sump below the troughs, and is filtered and conveyed to the pump again. The water circulation is by means of a centrifugal pump driven by a cross shaft from the half-time gear. The clutch is of the self-contained, leather-faced cone type, six springs being inserted under the leather surface to ensure easy engagement. The gate-controlled gear-box gives four speeds forward, with direct drive on top speed. All the gear shafts run on ball bearings. The propeller shaft is enclosed in a tube or sleeve, which acts as a torque rod, it being rigidly bolted to the rear axle casing. The back axle is enclosed in sleeves, which take the weight of the car and also carry the road wheels, so that the axles themselves have only to transmit the drive. Ball bearings and ball thrust bearings

are fitted to all parts where necessary. The 15-h.p. car is similar in nearly all respects to the 1908 type, this having proved itself both efficient and reliable. The engine cylinders are, however, now cast in pairs instead of separately as hitherto, and an accelerator pedal interconnected with the hand throttle control is fitted as standard. The following details will briefly describe this model:—Bore and stroke, 90 mm. by 117 mm., four-cylinder engine, cylinders cast in pairs, dual ignition—Bosch high-tension magneto and coil and accumulators working through a common distributor. Lubrication is by exhaust pressure. Four-speed gear-box, direct drive on top. The 25-h.p. Talbot (105 mm. bore by 120 mm. stroke) is similar in all respects to the 1908 type save for the addition of an accelerator pedal interconnected with the hand throttle control. Another feature of this model is the fitting, when required, of a new disconnecting clutch. The operation of the latter is as follows:—Internal teeth are cut in the clutch sleeve and corresponding teeth are mounted on the gear-box shaft. When declutching these teeth are disengaged, and consequently no effort or effect is transmitted to the gear-box shaft by the spinning clutch. This attachment renders gear-changing an exceedingly simple operation, and makes it practically impossible to scrape the gear wheels. In the 35-h.p. car the general construction of the chassis remains unchanged. There are, however, one or two modifications of minor importance, among which may be mentioned wider springs to the front wheels and bow type of front axle. Instead of the jaw for pivoting the front wheel spindle to the axle being formed on the end of the main front axle forging as hitherto, it is now on the pivoting end of the axle which carries the road wheels. A slight alteration has also been made in the bearings of the front wheels. On the inner side of each wheel there is a double row of ball bearings, which arrangement is particularly well adapted for resisting heavy thrusts as well as taking the load. On the outer side of the wheel a single row of ball bearings is fitted. The live axle casing has been slightly altered in shape, and now increases in diameter towards the differential casing—an improvement which aims at increased strength. Each of the rear road wheels runs on two double rows of ball bearings, and additional thrust bearings have been fitted to the differential to relieve the ball bearings, on which the inner ends of the live axle run, from side thrusts. Altogether the live axle now runs on eight rows of ball bearings, which renders it exceptionally strong and steady running. Other details of the chassis are as follows:—Dual ignition—Bosch high-tension magneto and coil and accumulator, both systems working through entirely separate distributors. Lubrication is by force pump in the base-chamber forcing the oil through sight feeds on dashboard to main bearings of engine, which are drilled

Fig. 31.—The Talbot 15-h.p. Car with Standard Side-entrance Body.

through, as is also the crank-shaft. The crank pins are also drilled, thus lubricating under pressure the big end bearings of the connecting rods. An oil-tank is also provided in the usual position on the chassis, to which a bye-pass from the exhaust is connected and oil is forced up through the sight feeds on the dashboard; this can, however, be shut off at will, and is quite independent of the force pump feed. An extra hand pump is also provided.

ACCESSORIES AT THE SHOW.

Brown Brothers' Specialities.

The central feature of the automobile accessories section of the exhibit of Messrs. BROWN BROTHERS, 22-32, Great Eastern Street, London, E.C., is the Autoclipse lamp, which has so recently been illustrated and described in these columns that further details are unnecessary on the present occasion. In view, however, of Parliamentary inquiries concerning the dazzling lights on motor-cars, motorists should examine its features for themselves. The Gabriel horn, actuated by the exhaust, is also shown, as well as the new "Raybestos" brake lining, composed of asbestos woven with brass wire, and now employed by most of the leading motor-car companies. A full range of the well-known "Duco" specialities completes the very complete exhibit of this well-known house.

The Renold Chain.

Messrs. HANS RENOLD, LTD., of the Progress Works, Manchester, are showing their three main types of driving chains, viz., silent chains, with pitches $\frac{1}{2}$ in. to $1\frac{1}{4}$ in., and with breaking loads of 2,000 lbs. to 87,580 lbs., for high speed driving; roller chains for medium speeds, with pitches $\frac{1}{2}$ in. to 5 in., and breaking loads of 1,750 lbs. to 86,000 lbs.; and block chains for slow speeds. The silent chains are of the improved type with the recently introduced patent bearing, which doubles the life of the chains. They include the size so largely used on London motor-buses, and others which are being adopted for the final drives on motor-cars, as illustrated in Fig. 32. Among the roller chains are all the sizes used on the fifty different makes of motor

Fig. 32.

vehicles to which Renold chains are fitted. A complete drive of each type of chain is shown, with sprockets, including an example of the spring cushion sprocket supplied for general driving purposes when the load is impulsive. Part of its cover is cut away to show the construction.

C.M.F. Radiators, &c.

At the stand of the COVENTRY MOTOR FITTINGS COMPANY, of Far Gosford Street, Coventry, is a comprehensive selection of the manufactures of this well-known firm, whose productions are of the highest class. A special display is made showing the latest methods of construction in radiators of the genuine honeycomb type, as well as of the horizontal and vertical gilled type and C.M.F. patent honeycomb gilled pattern. Petrol tanks, bonnets, silencers, under sheets, wings and oil tanks, most of which have been made to the order of well-known manufacturers, are also on view, as well as many varieties of lubricators, filters, pressure gauges, valves, and other brass fittings made for the trade in that special department of the establishment of the Coventry Motor Fittings Company.

Dunlop Tyres.

The DUNLOP TYRE COMPANY's exhibit includes the well-known grooved tyres, such as were used by Resta when he made the record at Brooklands. There are also shown at their stand the Dunlop steel-studded tyres, similar to those on the Hutton car which won the Four-Inch race; the Dunlop detachable rim, which is extremely light and neat in appearance; as well as a selection of Dunlop inside and outside gaiters, improved security bolts, valves, spare tyre covers, tube bags, rim paint, inflators, tyre testers, tyre levers, and tyre manipulators.

The Lee-Trigwell Skidless Band.

On the stand of Messrs. A. W. GAMAGE is being shown by the Automobile Contract Company, Ltd., of 51, Conduit Street, London, W., the Lee-Trigwell patent detachable skidless band and tyre protector, illustrated in Fig. 33. From a preliminary demonstration of the merits of this device we anticipate it will prove one of the most decided novelties in the Gallery. As will be seen, the band is of the familiar kind, and is made from specially-prepared chrome leather. The tread

Fig. 33.—The Lee-Trigwell Detachable Skidless Band.

is composed of toughened leather, in which are riveted hard steel studs, easily renewable should occasion require. The unique feature of the device consists in the method of attaching and fixing the band, which can be done quickly and without interfering with the cover of the tyre. When fixed there is a notable absence of creeping, and the Lee-Trigwell band will really help the preservation of the tyre. In Fig. 33 C is one of the hooks, which are placed, as will be seen, at regular intervals, and riveted on each side of the band. They pass round the outside of the lip of the endless metal rim A, and after passing below the lip, turn outwards to receive endless rings, to which they are attached. The rings being thus brought into the proper position, the adjustable clips

Fig. 34.—Section of Tyre Rim and Wheel Felloe, showing Adjustable Clip.

shown at B are placed over them, and a secure fastening obtained, which is quite independent of the tyre. This is performed by a screwdriver, the only tool required, as will be seen in Fig. 34, which shows the adjustable clip B. It should be noted that when the tyre is inflated the edge of the leather band is drawn inwards tightly, and a perfectly safe fitting is ensured. The method of detachment is so simple, easy, and

rapid that any moisture which may get between the cover and the band can be sponged clean without more than a few minutes' delay—a point of value in estimating the life of a cover. This facility of detachment is an important feature, and we anticipate much will be heard of the Lee-Trigwell band during the coming season. The band can be fitted with new studs when required, and the Automobile Contract Company, Ltd., have evidently given the device much careful study. It is a matter of interest to recall that the names now associated with this excellent band were also identified with an original patent for non-skid bands taken out in 1892.

The Avon Tyres.

The AVON INDIA RUBBER COMPANY, LTD., who have now a London office at 35, Long Acre, W.C., are represented by a display of their motor tyres, and a full demonstration of their ability in the direction of meeting the requirements of owners of cars. Three types are exhibited—viz., those with round-tread covers, square-tread covers, and studded non-skid covers. The two former patterns are constructed with and without the non-slipping cross-grooves cut right across the tread of the tyre. These Avon tyres have proved their imperviousness to puncture, and their good quality in that respect is universally recognised. The excellence of the rubber employed and the fact that the treads are moulded and vulcanised to the tyres under hydraulic pressure secure a really high-grade tyre. With regard to the Avon non-skids, which should be carefully scrutinised by those interested in their safe passage through the streets, we may mention that the steel studs are of extreme hardness, produced by a new process, and are securely riveted into a tread of rubber and fabric, which is vulcanised to the tyre casing under steam pressure. The protecting band is placed between the base of the studs and the casing, well securing the latter from any risk of injury. The Avon India Rubber Company's works at Melksham are replete with modern appliances, as is evident from their exhibit at Olympia.

Harding's Varnish Revivers, &c.

Messrs. A. T. HARDING AND COMPANY, LTD., of Stepney, London, E., have a display of their utilitarian specialities, such as varnish revivers for motor-car bodies, patent leather splashboards, and varnished goods of every description. This, too, will effectually remove mud marks and enable the work to be polished and restored to its original degree. The firm are also showing their "Blackall" varnish for touching up the iron and wood work of motor-cars as well as their "Stainless" preparation for removing dirt and grease from the lining of cars and for the cleaning of Cape cart hoods, cloth, twills, &c. All these specialities are distinguished in the trade by the mark of the "fish and the ring brand."

The H. F. Vulcanizers.

Motorists will, of course, visit the vulcanizing display in the gallery of which Messrs. HARVEY FROST AND COMPANY (39, Great Eastern Street, London, E.C.) are organisers. It will there be seen that no drastic changes have been made in the standard H.F. devices, but that the careful regard to maintain the premier position which Messrs. Harvey Frost have always shown is again proved by the many little improvements which have been made in their vulcanizers. Thus the "Baby" vulcanizer is now fitted with a burner of larger capacity than formerly; the "Car" vulcanizer has both sides flat instead of one being concave, while it is also supplied with detachable faces to fit all types of tyres; and the re-treading plants are now provided with re-designed burners which require less gas than heretofore, thus securing economy with efficiency. At the firm's stand is also exhibited the H.F. heat localizer, by means of which the heat is absolutely restricted to the repair itself. A new device is seen in the tube tester, consisting of a net attached to two rims. The tube to be tested is then placed within the net and the two rims are clipped together. The tube can then be blown up to 110 lbs. per square inch pressure without risk of injury and immersed in a specially designed and constructed water bath. With regard to other specialities of the firm, whose members have raised the art of vulcanizing to a very high degree of excellence, we may mention that the Standard A vulcanizer remains as before, as does the "Garage" equipment, which has been found to so well meet the requirements of garage proprietors that no improvement has been suggested. Vulcanising materials, canvas moulds for use with the H.F. retreader plants, and tools are all on view, as well as the H.F. wet proof paint for treating slight defects in covers in cases of emergency and in the absence of a vulcanizer.

Smith's Speed Indicators.

Messrs. S. SMITH AND SON, LTD., 9, Strand, W.C., are well known in connection with their speed indicators, which have saved many of their users considerable fines in police courts. At the Show they are demonstrating three methods of drive on a small chassis, so that intending purchasers can see for themselves the advantages claimed for each system. We illustrate the friction and the belt drive from the cardan

Fig. 35.—Smith's Speed Indicator Without Mileage Recorder.

shaft respectively, which are the methods recommended by Messrs. Messrs. Smith and Son. In the latter the belt drives from a split pulley on the cardan shaft. Among the specialities is a Speed Indicator, new dashboard milometer. Recently, when emphasising the advice of Prince Francis of Teck to motorists to adopt speed indicators, we illustrated several excellent devices brought out by this firm, so that their features are well known to our readers. At the Show some of the improvements we then noted are observable, notably the introduction of a Trip Recorder into the Popular Indicator and the fitting of a locked maximum hand into other instruments without extra cost. Their type 13 has been improved by the addition of a furlong scale round the mileage dial and the arrangement of that type in com-

Fig. 36.—Friction Drive for Smith's Speedometer.

Fig. 37.—Belt Drive from the Cardan Shaft.

bination with a watch or watch and communicator. Messrs. Smith and Son regard their "Perfect" speed indicator as having greatly influenced the award of a Diploma of Honour to the firm in connection with the Franco-British exhibit. These instruments are made to the greatest nicety of adjustment, and can be relied upon for accuracy as well as durability. Not only is this the case with the higher-priced indicators, but equal precision and excellence are incorporated into those for motorists with cars of moderate size and cost. The "Runabout" type, made by the firm, is typical of that class of instrument. This will record speeds accurately up to 40 miles per hour, and a total mileage of 10,000 miles, the mechanism being identical with that which operates the "Perfect" type, while the scope of the indicator renders it a very suitable fitment for any of the small cars now upon the market, and which, according to the views of agents, are most in demand.

(To be continued.)

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

M.U. AND R.A.C.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one who has, from the commencement of motoring in this country, taken the greatest interest in the movement, I have watched with much regret the split which has gradually taken place between the organizations on which we depend for protection and help, and it is with added feelings of regret that I have read the new Royal Automobile Club Scheme for a association.

It is an obvious attempt to wreck a useful and active body which has done much, and is doing much, for the development and protection of the interests of motorists in this country. I feel sure many who, like myself, have been actively interested in motor politics in the past, but have wearied of the continual strife, and have retired from the struggle, will see in this new scheme an endeavour on the part of the R.A.C. to bring about a return of the unfortunate position in which the provincial clubs found themselves prior to the resuscitation of the Motor Union in 1902.

A representative body, the Committee of the R.A.C. Associates, passed at Norwich, I believe, a resolution in favour of a joint scheme

pretext against a policy which can only have the effect of spreading dissension in the ranks of the provincial clubs, and thereby weakening our forces.—Yours truly,

J. A. COLE.

MOTOR-CARS OF THE FUTURE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a medical man practising in Devon, may I be allowed to give my ideas as to my, or, may I say, our wants? They are, a car of not more than two and preferably one cylinder, not less than 12-h.p., to seat four, the length overall not exceeding 10 ft., with the shortest wheel base possible, speed need not exceed 20 m.p.h. I have been driving an 8-h.p. Da Dion for the last three years. It will go anywhere or almost anywhere it is required to go, but at what a cost of energy to the driver! There are three routes, all good surfaces, leading out of the town in which I reside, and my gears have to be changed five times in one case, eight times in another, and four times in the third, all within one mile!

A four-cylinder car is to my mind simply a piling up of troubles,

A new Observatory is being erected on Mount Wilson, California. Professor Ritchey, who is in charge of the work, has to make frequent journeys to the summit, which is nine miles from the nearest town, the road rising no less than 5,300 ft. in that distance. At first he travelled on foot, but, a road having been built up the hill, the trip is now made by means of a motor-car. Some snapshots of the vehicle en route to the Observatory are reproduced in the illustrations above. [New York Motor World.]

of affiliation to both the R.A.C. and the Motor Union, and, possibly owing to my not following the reports of meetings closely, I cannot understand how a resolution so passed comes to be utterly and completely reversed by the Committee of the R.A.C. It was this unfortunate autocratic conduct on the part of the Club Committee which led to the trouble in the past.

I feel sure that the Associate members of the R.A.C. never for an instant thought that the Norwich resolution would result in the scheme now put forward by the club, but they are apparently powerless to prevent the inevitable disaster (probably amounting to extinction as regards some of the clubs) which this scheme threatens to bring about.

I have not attended any meetings this year, but I gather that the Motor Union has offered to agree to any generally approved scheme of joint affiliation, and that this offer has been finally declined by the R.A.C., as of course the club has a perfect right to do; but surely it should stop there and leave the provincial clubs to affiliate to each body separately, should they desire to do so.

I am a member of both the R.A.C. and the Motor Union, and I freely admit that several things have been done by both bodies of which I do not approve, but there is a considerable balance of good and useful work standing to the credit of each of them, and it is because I am sure that there is ample scope for each body to continue to do useful work on behalf of the motoring community, that I am led to

ignition and other, and a "long wheel base side entrance luxurious tonneau" is quite out of place in the tracks which are called by tourists Devonshire lanes. I am not complaining of the work my little car has done, and is doing, but I have often wished on a wet, pitch dark night, that it would plough through inches of mud without asking me to drop my gears so often. My short experience shows me that cars generally have more body than their engines can pull. Conceivably a pony might trot away with a brougham on a good road, but the brougham would soon do for the pony in the lovely lanes of the South Hams. Personally, when I scrap my staunch little friend I shall try a steam car without gears.—Yours truly,

W. N. EDMOND, M.B.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to this question I find a decided demand at the present time in Herefordshire and the district for a car about 15-h.p. With regard to improvements I should say that the greatest improvement now required in a car would be a reliable self-starter. I do not think that the recent outcry against motoring has affected our sales locally in any way, except it be that this has created the demand for the 15-h.p. car instead of a larger power.—Yours truly,

JAMES F RYER.

AERIAL FLIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The recent successes of the Brothers Wright, Mr. Henry Farman, M. Delagrange and M. Bleriot have attracted the attention of the whole world, and signs are not wanting that a wide-spread interest is now being taken by all classes of the community in this country in aviation. This being so, it may safely be predicted that Englishmen will not long be content to remain behind their Continental brethren in the study and practice of flight, and there is little doubt but that special difficulties which beset the path of the pioneer in this country are to blame for the fact that our countrymen have hitherto not been in a position to compete for the many valuable prizes which have recently been won by aviators across the Channel.

With a view to remedying this state of things, the Aero Club of the United Kingdom wish to make it more generally known that it is willing and anxious to lend its support and assistance to any aviator in this country, and my committee hope that in this manner many of the difficulties which confront the inventor at the present time may be overcome. The complete and responsible organisation of the Aero Club, and its close relations with the aero clubs of other countries, have placed it in a position to be of real service to the cause, and the terms of personal friendship existing between our members and all the leading aviators on the Continent cannot but be of considerable value in the early days of the movement in this country.

As the public are aware, considerable money prizes are still open, and in addition the Aero Club of the United Kingdom, provided reasonable support be forthcoming, is willing to offer prizes of a national nature, open only to British aviators. The conditions attached to these prizes will be of a less onerous nature than those of the existing prizes.

The Aero Club, of 166, Piccadilly, London, W., intends to organise a competition for aeroplanes in this country during the year 1909, particulars of which will be announced at a later date.

In conclusion, I may say that my committee are arranging to provide a suitable and private practice ground, with sheds, &c., and they hope that British aviators who may be confronted with any difficulties will communicate with the Aero Club.—Yours truly,

HAROLD E. PERRIN.
Secretary.

A TALE OF A TRIFLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "H." in the issue of the 31st ult., in his letter "A Tale of a Trifle," breathes into his remarks a spirit of criticism which is apt occasionally to lead motorists beyond the bounds of fairness.

Apparently, in the case quoted, there was justification for putting the blame on the makers, but one so frequently hears similar omissions unfairly attributed to them.

As an instance, in the cars manufactured under my supervision all the bolts, except where other methods are suitable, are fitted with split pins, but I have on more than one occasion seen that the majority of these have been removed either by the owners or their drivers, for the reason perhaps these pins may sometimes catch the cloths when cleaning down.

In the case of any of these bolts at some time becoming loose, I am afraid it is too much to expect the owner to remember that the split pins were removed after the car left the maker.—Yours truly,

E. A. RAINER.

MAGISTERIAL METHODS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—These extracts are interesting:—

"Daily Mail" Nov. 3rd.

Motorist's £40 Fine.

"Fines and costs amounting to £120 were imposed at Haywards Heath Petty Sessions yesterday, on motorists summoned for excessive speed."

John Charles Dawes, of 40, Bathurst Mews, London, who was summoned for two offences, and against whom there was a previous conviction, was fined £40 and costs; and Ernest Sayers, of Hove, who also had been previously convicted, had to pay £20 and costs, his licence being endorsed."

I was present at the Haywards Heath Petty Sessional Court on the Monday, and was regaled with a course of procedure which can only be stigmatised as a travesty of justice, whilst the levity of many of the participants was disgusting in the extreme.

There were some nine or ten chauffeurs arraigned for exceeding the speed limit, not, as it noticed, for driving to the common danger. They were placed in the box and the stereotyped notes of a sergeant read. An evident source of amusement to the magistrates, they were asked, "Do you want to be sworn?" "Have you any witnesses?" "Do you want to make a statement?" A few did make statements, only to be haughtily brushed aside by the clerk. The magistrates then retired for a

few minutes and came back with the various penalties and costs bunched together.

The trap was one of 8½ miles between Pyecomb and Bolney, on the Brighton road. The summonses had been received by registered post two days before the trial. Needless to say the penalties were atrociously heavy and out of all proportion to the wrong committed.

Road-hogging, scorching on frequented roads, and driving to the public danger cannot be sufficiently reprehended and punished, but surely, Sir, some fairness should be meted out to these men who have their living to get. It may be urged that the master pays the fine, but he cannot erase the endorsement on the licence. The only remedy is for motorists to boycott the roads, and the Brighton road especially. The loss to the towns and villages en route, and to Brighton, the terminus, would be enormous, and for this loss these petty and spiteful magistrates would be responsible.—Yours truly,

FRITZ MUHLENKAMP.

SOME PRACTICAL TIPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I have come across many useful tips in the *M.C.J.*, I venture to send you a few I have met with in my experience, in the hope they will be of use to some of your readers. The following is an engineer's dodge that is not known to many drivers. If a metal rod is held in the mouth and the end placed against the engine whilst running, and the ears closed by fingers, all the movements can be distinctly heard, and a knock, squeak, or grind can be located.

I frequently wonder why it is that the contents of so many tool-boxes hardly have anything more than a few spanners, a jack, tyre-levers, some

Touring in Ceylon.—A Road Scene in Colombo.

string and copper wire and some stray bolts and nuts that never fit, and a file with all the "cut" gone. Some drivers remind me in this respect of the shipwrecked mariners of whom Kipling says, "And all they had was one split pea," and some drivers do not even carry a split pin. I remember one driver who got stuck up in an out-of-the-way spot through a burst rubber connection to the water pipe, and he was put to hours' delay in getting a piece of hose to fit. Other drivers carry a spare valve but not a spring. I remember once I had the exhaust valve spring break on a 45-h.p. Mercedes; on these, one end of the spring fits into the valve slot, and it broke off at the end; not having another spring, I rigged up a cotter out of the blade of a penny screwdriver, filing this into shape, and it stuck up the remainder of the run.

Some engines, though tuned up properly, will not run at low speeds without spluttering and misfiring. I cured this in the case of a four-cylinder car by fitting springs to take up the slack in the control mechanism. There was a good deal of shake both ways in the contact breaker, and also the throttle valve and air control. With these parts moving under vibration the engine could not be expected to run uniformly. Fitting light springs to keep each control device in one direction quite overcame this difficulty and made a most pronounced improvement in the running of the engine at low speeds.

One of the most curious makeshift dodges I have heard of was that of a friend of the writer's who drives a delivery van. The engine stopped and he found the petrol pipe had broken off at the union to float chamber. Not having anything to effect the repair, and being some miles from a motor depot, he stopped the bottom of the float chamber up and filled up with petrol. Then, filling an oil feeder with petrol, he got his companion to sit on the dash and feed the carturettor with petrol through the hole at the top of the float chamber. This enabled him to reach a motor depot, after two stops to fill the feeder with petrol.

An unusual cause of "knock," after new rings had been fitted to a

piston, was due to the rings catching against the ridge worn by the old ones in the cylinder walls. This is caused by the new rings reaching slightly further up in the cylinder than the old ones, due to wear in the grooves. The trouble can be cured by placing a thin layer of tin or aluminium beneath the cylinder flange.

With a pressure-fed carburettor trouble sometimes occurs through a leak in one of the pressure pipes or joints. Generally, this occurs through vibration having loosened one of the joints, and in one case I knew it was due to a pin hole in the pipe. Dirt getting under the check valve controlling the pressure would cause trouble, as it prevents this valve seating properly. The valve should be taken out at intervals and cleaned. The best way to find a leak is to cover the pipes and connections with soap suds. The leak would show itself by bubbles the repair being then a simple matter.—Yours truly,

S. I.

RUSTY TYRE RIMS.

To the Editor of *The Motor-Car Journal*.

SIR,—Having had a bit of trouble through the rims of my wheels rusting and injuring the covers, I have wondered if any of your readers could suggest an economical and effective preventative. I suppose silver plating would be effective but not economical, even if possible, and would galvanizing the rims be possible or of any use? or, again, would it be possible to insert a strip of very thin sheet lead between the cover and the edge of the rim where the pinch is so sharp? My trouble is, that the edge of the rim gets rusty and practically cuts the bead off from the cover long before the tread is worn out; no doubt others have had the same trouble, and if they have found a remedy I should be very glad to profit by their experience and very grateful into the bargain.—Yours truly,

TRI-CAR.

[The rims of motor tyres should be occasionally inspected, for in the operation of changing tyres the paint is liable to be worn away at various points, and if these are not attended to rust will ensue. The plan usually recommended of dealing with the matter is to thoroughly clean the parts from which the paint has been removed, and then apply a good coat of air-drying black enamel.]

STORING PETROL.

To the Editor of *The Motor-Car Journal*.

SIR,—Referring to the letter in your issue of the 7th inst., "Cycle Mechanic" may keep up to 60 gallons of petrol in 2-gallon tins if kept in a storehouse such as is described in the regulations made by the Secretary of State under Section 5 of the Locomotives on Highways Act, 1896. These regulations are fairly generous, but if "Cycle Mechanic" cannot comply with the regulations and has to fall back on the local authority for a licence Heaven help him if he has to apply to the L.C.C. for one. His trouble will then commence.—Yours truly,

A MOTOR MECHANIC.

A SUGGESTION TO MOTORISTS.

To the Editor of *The Motor-Car Journal*.

SIR,—Below I send you a copy of a letter in reply to one appearing in a Cardiff paper. Possibly similar letters have been published in other papers throughout the country, and I would suggest, if anyone who has the interests of motorists at heart replies to any such letter, much of the prejudice and ill-feeling against motorists would be allayed.—Yours truly,

F. C. SHACKEL.

[COPY.]

THE MOTOR PERIL.

To the Editor of the "Western Mail."

SIR,—In your issue of to-day appears a letter from the Secretary of the Highways Protection League, which on the face of it implies an alarming state of affairs. With all respect to Mr. Barnes, the secretary referred to, I for one, as a motorist and one who takes a great interest in anything pertaining to this new industry, cannot allow such a misleading letter to pass without making a few observations on the same. To begin with, Mr. Barnes' statement that the number of accidents "is still upon the increase" is incorrect and apt to mislead, as Mr. Barnes has not mentioned the fact, which must be apparent to him, that the number of motor-cars on the road this year is very much greater than last year. Therefore I emphatically state that Mr. Barnes' "alarming increase" is one of decrease, thus showing that both motorists and the public are more careful. Mr. Barnes further states that out of the 100 fatal accidents, verdicts of "Accidental death" were brought in in thirty-six cases, and goes on to add "I have received no reports giving the verdicts in the remaining cases." I now suggest to Mr. Barnes that for the future he is more correct in his facts before making such extravagant statements, and I have much pleasure in informing him that in the very large majority of fatal accidents verdicts of "Accidental death" have been brought in. With the immense number of cars on the road, I maintain that the percentage of accidents is very small. This is not the first time that I have had to correct Mr. Barnes in his extravagant statements, and until he prepares his statistics more carefully it will not be the last.—Yours truly,

F. C. SHACKEL.

THE STORAGE OF PETROL.

SEVERAL correspondents having lately made inquiries re the storage of petrol, we give the following regulations of the Home Office:—

Where a storehouse forms part of, or is attached to, another building, and where the intervening floor or partition is of an unsubstantial or highly inflammable character, or has an opening therein, the whole of such building shall be deemed to be the storehouse, and no portion of such storehouse shall be used as a dwelling or as a place where persons assemble. A storehouse shall have a separate entrance from the open air distinct from that of any dwelling or building in which persons assemble.

The amount of petroleum spirit to be kept in any one storehouse, whether or not upon light locomotives, shall not exceed sixty gallons at any one time.

Where two or more storehouses are in the same occupation and are situated within 20 ft. of one another, they shall, for the purposes of these regulations, be deemed to be one and the same storehouse, and the maximum amount of petroleum spirit prescribed in the foregoing regulation shall be the maximum to be kept in all such storehouses taken together. Where two or more storehouses in the same occupation are distant more than 20 ft. from one another, the maximum amount shall apply to each storehouse.

Any person who keeps petroleum spirit in a storehouse which is situated within 20 ft. of any other building whether or not in his occupation, or of any timber stack or other inflammable goods not owned by him, shall give notice to the local authority under the Petroleum Acts for the district in which he is keeping such petroleum spirit, that he is so keeping petroleum spirit, and shall renew such notice in the month of January in each year during the continuance of such keeping, and shall permit any duly authorised officer of the local authority to inspect such petroleum spirit at any reasonable time. The regulation shall not apply to petroleum spirit kept in a tank forming part of a light locomotive.

TECHNICAL EDUCATION.

FROM the examiners' reports on the results of the examinations in connection with the City and Guilds of London Institutes, 1908, we take the following extracts relating to those in motor-car engineering:—

"The most common fault is neglect to confine the answer to the question asked. Indefinite statements such as:—'would cause inefficient running,' 'upsets the mixture'—are far too common. In spite of the general improvement the answers in steam were bad. The general low standard of actual knowledge in this branch is indicated by the fact that frequently the Albany type gear pump and even gravity systems were commonly used as means of boiler feeding. 12 per cent. of candidates used the low tension distributor or commutator for distributing the battery current to the four coils, and an incorrect order of firing was frequently given. In a question on locating faults, the answer should have described a ready method which could be used on the road without the use of special apparatus. The tests which are most easily applied should be made first, such as pulling the engine over to test compression and holding down trembler blades to determine which particular cylinder is missing fire. The fault should be located before any attempt to correct it is made. How often a motorist thoroughly upsets his ignition and carburation when the trouble is merely a broken valve cotter or cracked plug! Many answers, such as 'Examine the insulation of the high tension wires'—are crude and generally unpractical. A student should be able to locate the fault without seeing it, and say, for instance, that if the high tension wire to No. N cylinder has a poor spark at the cylinder and a good one at the coil then that high tension lead is faulty. With regard to the question on automatic carburettors, many students state that the automatic device is in order to maintain a constant vacuum on the jet; others attached great importance to the almost negligible effects of variations of atmospheric temperature, pressure, and humidity."

IN connection with the new engine the Daimler Company have adopted for their 1909 cars, and which has recently attracted so much attention, they inform us that, "Although it is manufactured under Letters Patent, and consequently, in common with all patented articles, carries no guarantee whatever as to its suitability for the purpose for which it is sold, we have no intention of evading responsibility on this purely legal ground. On the contrary, we guarantee in the fullest terms the 1909 type Daimler engine in respect of its principle of working, the material of which it is composed, and the workmanship employed in its construction. The only condition we make is that our responsibility is limited to doing the following things at one or other of our depots within a period of two years from the date of the sale of the engine:—(1) Thoroughly repairing any such engine which, after proper examination by us, is found not to be working satisfactorily. (2) Replacing any parts found to be defective in breach of our guarantee. (3) Replacing at a customer's option any such engine with one of our late mushroom valve type engines. We do not, of course, take responsibility for any contingent or resulting liability or loss arising through any defect, and our guarantee does not relate to defects caused by wear and tear, dirt, misuse, or neglect, but this proviso is of a character usual in the trade, and in our opinion does not detract from the real value of our guarantee."

CLUBS AND ASSOCIATIONS.

ROYAL.

THE present strength of the R.A.C. is as follows:—Members, 3,884; nineteen clubs directly associated, 4,362; thirty-six clubs associated through the Auto-Cycle Union, 2,565; individual associates, 814; total, 11,625.

On the recommendation of the Organising Committee it was resolved to send a communication to the committee of the Clubs stating that the General Committee was absolutely in accord with the decision the R.A.C. had recently come to respecting the question of joint affiliation.

On the report of the Organising Committee it was agreed that it would be a distinct advantage to arrange to hold an annual dinner for members of the associated clubs and all the motorists included in the scheme of association. Thursday, January 14th, was provisionally fixed as the date for the first dinner.

COMMISSION ON HORSE-POWER AND RATING FORMULÆ.—The first meeting of the Commission appointed to consider and report upon horse-power and rating formulæ took place on Wednesday (the 4th inst.) at the Institution of Mechanical Engineers. Mr. Berridge, M.P., presided, and the Commission consisted of members nominated by the Royal Automobile Club and by the Institution of Automobile Engineers. Mr. G. H. Baillie and Mr. Mervyn O'Gorman read papers entitled "Horse-Power Formulæ" and "The Various Uses of Rating" respectively. In the subsequent discussion speeches were delivered by Messrs. Legros, Russell Clarke, Rosenheim, Beaumont, jun., and Beavor. The discus-

August and September were actually booked for transport through the Touring Department of the R.A.C.

The Roads Improvement Association has received from the Royal A.C. a cheque for £75 as the club's contribution to the funds of the Association. Thanks have been conveyed to the Club for its support.

The New Forest A.C. and Hants M.U., which will in future be known as the Hampshire A.C., has become associated with the R.A.C. The Somerset A.C. has also signified similar adherence.

THE MOTOR UNION.

BEFORE next year's touring season the Union hopes to have appointed a recommended hotel and repairer in every centre likely to be visited by motorists. During October forty-seven hotels and thirty-eight repairers were given Motor Union appointments by the Touring Committee, bringing the aggregate number of both classes of appointment to 863.

At Oswestry last week Mr. M. Blewitt, of Birmingham, solicitor to the Motor Union, prosecuted a farmer for assaulting the wife of a member by striking her with a whip while she was sitting in a car. The Bench, after nearly an hour's consideration, announced that they were not unanimous, and that as there was a slight doubt the defendant would be given the benefit. This is the eighth prosecution for assaults on motorists undertaken by the Motor Union, and in seven cases it has been successful in securing convictions.

The Vanderbilt Cup Race.—Robertson on the winning Locomobile Car on a portion of the Motor Parkway.

sion was adjourned, the exact date of the next meeting being left to be fixed by the Royal A.C.

At the meeting of the committee of the Club on Wednesday, last week, Colonel H. C. Holden, R.A., F.R.S., on behalf of the club's delegates, reported the proceedings of the International Conference held on October 19th at Paris. The delegates of the Club were able to induce delegates of other clubs to fall into line in the matter of reducing the bore of the cylinders of cars taking part in international competitions during the year 1909, thus reducing the horse-power of competing cars. The Club hopes to still further reduce the horse-power at the conference next year.

It is satisfactory to find that the work of the Touring Department has been heavier for the time of the year than in any previous year. An agreement has been signed with the R.A.C. of Spain by which the R.A.C. will shortly be able to issue triptyques for Spain. Arrangements have been made through the Roumanian Consul-General by which triptyque Customs papers for the entry of cars into Roumania will be issued by the R.A.C. from January 1st, 1909. Steps are being taken to obtain triptyque Customs papers for Portugal. Arrangements have been made with the Pacific Steam Navigation Company for the appointment of a club representative in La Rochelle to assist members arriving in that port in connection with the various formalities. Similar arrangements will shortly be completed in connection with the Great Western Railway, for the appointment of an agent in Brest. A return has been obtained from His Majesty's Custom House according to which one-fourth of all cars taken over from England to France during June, July,

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

COVENTRY.

THE first meeting of the committee of the Coventry Branch of the Incorporated Institution of Automobile Engineers was held on Tuesday of last week, at Hertford Chambers, Coventry.

Mr. A. Craig, M.I.M.E., was elected chairman of the committee, and Mr. W. Morgan (Daimler, Ltd.) was elected honorary secretary. The other members of the committee present were:—Messrs. T. C. Pullinger (Humber, Ltd.), A. S. Hill (Coventry Chain Company), and J. S. Napier (Humber, Ltd.).

It was resolved to proceed forthwith with the formation of a graduates' branch in Coventry, and a general meeting of the pupils, apprentices and junior draughtsmen employed in the motor industry in the district will be held in the beginning of December.

BIRMINGHAM.

THE first meeting of the committee of the Birmingham Branch of the Incorporated Institution of Automobile Engineers was held on Tuesday, last week, at the Grand Hotel, Birmingham. Mr. Max. R. Lawrence (Wolseley Tool and Motor Company, Ltd.) was elected chairman of the committee, and Mr. B. J. A. Shaw (Sunbeam Motor Company) was elected honorary secretary. The other members of the committee present were Messrs. A. A. Remington (Wolseley Tool and Motor Company, Ltd.), and E. E. Baguley (B.S.A.). It was resolved to

proceed forthwith with the formation of a graduates' branch in Birmingham.

BRITISH MOTOR-BOAT.

SEVERAL members of the club have already made definite arrangements as regards their boats for the 1909 season. One member has purchased "Mercedes IV.," one of the fastest craft of four seasons ago. In 1904 she was regarded as the most advanced type of racing craft, her most notable success being the winning of the famous Cross Channel race. Her new owner will fit her with an engine of a make not yet decided, of moderate power, but sufficient to give her a speed of about twenty knots.

MANX.

THE garage of the Manx A.C., which has proved of great convenience to the members of that organisation, is composed of three separate stalls of wood and galvanised iron. The ground around has been rented by the club and is useful to members in connection with the washing of cars. It will also be utilised for more stalls should the development of motoring in the island demand such accommodation.

No attendant is kept, but each member of the club has a key and can have the use of the garage whenever required. When in the town of Douglas on business, motorists find it a great convenience, as some of the livery stable people do not care to take in motor-cars, and, even when they do, the results are not always satisfactory.

THE CYCLE AND MOTOR TRADES BENEVOLENT FUND.

AT the November monthly meeting of the Executive Committee Mr. E. M. Mayes was in the chair, and the hon. treasurer reported a balance of £1,058 18s. 3d. in the bank. Thirty subscribers, fourteen members, one governor, two life members, and three life governors were elected.

Ten applications for assistance were considered. In five cases pecuniary grants were made. The others were referred to the Emergency Committee for inquiry and action.

Mr. A. J. Wilson, the hon. secretary, would be glad to hear from any reader of the *M.C.J.* who may have influence in obtaining employment for a member whose health will be impaired by continued residence in London, and who has been recommended to the climate of the Canary Islands.

A suggestion that the Fund should have a table devoted to it in a corner of Olympia was not approved. At the Stanley Show the office of the Fund will be in the same position as last year, No. 153 in the Arcade entrance.

The reports that have been published of the recent banquet appear to have aroused very widespread interest, and opened the eyes of a great many people in the motor trade to the importance and value of the Fund.

AEROPLANE.

A MEETING of persons interested in the science of aviation was held at Claridge's Hotel on the 6th inst. to consider the desirability of forming an Aeroplane Club for Great Britain. Lieutenant-Colonel Mark Mayhew, who presided, remarked that so far not very much had been done in this country to advance the science of what, for lack of a better word, he described as aeroplaning, whereas in foreign countries, notably in France, great strides have been made, especially during the past six months. By getting together all the available stock of knowledge a club composed of people with means and time at their disposal could do a great deal for this new science. He therefore proposed that measures should be taken by those present to form a club devoted to the development of aerial navigation by machines heavier than air exclusively.

In the course of the discussion which followed objection was taken to the term "aerial navigation," and preference was expressed for "aerial flight." The prophecy was also ventured that in the future dirigible balloons rather than aeroplanes will be used for purposes of freight, but it was generally agreed that the balloon principle is being gradually but surely deposed by machines of the heavier-than-air type. In support of this contention it was mentioned that there is now a firm in Paris which guarantees to deliver within three months aeroplanes with a certified 10 kilometre flight.

It was decided that the newly-formed society shall be called "The Aeroplane Club," of which Captain Windham, the acting hon. secretary, announced that the Jam of Nawanager, Prince Borghese, Prince Serge, and Prince George Bolotoff, the Earl of Plymouth, Admiral Sir William Kennedy, Major-General Sir Alfred Turner, Colonel Tempier, Lieutenant-Colonel F. Ponsonby, Sir Joseph Dimsdale, Sir Claude de Creepigny, Sir Charles Wittewronge, Sir Horace Marshall, Mr. Percy Thornton, M.P., and M. Delagrangé have signified their willingness to act as vice-presidents. In nine weeks there has been obtained a membership of 720, of whom 300 have agreed to become district hon. secretaries, while no less than sixty have inventions relating to heavier-than-air machines.

THE Polack Tyre Company, Ltd., will shortly establish a factory in England for the manufacture of the Polack solid tyre.

MOTOR SCOUTS AND THE POLICE.

AN important case affecting the employment of "scouts" to warn motorists on the highway was heard before the Kingston County Bench on the 6th inst., when Sydney Sweeney, in the employment of the Automobile Association, was summoned under the Prevention of Crimes Act, 1885, for obstructing the police in the execution of their duty whilst engaged in timing motor-cars on the Portsmouth road at Thames Ditton on October 5th.

Mr. Muskett prosecuted on behalf of the Commissioner of Metropolitan Police, and Mr. Marshall Hall, K.C., with whom was Mr. Rowland Harker, appeared to defend.

Mr. Muskett, in stating the case, said P.C.'s Beck, Davis and Smith were proceeding to a motor trap or control on the Portsmouth road at Thames Ditton on October 5th when they saw the defendant, wearing the yellow armband of the A.A., standing at the side of the road. The defendant followed them, and when they reached the trap he took up a position about thirty yards away from the officer who was stationed at the beginning of it, and as motor-cars approached and the officers made preparations to time them, the defendant gave a signal to the drivers of the cars, with the result that they slackened speed and passed through the trap at a slower rate. Finding their efforts frustrated, the officers changed the position of the trap so as to time the cars going in the opposite direction, whereupon the defendant followed the officer who gave the signal, and stationing himself about the same distance from him outside the trap, warned approaching cars in the same way. This shifting about went on for some time, the direction of the trap being changed five or six times and the defendant shifting his position to the warning point on each occasion.

The case, added Mr. Muskett, was different from "*Bastable v. Little*," heard at the Croydon Bench in March, 1906, under the same section of the Act, in which the case was taken to the High Court, and it was declared that no offence had been committed. In that case the person charged was a private individual acting upon his own initiative, and it was not shown that any of the cars was breaking the law. In this case the defendant was the paid servant of the Automobile Association, acting under their orders, and was there to give warning to members of the association who displayed the association's sign in front of their cars.

Evidence was then given by P.C.'s Beck, Davis and Smith in support of counsel's opening statement.

The defendant, who said he had been in the Metropolitan Police for twenty-five years, was then called, and said the rules supplied to all scouts stated that they were to show their badge to all cars that were going at an excessive speed. This was his duty, and it was all he did. He did not know that there were police traps at these places, and he did not see any of the officers give signals to time cars. The two officers, Beck and Davis, were never a furlong apart. He never did anything to warn motorists that there was a trap in the neighbourhood.

Several roadmen were also called, who said the officers seemed to be close together and running up and down the road on their bicycles.

Mr. Marshall Hall said the police were no doubt annoyed by the action of motor scouts, whose duty was to warn all motorists against travelling at an excessive speed. Every citizen, he held, had a right, as the defendant had, to warn motorists who, he thought, were going too fast.

The magistrates having retired, the chairman said they were unanimous in convicting, and the defendant would have to pay a fine of £5, with £5 4s. costs.

Notice of appeal was given.

GENEROUS ACTION BY A MOTOR COMPANY.

RECENTLY an abortive action was brought against the Daimler Motor Car Company by Albert Gebbels, a Customs House officer, who was knocked down and injured by one of the Daimler Motor Company's cars, but in the action it was proved to the satisfaction of Judge Willis that the car was not being used by defendant's employees at the time in the course of their employment. Judgment was given for the company, with costs. Mrs. Gebbels subsequently went to the Daimler Company's premises and broke some very valuable plate glass windows, and the husband has since been found wandering about and had been an inmate of an observation ward. On the 5th inst. his Honour was informed that the Daimler Company had agreed to forego their costs, and had paid £47 for the benefit of this man and his family. Judge Willis highly commended the kind action of the motor-car company. Gebbels deserved much sympathy. The case showed that the very highest principles had actuated those who had control of the Daimler Motor Car Company.

MR. J. A. RYLEY, of 234, Martineau Street, Birmingham, will not be exhibiting at the Motor Show this year, but will be pleased to make appointments with his customers in London or Paris.

In connection with their exhibit at Olympia, Messrs. Humber, Ltd., have issued a little card giving a number of useful notes for visitors. In addition to showing the position of the Humber stand and briefly describing their exhibits, some handy particulars as to the best way to get to Olympia are included. A copy of the card will be sent free to anyone applying to Messrs. Humber, Ltd., Holborn Circus, E.C., or 60-64, Brompton Road, S.W.

CASES AGAINST MOTORISTS.

THE USE OF IDENTIFICATION PLATES.

Mr. George Cotterell, of Hungerford, was summoned before the Wokingham County bench for alleged fraudulently lending a motor-car identification plate to Mr. Gooch on October 6th. Police evidence was given to the effect that a car, presumably on a trial run, passed through Maidenhead and Wargrave on the day named with the number BL801 painted on a piece of cardboard attached to it. Enquiry revealed the fact that this was registered in the name of Mr. George Cotterell. On the same day he had sold a car to Mr. Gooch and used his own number to convey the chassis to Hungerford to have a new body built on it. The solicitor on his behalf admitted that a technical offence had been committed, but the magistrates, recognising the explanation, dismissed the case on payment of costs.

DISMISSALS.

James Boots, of Muswell Road, Fulham, was summoned, at Kingston, for driving a motor-car in Mark Lane, Kingston, which was prohibited to motor-car traffic on account of its narrowness. Defendant, who was driving a motor-van, said he saw the warning sign at the end of the road, but mistook it for a danger sign. The Bench dismissed the summons on payment of costs.

At Camborne, Richard Frank Davis, of Plymouth, was summoned for driving a motor-car to the danger of the public at Gwithian, and pleaded not guilty. After hearing evidence the magistrates dismissed the case.

SPEED IN THE PARKS.

At Bow Street Police Court, before Mr. Marshall-Hall, K.C., has been summoned for driving a motor-car in the Green Park at a greater speed than ten miles an hour—to wit, 18 miles an hour. Park-keeper Ford, who stopped the car, said that Mr. Marshall-Hall, who was sitting inside, stood up and shook his fist at him. Mr. Marshall-Hall, giving evidence for the defence, said that his car had followed behind a horse and trap from Hyde Park to the place where they were stopped, and they had not once overtaken it. It was not going so fast as eighteen miles an hour. In reply to the magistrate, he said he thought that his car did not exceed ten miles an hour; he should say that as near as possible they were travelling at ten or twelve miles an hour. He denied that he shook his fist at the park-keeper, but he thought he did use an epithet when the keeper told him that he was overtaking the trap he had been following. The magistrate remarked that Mr. Marshall-Hall had himself admitted that his car was exceeding the legal limit. He fined the defendant 40s. and 2s. costs.

SUMMONS AND CROSS-SUMMONS.

At Aldershot, on the 6th, Mr. J. D. Sturrock, of Kensington, was summoned by Colonel Willoughby Verner on charges of having driven a motor-car to the danger of the public, refusing to stop when requested, obstructing the free passage of the highway, and common assault. There was a cross-summons against Colonel Verner of assault taken out by Mr. Sturrock. Colonel Verner was driving in a dog-cart. He said his horse was restive, and that he put his whip up to cause the motorist to reduce his pace, which was forty miles an hour. Mr. Sturrock gave evidence that he was travelling at less than twenty miles an hour, and that he slowed down. Colonel Verner struck him with the whip as he passed. He followed the dog-cart and demanded the Colonel's name, the Colonel again slashing him with the whip. Colonel Verner told the Court that it was not true that he struck Mr. Sturrock as the car passed; but he did slash him with the whip when he seized the horse's head and made it rear, and when he assumed a threatening attitude. The magistrates fined Mr. Sturrock £2 10s. for failing to stop when called upon, and Colonel Verner £5 for assault. The charge of assault against Mr. Sturrock was dismissed.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

The new companies recently registered include Messrs. Wayman and Matthews, Ltd., of 1, Albemarle Street, W., with a capital of £5,500; the Imperial Brake Block Company (of Great Britain and Ireland), Ltd., with a capital of £20,000, and offices at 15, Cross Street, Manchester; the Motor Barge Syndicate, Ltd., and the Jones Motor and Cycle Company, Ltd., of Mold, these latter two with registered capitals of £25,000 and £2,000 respectively. Bennier's Motor Garage, Ltd., and the Bryanston Garage, Ltd., 15, John Street, Edgware Road, London, W., has been registered, with a capital, in each case, of £2,000.

At the annual general meeting of the Standard Motor Company, held on Tuesday, a dividend of 20 per cent. was declared and paid.

An application in the Chancery Division of the High Court of Justice on Tuesday for the appointment of a new liquidator in connection with the winding up of Argylls London, Ltd., was dismissed with costs by Mr. Justice Neville.

MESSRS. JOSEPH KAYE AND SONS, LTD., of Leeds, and 93, High Holborn, London, who have already supplied over 25,000 of their patent Seamless Serrated oil cans to H.M. Navy, have again secured the contract from the Admiralty for the whole of the future supplies for the ensuing three years.

ROAD REPORTS.

MIDLANDS.—A conference of Midland town councils at Birmingham has decided to take preliminary steps towards carrying out a road-making scheme between Birmingham and Wolverhampton, to cost from £50,000 to £150,000.

FARNBOROUGH.—The Farnborough Parish Council have complained to the Bromley Rural District Council of the excessive speed at which motor-cars pass through Farnborough, which is on the main road from London to Hastings. Furious pace, they alleged, was on the increase, and they recommended that application be made for a speed limit of ten miles an hour through Farnborough and Green Street Green.

EAST SUSSEX.—The Roads and Bridges Committee of East Sussex County Council recommend that application be made to the Local Government Board to impose a motor speed limit of ten miles an hour on the main roads in the village of Hartfield, on the London to Lewes main road, in the East Grinstead urban district, on the road in the parish of Worth leading from Crawley, and on the main road in the parish of Salehurst.

KINGSTON.—A correspondent suggests that something might be done by the authorities to lessen the danger to traffic at the bend of the road at the corner of Surbiton Park Terrace and Surbiton Road.

BRISTOL.—At Monday's meeting of the City Council at Bristol, the Watch Committee recommended that an application be made to the L.G.B. for an order limiting the speed of motor vehicles in Bristol to ten miles per hour. Eventually it was decided to request the Watch Committee to report again.

EAST SUSSEX.—Among the roads in East Sussex under repair are those between Muddles Wood and Sayers Common, Crawley and Handcross, The Dicker and East Hoathly, Cooksbridge and Chailley, Brighton and Falmer, Brighton and Rottingdean, Sedlescombe and Clipp's Corner, and that between Peasmarsh and Rye.

Even in the Hawaiian Islands motoring has now become very popular. Our illustration depicts a number of natives enjoying a trip near Honolulu.

New York Motor World.

SCOTLAND.—Road repairing is actively proceeding in the Dundee, Arbroath and Cupar districts, the surveyors making known through the press the particular stretches that are being dealt with each week.

SURREY.—At a meeting of the Surrey County Council, held at Kingston, it was decided to apply to the Local Government Board asking them to issue regulations prohibiting the driving of motor-cars at a speed exceeding ten miles an hour at the following places:—Station Road to Weybridge Bridge, Weybridge; from Bridge Road to Church Road, Weybridge; through the village of Shere to the railway arch at Gomshall Station; from Boxhill Station to the Drill Hall, Dorking; and from West Street to the Workhouse, Dorking.

AUTOMOBILE INSTRUCTION IN SCOTLAND.

Two important courses of lectures have been announced. In the Heriot-Watt College, Edinburgh, Professor Stanfield, M.I.C.E., M.I.E.E., will deliver a course on motor-car engineering intended especially for owners, users, and drivers of motor-cars, with laboratory demonstrations, commencing on Wednesday, November 11th, and in the Glasgow and West of Scotland Technical College, Glasgow, Mr. James Gunn is delivering the first series of a course of lectures on the same subject. The Scottish Automobile Club silver medal is to be awarded for the best examination results in both of these classes.

ALTHOUGH the business of Weigel Motors, 1907, Ltd., has lately passed through certain vicissitudes, we learn that manufacturing operations are being carried on at the works at Olaf Street, Latimer Road, Notting Hill, W. The 1909 models of the Weigel cars which are now on view at Olympia will be found to comprise various detail improvements.

FORTHCOMING EVENTS.

NOVEMBER.

- 13th (F.).—Inquiry into the application of the Surrey C.C. for ten mile an hour speed limits at Walton-on-Thames, and in certain thoroughfares in Woking.
- 13th-21st.—Olympia Motor Show, London.
- 14th (Sat.).—Thirty-third Annual Dinner of the Stanley Cycling Club, Hotel Metropole, London, S.W.
- 17th (Tu.).—Agents' Dinner in connection with the S.M.M.T.
- 18th (W.).—Annual Dinner of the Motor Union.
- 20th-28th.—Stanley Show at the Royal Agricultural Hall, London, N.
- 25th (W.).—Annual Dinner of the Founder Members of the Royal A.C.
- 26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.
- 28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

- 3rd (Th.).—R.A.C. Lecture by Mr. H. M. Wyatt on Magnetos.
- 13th (Sun.).—Closing day of the Paris Salon.
- 23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

JANUARY, 1909.

- 14th (Th.) (provisional).—Annual Dinner of clubs associated with the R.A.C.
- 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
- 26th.—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

War Office Fourteen-days' Trial for Light Tractors.

LIGHTING-UP TIMES—LONDON.

| | | | | | | |
|----------------|-----|----------|-----|----------|-----|-----------|
| Nov. 14th—5.10 | ... | 16th—5.6 | ... | 18th—5.2 | ... | 20th—4.59 |
| " 15th—5.8 | ... | 17th—5.4 | ... | 19th—5.0 | ... | 21st—4.59 |

To find the approximate lighting-up time in November for Birmingham 5 minutes should be added to the above times, 5 for Manchester, and 8 for Glasgow.

AUTOMOBILE ACCIDENTS.

A VERDICT of "Accidental death" was recorded after an enquiry at Hammermith with reference to the death of John Jones, aged sixty-four years, who was knocked down by a motor-car while crossing Walham Green Broadway. One witness deposed that the car swerved in order to avoid the deceased, who, according to an observer, if he had had the presence of mind to stand still, would not have been hurt.

A TERRIBLE collision between a railway train and a motor-car occurred at Northwich on the 5th inst., causing the death of Mrs. Le Neve Foster, of Bollindene, Wilmslow, and injuries to Mr. F. W. Pennyfather, Colbinston, co. Wicklow, and Frederick Talbot, chauffeur, Wilmslow. The party had come from Manchester, and at a point near Northwich Station, where the road is intersected by a level crossing, the car was overtaken by a goods train of nineteen wagons and engine. The chauffeur had pulled up the vehicle almost to a standstill, but the guard's van of the train, which was being backed, caught it and pushed it on to the line, pinning it against a heavy wooden fence. The wooden structure gave way, and the car was flung down the line, the occupants being pitched out. The car was smashed, and Mrs. Foster was killed instantaneously. Mr. Pennyfather sustained cuts on the head and bruises, and the chauffeur a scalp wound.

THE coroner's inquiry into the circumstances attending the death of Mrs. Le Neve Foster, who met her death in the collision between her motor-car and a goods train at a level crossing near Northwich, as related above, was opened at Northwich on Saturday, and adjourned *sine die* after formal evidence had been given.

PUBLIC SERVICES.

ALTHOUGH the first case heard at Brighton against the driver of a motor-cab for leaving his vehicle unattended has been dismissed, the Mayor has warned drivers that such a result will not follow future prosecutions.

THE general manager of the Royal Express Motor Company, of Chiswick, is Mr. Johnston Montgomery, with Mr. H. Grigg as works manager. The garage and repair shop is open night and day.

THE ease with which the little O.T.A.V. voiturette can be handled is illustrated by the recent experience of Mr. E. Thompson Willows. Having only taken delivery of his car a few hours previously, Mr. Willows started to drive the vehicle on the morning of the 1st inst. from Watford to Cardiff, leaving the first named place at 8.30 a.m., and arriving at the latter at 8 o'clock the same day. Mr. Willows had never before driven an O.T.A.V., but he got through the journey in remarkably good time. The manner in which this voiturette is being inquired for in distant parts of the world is best explained by the fact that during the last few days the Junior and O.T.A.V. Cars Company, Ltd., have received enquiries from South Africa, New Zealand, Singapore and other places.

MOTOR REPAIRING PLANT FOR INDIA.

OFTEN have we referred to the development of automobilism in India, where the improvement in the national highways is apparently keeping pace with the popularity of the motor-car. Many of the native princes have thoroughly equipped garages with workshops and all conveniences for keeping large studs of cars in running order, and now we learn that the authorities of the Morvi State, in the great Dependency, have erected an extensive motor repairing depot which will deal with the fifty to sixty motor-cars and lorries owned by the State.

This is being fitted up by Messrs. Drummond Bros., Ltd., of Ryde's Hill, near Guildford, and amongst the series of special tools, milling machines, &c., are included two of the firm's special motor repairing lathes, one of the medium light type 5 in. self-acting, sliding, boring, surfacing and screw cutting lathes, and one of their new heavy high speed all geared head, self-acting, sliding, boring, surfacing and screw cutting lathes. This latter tool is being fitted with quite a novel form of turret, which, when affixed to the saddle, converts the lathe into a full self-acting hexagon turret lathe, capable of rapidly producing any work required in quantities, such as standard bolts, studs, pins, &c., which cannot be procured up country in India. The establishment of such a works is a notable proof of progress, and Messrs. Drummond, Ltd., are well able to supply a plant that will enable the innovation to prove a success.

POLICE "CONTROLS."

THE Moortown trap on the Harrogate road is in active operation. MOTOR traps are being laid at Harraby, a village on the main road south from Carlisle.

POLICE-TRAPS are often in operation at Windlesham, near Chertsey. THERE are three and four mile traps on the Great North Road in the vicinity of Grantham.

THE police at Crawley are timing motorists in the 10 m.p.h. limit.

BUSINESS NEWS.

MESSRS. J. KEELE, LTD., of 72, New Bond Street, W., inform us that they have been appointed authorised agents for Renault cars, and that they have one of the new 50-60-h.p. six-cylinder Renault chassis on their stand in the Annexe at Olympia.

WE learn from Messrs. W. and G. Du Cros, Ltd., that all the cars exhibited on their stand (No. 36) at Olympia are fitted with coachwork designed, built, painted, upholstered and trimmed at the Panhard-Levassor Works, Acton Vale, W. Further than this, the stand itself and the company's accessories stand in the gallery were both designed and constructed entirely at their works.

THE Reo Motor Company are not showing at Olympia, but are holding during the coming week a special display at their showrooms, Broad Sanctuary, Westminster, where Mr. J. Lambie will be pleased to explain the features of the 1909 Reo models.

THE petrol used by Mr. J. H. Paterson, of the Caledonian Motor Company, Ltd., on the occasion of his run from Aberdeen to London last week, was the "Shell Spirit," "Vacuum" lubricating oils being also used.

THE litigation between the Argylls Motors, Ltd., and its liquidators and the Society of Motor Manufacturers and Traders, Ltd., with regard to the allotment of space at Olympia has been heard by Mr. Justice Neville, who dismissed the motion with costs, nothing having "happened to prevent the management committee from acting in the way they had done on the discretion which the rule (No. 1) gives them."

MR. T. UNDERWOOD, who has held a responsible position on the selling side in connection with the Wolseley Company for several years past, has resigned his appointment to take up a similar one with Clement-Talbot, Ltd. On leaving the Wolseley Company his old colleagues entertained Mr. Underwood to dinner at the Waldorf Hotel on Saturday last, and presented him with a handsome silver cigarette case as a token of their esteem.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, NOVEMBER 21, 1908.

[No. 507.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

ERE the Motor Show at Olympia has run its course the Stanley Cycling Club's annual exhibition at the Agricultural Hall, London, will open its doors to the public. This will be in progress till the 28th inst., and was preceded by the annual dinner of the Stanley Club on Saturday last, under the chairmanship of Mr. Robert Todd, the speakers including Alderman C. S. Elliott, J.P., Mayor of Islington, Mr. G. H. Radford, M.P., Mr. E. A. Lamb, Mr. M. Wyatt, Mr. E. P. Hewkin, and Mr. C. Sangster. In proposing the toast "The Stanley Show" the latter, referring to the exhibition question, said that from his knowledge of the inner working of the present Motor Exhibition he believed there was much to be said in favour of shows being run on independent lines.

The Motor Trade.

THERE were nearly 300 members and guests of the Society of Motor Manufacturers and Traders, Limited, present at the dinner held last week at the Hotel Metropole, London. The loyal toasts having been honoured, Sir Marcus Samuel, Bart., proposed that of "The Motor Industry" and gave a reassurance as to the supply of petrol being sufficient for the demands of any expansion that the industry may anticipate. Mr. E. Manville, the president of the Society, responded to the toast and referred to the advance which had been made in many directions during the year. Particularly was this seen in connection with the design and construction of vehicles. He appealed to motorists generally to second the efforts of those organisations which are endeavouring to suppress the small minority of people who are disinclined to consider others upon the road. The attendance of Prince Pierre d'Arenberg, who is the president of the Federation of the Automobile Clubs of France, gave Mr. Manville an opportunity of congratulating France upon the success of the recent International Road Conference, while the presence of Herr Gustav Vischer, president of the German Motor Trade Association, suggested to the speaker an equally complimentary reference to the motor enterprise of that country. Other speakers included Lord Ribblesdale, Sir West Ridgeway, G.C.B., and Col. H. C. L. Holden. An excellent musical programme followed, for which Mr. Frederic Coleman was responsible, his efforts to further the harmony of the evening being warmly appreciated.

An M.P.'s Reason.

SEVERAL meetings have lately been held in the House of Commons committee rooms with regard to motoring matters, and much discussion has arisen in consequence. In our correspondence pages Mr. W. E. B. Priestley, M.P. for East Bradford, explains the reason that led them to the resolution which has been finally adopted to the effect that the President of the Local Government Board and the Secretary for Scotland be urgently requested to issue a general notice that

when a local authority makes application for the fixing of a speed limit not exceeding ten miles per hour in any town or village under Clause 9 of the Act of 1903, the application will be granted provisionally until good reason is shown to the contrary. Mr. Priestley is not an anti-motorist in the sense that many of his fellow legislators are, and we agree with him as to the superiority of "just administration" over "repressive legislation." But we do not enjoy "just" administration under the present Motor Car Act.

A Police Omission.

IN a London police court the other day occurred one of those little incidents which bring the law into disrespect among motorists. Mr. W. Mosenthal was summoned for exceeding the legal limit and fined 40s. Then appeared a police-constable with the certificate of a previous conviction, and the following dialogue took place:—

Defendant (intervening): And it cost me £200 in law expenses to have the conviction reversed.

Mr. Staples Firth (who was present in court engaged in another case): Yes; I appeared for him. It was proved that deliberate lies were told.

The Magistrate: How is it the police produced in evidence the certificate of a conviction that had been quashed on appeal?

Inspector Belderson: It has been supplied by Scotland Yard.

The Magistrate: But surely they have information of a quashed conviction?

Inspector Belderson: Yes; I cannot account for it.

The Magistrate: They should be informed of the circumstances.

Really the police are so sternly exacting whenever a motorist is in the wrong that such omissions should not be tolerated; but for the fortunate corroboration of the solicitor who happened, by a providential accident, to be in court the defendant might have been put to considerable inconvenience.

Dazzling Headlights.

IN view of the early time which is now necessary for lighting up, motorists will do well to give heed to their lamps, an observation that is emphasized by the care with which the police are stopping cars whose rear lights are out of order. In the House of Commons, too, attention has been drawn by Captain Murray to the subject of the dazzling headlights employed on motor-cars, and asking that motorists should be compelled to use appliances designed to reduce to a minimum the excessive glare. Mr. Burns, in reply, said that if the matter could be dealt with by Local Government Board regulation he would see whether early opportunity could be found to deal with the matter. Such an utterance will give a new interest to some of the exhibits now on view in the Gallery at Olympia. The R.A.C., too, has resolved to endeavour to abate the nuisance. At the meeting of the Committee of the Club last week there was a discussion on the subject, the outcome of which was the passing of a resolution expressing the opinion that the use of any dazzling lights on motor-cars and motor-cycles was unnecessary and objectionable within the London County Council area, and that they should be prohibited. To bring the matter to a practical issue the Club proposes to hold a Headlights Trial in January or February, with the object of promoting the use of headlights that are efficient, but not dazzling.

Motor-car Imports and Exports.

A VERY marked decline took place during October last in the importation of foreign-built motor-cars and parts into this country. Of complete cars 222 were imported during the month, of the value of £73,548. The number of chassis imported was 249, valued at £79,912, while parts were responsible for £110,074, giving a combined total for October of only £263,534, as against £349,672 in the corresponding month of last year. The gross imports of cars (3,522 in number), chassis (2,795), and parts during the first ten months of the current year amounted, however, to only £3,619,688, as contrasted with £3,960,498 in the corresponding period a year ago. Turning now to the section relating to the exports of British automobile productions, these again show a slight decrease—from, in the aggregate, £156,416 in October, 1907, to £143,589 last month. Altogether 290 complete cars (£105,815) and 13 chassis (£5,580) were despatched from this country during October, as well as parts to the extent of £32,194. The gross shipments during the ten months ending with October are returned at only £1,027,557, which contrasts with £1,092,170 in the similar period of last year.

A Churchyard as a Motor Garage.

During the course of the recent Vanderbilt Cup Race, so great was the number of cars that lined the course that even the churchyard of the church at Woodbury was brought into requisition. The sexton, it is stated, has thereby added not an inconsiderable amount to the church funds.

Level Crossings.

THE danger of level crossings on roadways has been again emphasised by a fatal accident, and motorists would hope that steps will be taken to minimise the possibility of danger where they cannot be wholly dispensed with. With regard to the crossing where the recent accident took place a local correspondent writes:—"The road from Knutsford narrows considerably just before Northwich is reached, so that there is only just enough room for two vehicles to pass. It is at about the middle of this narrow stretch that the railway, a single line, crosses the road. To anyone approaching the town from Knutsford there is, apart from the flagman standing at the crossing, no means of telling that any crossing exists there or of seeing any train that may be about to cross the road in either direction, for all view of the line is cut off—on the left by high black boards that flank the road, on the right by houses and other buildings. The crossing has white gates. They do not, however, open across the road, but in the other direction. A motorist who was not well acquainted with the neighbourhood would, therefore, on driving towards the crossing in the direction of Northwich, see before him nothing to suggest the presence of a railway line except a man with a flag, and, as these are commonly used for other purposes on main roads, he might be very likely

not to catch the warning's true significance for a few moments."

London Traffic.

THE report of the London Traffic Branch of the Board of Trade, which has just been issued, has some facts of interest to motorists. It is computed that the total average number of journeys taken last year by people in the Metropolitan area was 300; doubtless increased by the substitution of motor for horsed traction. In 1906 there was a net decrease of 840 horse-drawn licensed vehicles, and in 1907 a net decrease of 1,582 as compared with the previous years; while in mechanically propelled vehicles (licensed) the increases were 891 and 1,421 respectively. The substitution of motor for horsed omnibuses has been marked. In 1905, 3,484 of the latter were licensed as against 241 of the former; in 1907, the numbers were 2,557 as against 1,205. In 1907, 297 motor-omnibuses presented for licence were rejected, a very high standard being insisted on by the special committee of three persons (not attached to the public carriage department) appointed by the Commissioner to advise him in this matter. And in 8,508 instances motor-omnibuses were, under the strict supervision and inspection which prevails, reported to be "unfit" after licensing, and were the subject of a notice "not to use till fit." Many of the vehicles were thus reported several times.

Technical Instruction.

FROM the City and Guilds of London Institute we have received an advance copy of the report of the work of the Department for the last session. We notice that gratifying progress has been made with regard to the classes in motor-car engineering in association with the Department of Technology. Not only was there an increase in the number of classes and students, but the examiner noticed an improvement in the quality of the papers submitted by the 158 candidates in the examination. The passes numbered 100 from the thirty centres which were represented. Although the improvement has been most marked, it is still evident that many who present themselves for examination have not a sufficient knowledge of general engineering or of the ordinary methods of machine drawing and sketching. A suggestion is made that local manufacturers could render useful service to the cause of technical instruction if they gave the worn and broken parts of fittings which have been spoiled during the manufacture, and other articles which they have dismantled and for which they have no use, to the teaching institutions that are now handicapped by the want of an adequate selection of car parts. Last week we made reference to facilities for automobile instruction in Scotland.

Dealing with Offenders.

AT the last meeting of the Automobile Association the important and significant step was taken of calling for the resignation of certain members of the Association, it being alleged that they had been guilty of driving in a way that was not regarded as seemly. This action should have a very salutary effect, for it places on record the fact that the automobile organisations have no sympathy with those who take great risks and incur danger to others. It has often been said that the adoption of resolutions against inconsiderate driving has been useful as a deterrent. We do not agree wholly with such a view, but we welcome the "expulsion policy" of the A.A. as testimony to the reality of the desire to establish a real regulation of motoring traffic on the road by the associations connected with the automobile movement.

So far as we can learn the agitation against motoring has not led to any undue prejudice in the Bristol district, nor has it interfered with the sale of vehicles.

A LADY MOTORIST'S VIEW OF THE OLYMPIA SHOW.

The Past.

ONCE again the glitter of brass and electric lights greets one's eyes at Olympia, and, to those endeavouring to put their impressions on paper, the same bewilderment at having to find the best out of such a plenitude of good. However, I was looking for novelties, so naturally my first endeavour was to get a glimpse of the new engine, but, instead of fighting a way through the crowd round the Daimler's exhibit, I went to the Minerva stand, and from thence to the Luca-Daimlers, where sectional 38 and 22-h.p. Knight engines can be seen more peacefully than at the Coventry makers. It is quiet in running, and the control is all that should make it desirable to drive; but, owing to our want of much real knowledge of its inward parts, it is, at present, more suitable for lady motorists who keep a good chauffeur. In this category might also be placed two other makes, which from their great originality of design forced themselves upon my notice: one, the Valveless, has been much improved since last year, when it was shown for the first time. It is very economical in petrol, and extraordinarily so in oil, owing to the patent lubrication system. The shape of the engine, which is now placed under the bonnet, allows of the body being brought well forward, thus giving plenty of room inside, as demonstrated by the limousine exhibited. The second unique design that struck me as specially interesting was the 28-h.p. "Dolphin" manufactured by the Two-Stroke Engine Company. It would take too long to describe the technical details, which are worthy of a special article; suffice it to say that accessibility and comfort have been well considered. A little detail that should be appreciated is the arrangement that enables the starting handle to be placed in nearly any position to start the engine, which greatly eases this tiresome process. The position of the steering wheel and column is adjustable, which makes it a comfortable car for people of all lengths and sizes to drive.

Another striking novelty is the Sheffield-Simplex, "the car without a gear-box," a welcome catch-phrase! This motor has been tried on the severest Scotch and English hills, and the absence of an orthodox gear-box has not been felt; it takes all but exceptional hills on the direct top speed, but when necessary to resort to a change there is a small sliding spur gear at the live axle end of the cardan shaft, actuated by the usual hand lever, this gives a low enough gear for any rational requirement.

The Napier stand is even more interesting than usual, as there is a departure from their 1908 design, and the introduction of a new scheme of business for this firm, namely, the building of small, moderately-priced models. In the 10-h.p. two-cylinder car the flywheel is placed in front of the engine, giving a better balance, while the final drive is by worm gear. It is just the car suited to feminine motorists who like an easy control. The N.E.C. is a firm that has always been associated with an original design. This year they are showing a particularly attractive model, a 40-h.p. open touring car; as the coachwork is in rich dark brown, and the interior upholstered in a pretty fawn leather, the colour scheme is charming. Owing to the four-cylinder horizontal engine being neatly stowed away beneath the driver's seat, there is an extraordinary amount of room in the car, it being possible to seat eight people inside and one beside the driver. The engine is not in the nature of a "freak," being merely an ordinary petrol motor, with the cylinders placed horizontally, instead of the vertical position. It is quite accessible, as the front seats are hinged and can be turned back, exposing all that is necessary to be touched. Not far from the N.E.C. exhibit is an absolute novelty in two-seaters. I refer to the 9-h.p. Pilgrim; it is a remarkably light machine, and with the even distribution of weight, by the driving mechanism being on the front axle, the wear on tyres, I am told, is marvellously small. The hand

brake is arranged to act on the back wheels and the foot-operated one on the front axle, through the differential gear.

The most notable development of this year's show is the production of medium-powered cars by firms long associated with cars of high horse-power; for instance, the Delaunay-Bellevilles are showing a 10-h.p. chassis; that it is just what the average motorist wants is proved by the orders which are being placed with the Burlington Carriage Company for this model. I was exceedingly pleased with it, and for a lady driver it is hard to beat. Those who have neither sufficient money nor nerve to buy a large racing car, yet want something with a smart and sporting appearance, should visit the Singer stand, where one of the most up-to-date looking two-seaters in the show is exhibited. It is a 12-14-h.p. four-cylinder chassis; the mechanical details are similar to the standard type, but a special rake is given to the steering wheel, lending a racing look. This also better suits the driver's comfort when ensconced in the low-seated though comfortable body. It is finished in a delightful shade of French grey, with black lines, and upholstery of a beautiful coloured red.

Of course, I have left many cars unmentioned that have interesting new details, for to describe them all would fill a volume, especially from the feminine point of view, as the latter-day bodywork is as absorbing a topic to the many as the engineering discussions are to the few. However, I cannot close without particularising one other make—a newcomer, and specially worthy of welcome, being a relative of our world-wide-admired friend, the Mercedes. It is known as the Royal Austrian-Daimler car, and has the distinction of being the choice of the engineers and experts who were commanded to select an automobile for His Majesty the Emperor of Austria. The chassis shown is a 20-30-h.p., the only type the company is at present turning out. Nearly every tiny detail is on sound motor-car engineering principles. Any feminine motorist wanting a motor that she can place sufficient confidence in to take out for long drives unaccompanied by a mechanic should make a point of inspecting the new model. Among other cars that I specially noticed as suitable for lady drivers to manage by themselves were the following:—The 20-h.p. Ariel, 15-20-h.p. F.I.A.T., 15-h.p. Rover, if fitted with touring body, and the 12-h.p. Humber, which is quite a marvel of cheapness.

C. B.

The Present.

In a recent Swiss case, the court, in estimating the sum payable to the family of a person killed by the negligence of the driver of a motor-car, included the claims of the deceased's fiancée. The driver had exceeded 60 kilometres (about 37½ miles) an hour. The sentence was one month's imprisonment, 2,000 francs fine, 373 francs costs, and 16,850 francs damages.

MESSRS. DENNIS BROS., LTD., Guildford, have sent us a photograph of one of the four 3-ton mail vans they have just completed to the order of Messrs. McNamara and Co., the Post Office contractors, Finsbury, who are running them between Portsmouth and London, and also between Southampton and London. The vehicles are fitted with a Dennis 35-55-h.p. four-cylinder engine, magneto and accumulator ignition, four-speed gear-box with gate control, giving a direct drive on the third speed, and geared up fourth-speed to reduce petrol consumption. The back axle is of the Dennis well-known worm-driven type, and the road wheels are shod with 5 in. De Nevers tyres. Messrs. Dennis are building some smaller vans to feed these large vehicles from the outlying districts, and the whole service starts on the 1st prox.

B

GOSSIP FROM PARIS.

THE efforts of the good people of the Maine-et-Loire have been crowned with success. The Anjou circuit has been officially accepted by the Sporting Committee of the A.C.F. for next year's Grand Prix. And the municipality of Angers means to make the most of it. The subscription for the subvention of £4,000 required for the great international competition has been more than covered, but the list has not yet been closed, because the money in excess of that amount is to be employed in a prize for the race, and especially for the organisation of a series of fêtes during the week which will culminate in the great event. The local committee has not yet arranged all the details, but the fêtes will comprise auto-boat races, balloon and aeroplane competitions, a Venetian fête on the Maine, &c. I learn from a member of the A.C.F. Sporting Committee that the 74 kilometres 322 metres (close on 46½ miles) of the circuit are in a fairly good condition, and that the Ponts et Chaussées engineers have undertaken to put the roads into a satisfactory state of repair by January 15th next. The circuit constitutes an irregular triangle, of which the base, extending from Candé to La Croix de Lorraine, a distance of about nineteen miles, is virtually straight. There are two other fairly long straight stretches, one of 6½ miles from La Croix to Saint Georges, and another of 2½ miles from Saint Georges to Saint Germain des Prés, where the grand stands are

Route Map of the Anjou Circuit on which the A.C.F. Grand Prix Race will be run next year.

to be erected. That stretch is, however, prolonged by seven miles, because on passing the stands in the direction of Candé the racing cars will have before them a good, if not quite straight, road as far as Riotière, where the first bad corner will be met with. Then, after following the rather difficult winding road for twelve miles, they will reach Candé. Here speed will have to be slackened considerably, owing to an especially dangerous turning. The same thing may be said of the turning at La Croix de Lorraine, where the road constitutes an acute angle.

THERE is one important question connected with the Grand Prix still remaining to be settled. Are detachable wheels to be permitted as well as detachable rims, or are both to be forbidden? So far as the French manufacturers of detachable rims are concerned they pretend to be indifferent to the idea of their suppression if the wheels remain prohibited. And most of them say they have no objection to the detachable wheels being permitted so long as their rims are not excluded. Far from having been made exclusively or even principally for racing purposes, the rims were invented for the convenience of tourists. But I am not quite sure the professed indifference to the raising of the interdiction of detachable wheels is absolutely sincere. I think experience concerning the advantages of detachable wheels, their lightness compared with the rims, and the rapidity with which they can be changed, have had considerable effect. However that may be, the drivers who will figure

in the Grand Prix hope sincerely that detachable rims or wheels or both of them will be permitted, because the work of changing the tyres would otherwise be too exhausting. Their drive of 743 kilometres will be quite enough. So far as I have been able to gather in conversations with members of the A.C.F. Sporting Committee, the French officials are likely to pronounce in favour of permitting the use of both the rims and the wheels, and if that is done no one will have any reason to complain.

EXTRAORDINARY activity prevails in what is called the "Monde d'Aviation." Dozens of inventors are busy building aeroplanes with which each of them is convinced he will win a good portion of the £47,780 already offered in prizes. Their ardour is yet more stimulated by the knowledge that the Aviation group of the Chamber has demanded the inscription of a subvention of £40,000 in the budget of 1909 for the encouragement of aviation. They perhaps naturally hope to participate in that windfall, though they do not yet know exactly how. In addition to all this and the numerous other prizes which will most surely be created before long, the Aero Club of France has decided to apply for the permission, which will doubtlessly be granted it, to issue a big lottery calculated to produce a profit of £200,000, to be expended in the creation of a fleet of steerable balloons and aeroplanes for the defence of the country. Such confidence, not only in the future of aviation as a means of locomotion, but in its immediate possibilities, is so boundless in France that many of the newspapers have already published the list of the large flat roofs in Paris which they think might be used as landing places for aeroplanes. I confess, however, that the aviators, who are the most capable of judging of "the immediate possibilities," are less ambitious. They will be quite satisfied if landing places for aerial vessels are provided outside the gates of cities and large towns. At any rate a great many improvements will have to be introduced into the existing machines before they can be made to alight with safety on the limited space of a flat roof, and then, so to say, hop off again like a sparrow. Several of the practical aviators to whom I have spoken are somewhat alarmed at the great expectations raised by the recent performances of Wilbur Wright, Henry Farman, and Bleriot. They are convinced that much greater things will be done before long, but they fear the disappointment which may follow the discovery that a good long time will probably elapse before the aeroplane can be made, as has been predicted, as practical for every day use as a bicycle will result in a lull in the enthusiasm and hinder the development of "the newest of the new means of locomotion."

MARNEY.

AN examination in connection with the Driving Certificates Department of the R.A.C. has been held at the Navy Employment Agency Motor Schools at Portsmouth.

So many questions have lately been asked in Parliament with regard to the skidding of motor-buses that it is satisfactory to learn from some of those responsible for the motor-bus services of London that the evil is undoubtedly being minimised, the drivers being now well accustomed to their work. The reduction of the rate of speed has also been a factor in this direction. In fact, the peremptory orders of the three leading companies in the Metropolis have been so well carried out that the accident staff has been reduced by about 20 per cent.

THE Motorists' Advisory Agency has been established at 12-14, Beak Street, London, W., with the view of assisting all interested in the automobile world. A system of monthly and quarterly inspections of cars is being carried out by qualified engineers, and those clients requiring repairs will be advised as to reliable firms with well-equipped establishments, and who charge on a reasonable tariff. A second-hand sale and exchange department has been established in which accessories as well as cars will be included. The hire department has several touring cars and landaulets at its service, and the rate of charges which appears in the explanatory pamphlet issued by the agency appears to be marked by a financial moderation which should assist in placing the Motorists' Advisory Agency well to the front among motoring concerns.

MY FRIEND GILFILLIAN AND HIS 6½-H.P.

By "Rus."

MY friend Gilfillian had a motor, though a small one with only a single cylinder and two seats and 6½-h.p. It is a motor of spirit—a stormy petrel; it can go well when its mind and Gilfillian's concur in that end, but, taken all over, I should say the motor has much more to say in such matters than Gilfillian.

I am motorless, and Gilfillian often asks me to join him to take the vacant seat, which I do sometimes just to please him and to endeavour to overcome a congenital timidity; besides, I am a doctor and he is my best patient.

Gilfillian is not a born engineer. He is an experimental philosopher, a searcher after truth. He tries all the levers and clutches one after another with nervous haste to find out which is the right one to effect his purpose; his great mind can rarely remember such mundane things from one trip to another. He knows the starting handle, however, and he has grand wrestles with it à la Hackensmidt. Brilliant expositions of both the "Græco-Roman" and "Catch as-catch-can" styles can safely be counted on. He could make money by doing it in an enclosure and charging 2s. 6d. per head, free list unnecessary—in fact, the reporters would tender their half-crowns, feeling that even the privileges of the Press should not be pushed too far; and so the small boy and his smaller sister and our neighbourhood generally

and giving vent to wild ejaculations like Chinese warwhoops, but there is no movement; apparently he has mistaken my great toe for the clutch pedal, and I mildly, but firmly, told him if he didn't desist I would throw him out among the spectators. I would have done it, too, even though to do so would be to violate the great and sacred laws of hospitality—laws which I have had and shall always have the greatest respect for—provided the other supplies the hospitality in a reasonably open-handed manner, and the more lavish the hospitality the more sacred will those laws ever be to me. I am still free for Christmas.

Gilfillian, taking my meaning, ejaculated the Ah! of discovery and struck the clutch with his foot; in it went with a click and off went the car "on the full jump," and so did the folk in front, and just in time to escape having the obverse side of a honeycomb cooler tattooed for life on the reverse of their several anatomies.

At the corner he nearly deprived the police force of one of its brightest and most substantial ornaments. The ornament contributed a shrill and sudden solo on his whistle, but it was as useless to try to whistle back that 6½-h.p. as would have been the fishmonger of the story whistling for his "partin" when run off with by the farmer's dog.

Tootling everyone, including some hitherto our friends, out

"The horse kicked and fought and gyrated this way and that."

gets a gratis entertainment every Saturday afternoon which keeps them hilarious till Monday—church hours not excepted.

When the handle has at length beaten its own previous record of jiu-jitsu throws and arm-racking back fires it closes its innings, so to speak, and consents to transmit Gilfillian's last desperate effort to the cylinder.

Gilfillian then jumps into his seat, jamming his elbow into my chest. Voiturettes are, as a rule, not too wide in the seats for two big men. I am big, but Gilfillian is bigger; but, as I am on board the car as a non-combatant, I have no reasonable excuse for returning such attentions, not being called on to do anything active but only sit in awe, if not admiration, at Gilfillian's lately acquired knowledge of motoring mechanics.

The now vibrating and buzzing bonnet seems all agog with energy, but Gilfillian is pulling levers and stamping on my feet

of the way, we went madly along the main street, Gilfillian trying all kinds of throttles and levers to check the speed, but without effect.

Policemen held up their hands to stop, but they had to skip as we approached. I saw note-books taken out, so let a rug hang over the back. It did not help the policemen to read the number and indeed was not meant to do so.

When we got into the country a bit our riotous 6½-h.p. consented at last to be more docile, so along we went smoothly for some ten miles or so until we came to Westbank, the house of a distant relative of Gilfillian's, who has a very nice place and two ditto ditto daughters. Everybody in the neighbourhood knows Mr. Espie and the Misses Espie. Gilfillian often goes there, and rumour has it that there will soon be one Espie less and one Gilfillian more.

We stopped, went in, were welcomed by all three, and stayed to tea. Gilfillian was eloquent on motors, and after tea led the way to explain to the young ladies the wonders of the mechanism of the 6½-h.p. An ordinary mechanic's explanations are marred by his plainness of speech and his very limited powers of illustrative and historic parallels, but not so Gilfillian. He is a widely-read philosopher, and so was able to bring home to their minds his meaning in a way which, if not so clear as a mechanic's, was of far more educative and impressive effect, as the pretty "Oh mys!" "Oh dears!" "How wonderfuls!" abundantly testified.

He even took bits out and put them in again. It was all so new to them, as their anachronism of a Pa still believed in the pre-historic horse, that they were much interested. Besides, they are still uncertain which Gilfillian wishes.

"Now," said he proudly, "we will get started"; so, after shaking hands and "See you soon again, I hope," and so forth, we got on board to a duet of sweet "Ta-Tas," but no, it wouldn't go off, it was again refractory. Out got Gilfillian, off with the bonnet, tried the plug, examined the commutator, and shifted things about generally; now it was, "This will be all right," on board again, new good-byes, but again no response from the ungallant engine, and so on and so on. It began to get dark and cold. Shouldn't the girls go in? Not they, they want to see the last of us. After about an hour and a half spent on the machinery it was discovered that the tap to the petrol feed was the cause of all the trouble, having got round to "closed" somehow; so, after all the time wasted on the machinery, we got away at last to the nineteenth or twentieth good-bye.

All went well for a few miles till the car slowed down and with an expiring gurgle or two the engine stopped altogether, and all Gilfillian's great skill and resource could not persuade it to start again. It was now quite dark.

A farmer's man taking home a horse from work providentially appeared about this time, and a bargain was struck that for a consideration the horse should tow the car to the nearest railway station, two or three miles off, where we could leave it and get home by train.

So the towage began, the man leading the horse, Gilfillian steering and I seated beside him. The road was rather hilly, and in the darkness Gilfillian couldn't see the tow rope, which caused him in going down hill to overrun it and get it mixed up in the wheels, infinite trouble being required to get it disentangled. Still we made progress—between whiles.

All of a sudden the engine tired of refractoriness, re-asserted itself, and went off with a sudden snort of recuperated power. Gilfillian had just time to steer clear of the horse's hind-quarters, and, passing it, caused the tow-rope to come right over the car and against me, nearly bisecting me and causing the horse to slue round with his stern to ours. Now came a struggle between machine and beast. Everyone knows that a horse cannot go twenty miles an hour, stern foremost. He isn't built that way—any steward of the Jockey Club will tell you that. So the horse kicked and fought and gyrated this way and that till at length he fell down a bank at the side of the road, dragging the 6½-h.p. and Gilfillian and me on the top of him, with his powerful legs beating wildly about. According to the Accident Assurance actuarial tables we should have been injured for life, at least, but somehow or another got clear; the horse, however, got in his revenge on the car by smashing the body so that its builder wouldn't have been able to recognise it—possibly he wouldn't wish to. Passages of—1, vituperation; 2, diplomacy; and 3, compensation took place between the man and Gilfillian, and we left the wreck of the car in charge of a roadman who lived close by.

We footed it home about six miles in pitchy darkness, having missed the last train, Gilfillian remarking that we were rather in luck, as the last time he was out he got stranded with ten miles to walk and pouring rain.

(To be concluded.)

SOUTH WALES has evidently not been affected in any degree by the outcry against motor-cars.

THE RECENT OUTCRY AGAINST MOTORING.

IT will be remembered that when the recent outcry against automobilism was at its height, and when, in the Silly Season, newspaper columns had to be filled somehow, many attacks were made upon motorists. M.P.s were worried by post and editors were pestered with letters. Some of the organisations concerned became alarmed and were inclined to regard the matter quite seriously. On the other hand, those of us who had watched the progress of automobilism in this country from the early days of the modern revival of the motor-car were not disposed to treat the attack so seriously—a view that received endorsement in the utterances of many leading motorists that found their way to our columns.

Now that calmer counsels are likely to prevail, we have endeavoured to ascertain whether the view we then expressed was justified by events. How nearly the actual position was gauged is seen in the following reports which we have received from correspondents in leading centres of the industry.

Should any of our readers have any criticism to offer with regard to these reports, we shall be pleased to hear from them and to give those who may have other views on the subject an opportunity of expressing their opinions.

NORFOLK.

The recent outcry against motoring does not seem to have adversely influenced the trade.

We do not think that the popular outcry against motorists (which comes and goes in spasms like any other form of madness) is affecting the outlook very greatly. No doubt the fear of a heavy tax being shortly placed on cars in proportion to their weight or h.p. has tended to turn the attention of people from the bigger class of car, but we do not think that it has affected the number of cars which will be sold this season.

KENT.

We do not think that the natural growth of the industry will be affected by the recent outcry, but we trust and believe that the agitation will have the effect of making motor owners more careful than ever not to offend a reasonable public.

PERTSHIRE.

The local complaints against reckless driving have caused an occasional police trap to be set, which, owing to the presence of scouts who have shouted "Trap" where there were no traps, have resulted in a large number of cars in the far North being needlessly sent home by rail, instead of by road. This caused a considerable reduction in the number of tyres sold during the month of October from the Perthshire depots—to say nothing of petrol and oil.

BERKSHIRE.

The county outlook has not suffered by the recent agitation against motorists, an agitation which is mainly to be attributed to the dust problem, and perhaps the inconsiderate driving of a few scorchers who, in tearing through the country, help largely to inflame the feeling which no doubt exists amongst other users of our roads who are not motorists.

DEVONSHIRE.

We do not think the recent outcry against motor-cars is lessening the local demand in any way. Fortunately motorists are not troubled to any extent by the police in the Exeter district, and it is only in the case of accidents, or extreme cases of fast driving, that they are brought before the magistrates and to the notice of the public.

CORNWALL.

Apparently there are a number of people in Cornwall who have been somewhat scared by the hostility of the police, and also by the rumours which seem to have been persistently circulated in that corner of the country as to the likelihood of increased taxes being imposed on cars in the near future.

THE SOUTH.

Combined with a persistent and rather too particular attention on the part of the police, the agitation has adversely affected the demand in Sussex and some parts of Surrey.

THE paper on the new "Valveless" engine read before the Royal Automobile Club by Mr. Chas. Y. Knight has been reprinted, and copies can now be had direct from the Daimler Motor Company, Ltd., Coventry.

AT Bournemouth eighty-nine cars and fifty-four motorcycles were registered, and 445 drivers' licences were issued during the first ten months of the present year.

THE employees of Messrs. Jackson Bros., of the Central, Station Road, and Imperial Garages, at Blackpool, have just had a motor run to Liverpool—by way of a change.

MESSRS. FRANCIS AND SON, of Pontardawe, in the Swansea Valley, have a motor vehicle—a 30-36-h.p. Commer car—which is much in requisition at this season of the year for football teams.

TO the show at Olympia eight motor bodies have been contributed by Messrs. R. and J. Shinnie, of Aberdeen, who from March till the recent dull days were building to order an average of five motor bodies per week at their works in the Union Row.

ON a recent visit to the Panhard-Levassor Works in Acton Vale, London, W., we found that Messrs. W. and G. Du Cros, Ltd., have again added to their accommodation. Two of the "bays" have been considerably extended, while the company are now putting down new power plant of a capacity of 150-h.p.

WHILE many centres of industry have lately experienced bad times, such cannot be said of the automobile business of Aberdeen. Work in that direction has been plentiful and the leading motor firms in the city (the Caledonian Motor Car Company, Ltd., Claud Hamilton, Ltd., the Rossleigh Motor-car Company, Ltd., the Arcade Motor Garage, Ltd., and Messrs. Campbell, Ltd.) report a good year.

ONE of our South American readers reports that within the last two or three years the motor movement has made remarkable progress in Buenos Ayres. There are at present, according to various estimates, from 1,000 to 3,000 automobiles in the city. The latter figure is evidently much exaggerated, but it is quite safe to put the number at about 1,500. It is a pretty sight, especially on Sunday, to see the long lines of fine cars in the park of Palermo, the aspect reminding one forcibly of the Bois de Boulogne in Paris.

THE Boilerine Manufacturing Company, of 885A-897, Old Kent Road, S.E., is finding its speciality attaining well-deserved popularity in connection with the preventing of incrustation in the water system of automobiles. Boilerine is mainly of organic origin, and the solution possesses the property of precipitating the salts of lime and other hardening substances, rendering the water soft, so that the formation of hard scale is reduced to a minimum. It has no deleterious effect on metals, and by using Concentrated Boilerine incrustation or scale is prevented, with consequent advantage in the running of a car. Several well-known motorists speak enthusiastically of its merits in this direction.

Now that classes in connection with motor-car design and construction are being organised at all the principal polytechnics and technical institutes throughout the country, instruction books of various kinds intended for the use of those who attend such lessons are beginning to make their appearance. Among them is that entitled "Notes on and Drawings of a Four-Cylinder Petrol Engine," which has just been published by Messrs. Longmans, Green and Co., 39, Paternoster Row, E.C. The book, which has been compiled by Mr. Henry J. Spooner, M.I.Mech.E., principal lecturer on motor-car engineering at Regent Street Polytechnic, comprises a set of working drawings of a 20-h.p. four-cylinder petrol motor. After a brief description of the method of operation of a petrol engine of the four-cylinder type, the author gives complete references to the various parts comprised in a modern motor, which, taken in conjunction with the drawings, should be of material assistance to those students who aspire to become draughtsmen in automobile engineering works.

GLASS engine bonnets fitted with interior electric lights for displaying the motor to public view are said to be growing popular with American motor-car agents, as a means of attracting attention to their demonstrating cars.

THE latest addition to the various makes of motor taxi-cabs in service in New York is the Humber, which are being imported by the Humber Import Company of that city.

THE commissionaire of the Fiat Company in Long Acre, W.C., was successful, with the aid of a dozen "Era" fire extinguishers, in overcoming an outbreak of fire which occurred the other day in the showroom of a carriage builder opposite.

IN a case heard at Reading recently, witnesses for the prosecution of a motor-car driver variously estimated the speed of the car in question at a mile a minute, 50 m.p.h., 30 m.p.h., and 20 m.p.h. The defendant was certain he never exceeded eighteen miles per hour.

WE illustrate herewith a new terminal for high or low tension cables which has lately been brought out by the Bosch Magneto Company, Ltd., 23, Store Street, W.C. The device is of novel construction and extremely light. In fitting it to a cable end the insulation must be of the same diameter as the bore of the thimble in the terminal. The insulation has then to be stripped off a sufficient amount to enable the twisted copper conductors to spread round the tubular washer. After the end of the wire is placed in position, as shown in the accompanying

sketch, the tubular washer is pressed into place and riveted over with a blunt centre punch, making a joint which is absolutely firm, yet which requires no soldering. The sleeves of the terminal are sufficiently long to give ample support to the cable by means of the insulation, so that none of the weight is carried on the conductor itself. A joint is by this means made which is extremely durable and entirely unaffected by vibration.

THE value of the motor-cars and parts exported from the United States during the nine months ending with September last only amounted to £856,545 as against £992,777 in the corresponding period of 1907. The United Kingdom heads the list with a total of £308,296, Canada being second with £199,576.

A GERMAN consular report calls attention to the growing use of motor-cars by the postal authorities in Spain for the transportation of mails. The following lines have already been established and others are contemplated:—Avila-Bejar, Avila-Penaranda de Bracamonte, Avila-Segovia-San Ildefonso, San Esteban de Pravia-Vega de Rivadeo, and Deva-Motrico-Ondarra-Berriatua-Plaza-Lequeitio.

FOLLOWING the success of their car department, the London and Paris Exchange Motor Agency, Ltd., have recently opened a motor accessory department with a stock of accessories at 55, 57, and 59, Shaftesbury Avenue, London, W.C. With a view of introducing this favourably to the notice of motorists a capital catalogue has been issued, and within its fifty pages are illustrated many standard accessories, as well as several novelties of importance to all who own cars.

CONTINENTAL NOTES.

Accidents in France.

The commission instituted by the A.C.F. to inquire into the truth of the alleged accidents caused by automobiles is already doing good work. Many cases of newspaper reports of accidents which never occurred have been exposed, and a yet greater number of accidents described as due to the furious driving or carelessness of motorists have been shown to have been caused by horse-drawn vehicles. Then, again, when the driver of a motor-car sacrifices himself, as he so often does by turning right off the road into a hedge or ditch or against a tree or milestone to avoid injuring a pedestrian or persons in a carriage, he is frequently described as having been the victim of his own imprudence. In this connection the statistics of the accidents in the Department of the Sarthe, furnished by the Sarthe Automobile Club, are very interesting, as they demonstrate once more that the self-propelled vehicles are much less "homicidal," as they have been called so often, than the "moteurs à crottin." During the month of October twenty serious accidents caused by horse-drawn vehicles occurred in the Sarthe, three persons being killed and seventeen others injured. During the same period four serious automobile

only £310,720. The biggest falling off is, of course, in the case of the United Kingdom, but the exports to the United States, Russia and Algeria have also declined. On the other hand, trade with Germany, Belgium, Switzerland, Austria, Italy, Brazil, and the Argentine Republic has increased.

Aeronautical News.

The Automobile Club de France has decided to concern itself with aviation as coming under the category of mechanical locomotion.—The prizes to be won by successful aeroplanists continue to multiply, the latest being one of £4,000 for a competition to be organised in the Brescia Circuit next August or September by the Italian Aero Club.—The "Petite Gironde" of Bordeaux is offering a prize of £400 to be competed for under the control of the Aero Club du Sud Ouest for the first aeroplanist who flies round the steeple of Celon Church and returns to the starting point in the Place de Quinconces, at Bordeaux, a distance of about five miles.—The new Aerodrome at Savigny-sur-Orge, France, was inaugurated on the 10th inst., when M. Delagrangé made several trial flights.—On Friday, last week, Wilbur Wright won the prize of £40 offered by the Aero Club of the Sarthe for the first aeroplanist

Mr. Henry Farman Preparing his Aeroplane for a Flight.

accidents resulting in the death of one person and the injury of three others. From October 1st, 1907, to October 31st, this year, the total number of accidents caused in that department by horse-drawn vehicles was 337. By these no fewer than forty-three persons lost their lives and 328 others were injured. On the other hand, during the same thirteen months only twenty-five accidents were caused by motor-cars, resulting in the death of two persons and the injury of twenty-three others.

French Motor-car Imports and Exports.

Returns just issued show that the value of the foreign motor-cars and parts imported into France during the nine months ending with September last amounted to only £222,160, as compared with £269,520 in the corresponding period of last year. As regards the exportation of French motor-cars and parts, the aggregate shipments during the nine months recently ended only totalled £4,047,120, as contrasted with £4,357,840 in the similar period of 1907. The shrinkage is entirely due to the quietness in the early part of the year, for during the past five months the exports have shown an increase over those of last year. This is shown by the fact that, whereas the decline in the exports at the end of May last was £517,360, it now stands at

flying at a height of a hundred feet. He also accomplished a flight without making use of the catapult for giving his machine a start.

The Nice Week.

The Nice Automobile Club is busy arranging the programme for the forthcoming automobile week; it will include a flower fete, a carriage body competition, an excursion to Saint Raphael, and a hill-climbing competition on La Turbie.

Miscellaneous Items.

Motor-cabs are about to be introduced into Brussels.—A company has just been formed in Naples to introduce a service of motor-cabs in that town.—The Swiss military authorities propose to hold a reliability trial of motor vehicles suitable for military purposes in June next year.—The Swedish Imperial Automobile Club has decided to organise a reliability trial of industrial motor vehicles during the coming spring.—A company has just been formed in Gothenburg, Sweden, to introduce a service of motor-cabs in the town.—The French post and telegraph authorities are at present inviting tenders for the transport of the mails between Vernon and Gisors by motor vehicles.

THE OLYMPIA SHOW.

General View of the Show.

SOME TENDENCIES OF DESIGN.

IT is difficult to imagine, as one walks round the Olympia Show and examines the beautiful specimens of modern automobile construction, that it is only twelve years since the motor-car became a legalised form of locomotion in this country. Were it possible to once more bring together the pioneer vehicles which took part in the memorable processions—the twelfth anniversary of which occurred on Saturday last—they would present a sorry spectacle in comparison with their modern prototypes. Yet those archaic machines were the result of years of much thought and study of a few capable engineers, whose labours have resulted in the up-building of an industry that is rapidly becoming one of the most important of the country. And yet, even with such quiet, easy running and reliable cars as are being turned out to-day, he would be a bold man who would venture to say that finality has been reached. If proof were needed to negative any such statement, it is to be found in the many new developments which have been brought under the public gaze during the present week. The Knight engine, with its cylindrical slide valves, has, of course, found many critics, but those who have adopted it may be credited with at least an average amount of business acumen. The more familiar type of motor is, of course, a distinct improvement, from all points of view, on that of even a year ago. It has, however, been demonstrated that there are more

ways than one of building a highly efficient engine working on the Otto cycle, and, now that the ball has been set rolling in another direction, quite unexpected developments are not at all improbable. It may be, too, that the two-cycle engine will within a not distant period enter on the scene with a blaze of light behind it that will eclipse the motor that is at present enjoying the favour, not only of the public, but also of automobile engineers. We firmly believe that if only one half the experimental work had been centred on the development of two-cycle engines that has been devoted to the four-cycle, the advocates of the former would not be confined to the couple of firms exhibiting cars with such engines at Olympia, but their numbers would be almost if not quite as great as those showing motors working on the four-cycle system. Another noteworthy feature of the Show is the indication it affords of the increasing attention that is being given to steam cars. Although the number of different types on view is only four—and consequently bears but a slight proportion to the petrol machines—it is the largest that has hitherto been seen at Olympia.

With regard to the general tendencies in what may be termed the petrol automobile world, these are of so varied a nature that they cannot be summed up in the proverbial nutshell. The six-cylinder engine is in somewhat of an anomalous position, for while the oldest advocate thereof has again added four and even two cylinder cars to his output, others continue to confine their attention to the six and yet others have given them up entirely in favour of the "four."

The reports that have been current during the past season of a decline in the general demand for cars of high power are substantiated by the production by old-established firms of vehicles of smaller power than hitherto turned out, the result being a large increase in cars of from 15-h.p. to 25-h.p. So far as concerns the details of petrol motors, it may briefly be said that the practice of casting the four-cylinders *en bloc* appears to be growing in favour, while high tension magneto ignition is by far the leading system employed, the great improvement which has been effected in these machines during the past two years having done much to ensure their present popularity. By careful attention to carburation, size of valves, &c., what is perhaps erroneously termed the "flexibility" of petrol engines has been vastly increased, and at the same time they leave little or nothing to be desired in the way of quietness of operation. One prominent feature of all modern motors is the improved methods of lubrication; in the majority of vehicles this is now positively effected by a pump in conjunction with arrangements for preventing any excess of oil passing to the engine, and, consequently, any emission of obnoxious smoke.

Glancing now for a moment at the transmission, and taking first the clutch, it will be found that the struggle for supremacy between the modern multiple disc type and the older leather-faced cone pattern is still waging. As for the change-speed gear, the gate control, with its series of selecting

rods each connected with its respective sliding sleeve in the gear-box, is now being fairly generally used on small cars, while on the bigger vehicles it is *de rigueur*. For the final transmission the cardan shaft drive is far and away in the majority, such old advocates of the chain drive as Panhard, Mercedes and Fiat now turning out live axle cars as well as those with side chains. It would seem that the next battle will be between the bevel and the worm drive, for the latter has lately secured one or two new and notable adherents.

As for the bodies of motor-cars, these continue to show great improvement. For a long time complaints were rife that the carriage builders had not kept themselves abreast of the times, but now that the automobile is no longer used for pleasure purposes alone, but is slowly yet surely driving the horse-drawn carriage out of existence, and even threatening the railway train as a means of conveying people long distances, they have at last realised a new era has dawned for them, the opportunities of which they have seized upon in a way which reflects the greatest credit on the whole carriage building industry.

With regard to prices, while there is undoubtedly a wider selection of medium power vehicles available, there is no marked tendency towards reduction in first cost, the efforts of manufacturers being apparently not to turn out cheap cars, but to supply much more reliable vehicles, or, in other words, to give greater value for money than hitherto.

ARCANUM.

The Lorraine-Dietrich Cars.

The Lorraine-Dietrich cars are exhibited by LA SOCIÉTÉ LORRAINE-DIETRICH on two different stands, the Continental-built vehicles being displayed on one, while the other is devoted to British-built vehicles. Dealing first with those which hail from across the Channel, it may be stated that three models are on view, these including a 15-h.p. landaulet, a 20-h.p. landaulet-phaeton, and a 30-h.p. limousine. As regards the mechanical details of the chassis, which, with the exception of the 15-h.p., are all of the chain-driven variety, the changes that have been introduced are relatively slight, intended to increase the accessibility of the various parts, notably the oil and water pumps. Taking the 20-h.p., of which a polished chassis is shown, as typical of the type, we find the four cylinders, 110 mm. bore by 130 mm., are cast in pairs, with the valves on opposite sides. The ignition is by low-tension magneto, with automatic advance according to the speed of the engine. At the

side shaft to a separate bevel on the differential. There are thus three pairs of bevel wheels in connection with the driving gear. Special attention has been devoted to the brakes, those working in drums on the rear wheels being supplemented by two brakes on the differential shaft operated by a single pedal. A new model Lorraine-Dietrich 10-h.p. two-cylinder live-axle car fitted with two-seated runabout body is probably now on view, but had not arrived at the time we visited the stand. Turning now to the English-built model, this is a 20-h.p. live-axle car, comprising many interesting features. The engine has four cylinders cast in pairs, 110 mm. bore by 130 mm. stroke, fitted with low-tension magneto ignition. The lubrication is automatic; it is operated by means of a mechanical pump, which forces the oil up to a

Fig. 38.—Sectional Views of the Lorraine-Dietrich Carburettor.

same time, a hand control is fitted, so that the firing point can be set to any desired position. The lubrication of the motor is maintained by a pump driven off the cam shaft, this forcing oil through two feeds to the base chamber, in which a certain level is maintained, any excess passing over the overflow back to the oil tank. A clutch of the metallic disc type transmits the power to the gear-box through a universal joint, which allows for any slight distortion of the frame whilst travelling over rough roads, and also permits the clutch to be dismantled without disturbing the engine or gear-box. The latter, which is "gate" controlled, provides four speeds forward and one reverse. By a special arrangement the third and fourth speeds are driven direct from the engine to the countershaft. The main shaft carries at its rear end two bevel pinions, each meshing with corresponding bevel wheels concentrically mounted on the differential shaft. On the first, second, and reverse speeds the power is transmitted through a bevel pinion on the

Fig. 39.—Details of Spherical Bearing on the Lorraine-Dietrich Live Axle Cars, by which the Spring-carrying plate is attached to the axle.

sight-feed lubricator on the dashboard, it being afterwards pumped under pressure to the various bearings. A feature of the engine design is the employment of a ball-bearing at the forward end of the crank shaft. Two sectional views of the carburettor are given in Fig. 38, from which the simple arrangement of the few working parts and the somewhat unusual position of the needle valve in relation to the float is noticeable. The petrol supply passes through the small wire gauze filter G F, neatly arranged below the needle valve N V. The needle valve is enclosed in a small chamber quite separate from the float, the connection between the two being by a cross lever F L. A small coil spring in place of the ordinary weights, situated outside the chamber, keeps the needle valve in position. The jet is of the single type, the spray of petrol being broken up by a small cranked (to clear the throttle spindle) rod S, which is placed directly over the orifice of the jet. Hot air is delivered

through the port H P, and its varying volume governed by the butterfly valve H V, which is automatically coupled to the throttle spindle H L by means of an adjustable slotted tie rod. The gear-box provides four speeds forward and one reverse, operated by a "gate" controlled lever. The drive is transmitted to the live axle by means of a cardan shaft, which is supported by a cold-drawn taper steel tube, the latter acting as a torque rod. The rear axle is very strong in design, is oil-retaining, and fitted with ball bearings. The two halves of the live axle are each coupled to the differential gear by an excellent ball-bearing universal joint, which enables the rear road wheels to be splayed as in chain-driven cars. The drive is taken through inverse dog clutches engaging with the outside ends of the road wheel hubs, in which similar clutches are provided. The ball bearings of the hubs are mounted upon the axle casing, so that the live axle itself has only the driving effort to withstand. The bevel casing is formed in two parts, joined horizontally; the top half is made of cast aluminium, whilst the bottom portion is of cast steel. From these drawn steel sleeves extend to spring brackets, the construction of which is shown in Fig. 39. It will be seen from the latter that to allow for the motion of the springs a spherical joint is fitted inside the spring bracket; by this device the twisting strain upon the spring and the wear of the shackle bolts is much reduced. The complete cars on view include a 20-h.p. chassis fitted with a Mulliner cabriolet body, and another with a special enclosed "all-weather" body by Salmons and Sons; this vehicle is arranged to be driven from the inside, and can be open or

(the chains being enclosed in gear-cases), are of the live axle type. In connection with the transmission, we note that the leather-faced cone clutch is retained. The gear-box is of an entirely new design, its feature being its compactness and correspondingly short shafts. The rear end of the clutch shaft is furnished with an externally toothed pinion for driving the lay-shaft and internal teeth for the direct drive. The shaft is made hollow to receive the corresponding half of the coupling belonging to the third and fourth speed sliding member. When the direct drive is out of action the coupling separates, and telescopes inside the end of the clutch shaft. When the direct drive is in use corresponding economy of length is obtained by telescoping the third-speed gear wheel inside the second-speed gear wheel. To avoid unnecessary wear and insure silence in the gears the reverse pinion is arranged to be brought into mesh radially by an eccentric motion, so that when not in use it is at rest. The "gate" lever is of new design, provided with a locking device on each of the speeds. The cardan shaft has universal joints at both ends; the live axle is provided with a pressed steel casing continuous from end to end, the enlargement for the differential and bevel gear being covered by a detachable aluminium plate. A new departure is the fitting, without extra charge, of detachable wire or wood wheels, as may be selected by clients. The Daimler Co. inform us that they have satisfied themselves that detachable wheels offer greater advantages than those of any other type, and consequently they have adopted them as a standard practice, except in the case of the 48-h.p. model, where the chain drive method

Fig. 40.—Chassis of Daimler 38-h.p. Car with new Silent Engine.

closed as desired; the style is quite novel, the vehicle having an attractive appearance.

The Daimler Cars.

Needless to say the stand of the DAIMLER MOTOR CO., LTD., has throughout the week been thronged with visitors anxious to examine the new Knight engine, of which so much has been heard recently. As this novel motor was fully described and illustrated in our issue of the 19th September last, it is unnecessary to refer to it again in detail. Briefly stated, the feature of the new motor lies in the fact that two sliding slotted sleeves, interposed between the cylinder and its piston, and actuated by an eccentric shaft, replace the old mushroom valves and their operating mechanism. Absolutely positive, the new practice is claimed to be not only lighter, but infinitely more rapid than the old method of induction and exhaust actions; at the same time, the arrangement gives positive valving, a spherical explosion chamber, direct ingress and egress of gases, and efficient cooling propensities, as well as comparatively light weight and accessibility of parts. The new motor is so startling a departure from the usual practice that it has not unnaturally met with much criticism; the Daimler Company have, however, convinced themselves of its merits, so much so that they have entirely abandoned the old type for the new one, which is being fitted to all the four models they are turning out for the 1909 season—22-h.p., 38-h.p., 48-h.p. four-cylinder, and 57-h.p. six-cylinder, the cylinder dimensions being respectively 96 mm. by 130 mm., 124 mm. by 130 mm., 140 mm. by 150 mm., and 124 mm. by 130 mm. All the cars, with the exception of the 48-h.p., which has side chain drive

of transmission, and the cases protecting it, render the fitting of these wheels a matter of some little difficulty. The complete cars on view include a 38-h.p. chassis with "Coventry" type landaulet body, painted green, with black mouldings, and lined light green, and a 48-h.p., fitted with "Nottingham" limousine body, painted ultra blue, with black mouldings, and fine red lines.

The Nameless Car.

A new four-cylinder car of British manufacture is that shown in the Annexe by the NAMELESS MOTOR-CAR CO., of Hendon, of which Mr. W. P. Lindsay, A.M.I.M.E., is the manager. The vehicle is fitted with a White and Poppe engine, 80 mm. bore by 90 mm. stroke (15.9-h.p., R.A.C. rating). The change-speed gear is gate-controlled, giving three speeds, the lay shaft being idle on the top direct drive. A useful feature is seen in a positive locking device, by means of which no two gears can be in mesh at the same time. The final drive is by propeller shaft and bevel gear to live axle. Special attention has been given to the brakes; the foot brake consists of two cast-iron slippers, with a compensating toggle action, working on a drum at the back of the gear-box. The rear brakes are of the compensated internal double-expanding type, there being two cams to each drum. The front axle is of H-section steel, having a slight forward rake, which is adjustable, and also provided with centre-pivoted hubs, which permit a simple form of rack and pinion steering to be employed. The silencer is of special design, consisting of a number of small but long tubes, and giving, it is claimed, a quiet exhaust with no back pressure. The car, which is fitted with ball bearings throughout, has a wheel base of 8 ft. 6 in.

The Humphris Car and Gear.

For some time past reports have been current with regard to the introduction of a car fitted with a somewhat novel departure in the way of change-speed gear. The new vehicle is now shown to the public for the first time by the HUMPHRIS GEAR AND ENGINEERING COMPANY, LTD., of Eastleigh. As in the Sizaire-Naudin cars, there is no gear-box in the ordinary sense of the word, the driving and the change-speed mechanism being all contained in the back axle casing, a direct drive being obtained on all the forward speeds. There is this difference between the Humphris and the Sizaire-Naudin cars, that whilst in the

Fig. 41.—Plan of Chassis of Humphris 15-17-h.p. Car with special Change-Speed Gear.

latter the various speeds are obtained by a single crown wheel and different-sized pinions, in the former a single pinion works in conjunction with a large disc on which four circles of holes are formed on the face. In place of and corresponding to the usual bevel pinion, there is a six-armed pinion with helmet-shaped arms. By means of rods connected to the clutch pedal, the large disc on the rear live axle can be withdrawn to one side, and by means of rods to the change-speed lever the pinion can be pulled across the face of the disc till opposite to the circle of holes desired, corresponding to the first, second, third, or fourth speed. The clutch pedal is then released and the holes of the disc and arms of the pinion brought into mesh. It is claimed that slip is practically eliminated by the shape of the arms and the holes, and that as it gives a true rolling motion, there is a great gain in efficiency, strength, and absence of friction, and a corresponding reduction in wear. The whole gearing, reverse and differential, is contained in a casing very little larger than that of the average-sized live axle. Another new and somewhat startling departure is seen in the arrangement of the whole of the working parts, which from the engine to the back axle are enclosed in a rigid casing formed of parts bolted together, the motor itself being supported on trunnions, on which it is free to follow any movement transmitted to it from the back axle, and ensures a perfect alignment between the two parts. The clutch transmits its power by a long shaft enclosed in a rigid tube to the patent driving gear. The suspension of the frame is also on special lines, the usual semi-elliptic springs at the front and three-quarter-elliptics at the rear being supplemented by a compensating transverse spring connected with the axle casing and the frame in such a way as to some extent relieve the live axle from shock when travelling over bad roads. The chassis on view—a plan of which is given in Fig. 41—is of 15-17-h.p., being fitted with a four-cylinder engine 85 mm. bore by 100 mm. stroke. Although the new gear is quite a new idea in power transmission, we are assured by Mr. O. F. Mundy, of 4, Albany Court-yard, Piccadilly, W., who has secured the British selling rights, that the car has been submitted to severe and lengthy tests with entire satisfaction.

The Fiat Cars.

Among the cars which deservedly enjoy a high reputation in this country are the Fiat. Two new models are to be seen at the stand of FIAT MOTORS, LTD., the first being a 12-14-h.p. live axle machine, in which there are many points of interest. The four cylinders of the engine are cast in one piece, and are 80 mm. bore by 100 mm. stroke. The ignition is by high-tension magneto. The carburettor is of the Fiat Company's own design, it being water-jacketed and fitted with an automatic auxiliary air valve. A small gear pump is provided to force the lubricating oil through the hollow crank shaft and connecting rods to the main bearings. The water circulation is maintained by a gear-driven pump and honeycomb radiator, the arms of the fly-wheel being arranged to act as a fan in drawing air through the latter. The transmission is through a clutch of the well-known Fiat steel disc type

running in oil, and a gate-controlled three-speed gear-box. The cardan shaft is enclosed in a casing which forms an extension of the rear axle sleeve, the forward end terminating in a forked bracket hinged to the gear-box. The car has a wheel base of 8 ft. 4½ in. The second new car, of which a polished chassis is exhibited, is a 40-50-h.p. live-axle machine, in which all the special points of the Fiat design are incorporated. The bore and stroke of the engine is 130 mm. and 150 mm. High-tension magneto ignition is fitted, as also a forced system of lubrication. In order to facilitate starting, the engine is provided with a half-compression device acting on the inlet valves. The carburettor is of a special patent type. The additional air supply and the throttle are controlled by the accelerator pedal, thus simplifying the control to a remarkable degree. Other exhibits at the Fiat stand include a 12-14-h.p. landaulet, 15-20-h.p. standard live-axle chassis fitted with a three-quarter landaulet body by Messrs. Maythorn and Sons; a 15-20-h.p. Victoria phaeton body by Messrs. Brainsby and Sons; a 28-35-h.p. polished live-axle chassis; and a 28-35-h.p. limousine with Maythorn body.

The Panhard Cars.

Four sizes of the well-known Panhard cars are displayed on the stand of Messrs. PANHARD AND LEVASSOR, of 14, Regent Street, and Acton Vale, W., these comprising three live axle models—10-15-h.p., 15-25-h.p., and 18-30-h.p.—and a chain-driven vehicle of 25-35-h.p. The motors are all of the four-cylinder type, the dimensions being respectively 80 mm. by 120 mm., 91 mm. by 131 mm., 100 mm. by 130 mm., and 110 mm. by 140 mm. Amongst the more important changes in the design may be mentioned the adoption of the high-tension direct spark magneto, this dispensing with the separate coil on the dashboard employed on previous models. A change has also been effected in the lubrication system, which is now operated by a small pump driven off one of the cam shafts. The pump is fed by gravity from a tank placed under the driving seat, the oil being forced through a pipe to two eight feeds on the dashboard and from thence distributed to the engine and gear-box. By this means a constant and regular lubrication is assured to both engine and gear. The appearance of the dash-

Fig. 42.—View of Chassis of the latest Live Axle Panhard Cars.

board is particularly "clean," as, with the exception of the two eight feeds previously mentioned, it is quite free from fittings. The novelty on the Panhard stand is, however, the chassis of the new 8-h.p. live axle model. The motor is of the two-cylinder type, with the valves all on one side. The magneto is carried in an accessible position, on a separate bracket. The engine control is by accelerator pedal, the steering wheel itself being quite free of any levers. The complete cars on view are all of the closed type, painted dark green, a particularly noticeable one being the six or seven-seated limousine on a 15-25-h.p. 9 ft. 6 in. wheelbase chassis.

The Armstrong Whitworth Cars.

Messrs. Sir W. G. ARMSTRONG, WHITWORTH AND CO., LTD., the well-known engineers and shipbuilders, are showing three vehicles—a 30-h.p. landaulet, an 18-22-h.p. chassis, and an 18-22-h.p. landaulet. The design of the 30-h.p. four-cylinder car is unchanged except in minor details from the 1908 model, which has proved extremely satisfactory. The 18-22-h.p. is an entirely new production for the coming season, and is an excellent example of modern automobile construction. The engine comprises four cylinders, 95 mm. by 120 mm. stroke, and although rated at only 18-22-h.p. it develops 27-h.p. at a speed of 1,300 revolutions per minute. The cylinders are cast separately, and have the valves on opposite sides. The ignition is by high-tension magneto, while the water circulation is by pump and honeycomb radiator. A pump operated from off the end of the exhaust cam shaft maintains a constant supply of lubricating oil to the engine bearings. The transmission is through a multiple plate clutch, four-speed gate-controlled gear-box, cardan shaft, and bevel gear to a live axle. The usual torque and radius rods are dispensed with, the torque of the back axle being taken by the propeller shaft casing. The live axle itself is so designed that by undoing eight nuts the differential gear can be lifted out, while the two halves of the axle may be withdrawn by simply removing the hub caps.

The Germain Cars.

The principal novelty at the stand of Captain Theo Masui is a chassis of the Germain new 20-h.p. six-cylinder car. The motor,

Fig. 43.—The Germain 28-h.p. Six-Cylinder Car with special Landaulet Body.

It will be noticed that there is hardly any leather at the rear of the side windows, which makes the interior of the car very light.

which has a bore and stroke of 86 mm. by 110 mm. stroke, comprises six separate steel cylinders, with brass water jackets; it is fitted with a Bosch high-tension magneto with automatic advance and retard. The carburettor is a special automatic one of the "Zenith" type, a description of which was given in the *Motor-Car Journal* of December 28th, 1907. The crank shaft is *desaxé*—that is, slightly out of line with the centre of the cylinders; the lubrication is effected by means of a worm-driven oil pump located in the lower half of the base chamber. The clutch is of a new metal-to-metal expanding type. A sectional view is given in Fig. 44, from which it will be seen that the new clutch runs on ball bearings. It is very much on the lines of a brake, a wide metal band expanding and contracting under the action of a cone, operated by the pedal and working between rollers mounted on levers connected with the band. The change-speed gear gives three speeds forward and reverse, and is controlled by a "gate" controlled lever. On the top speed the drive is direct. The chassis has been specially designed to be fitted with luxurious bodies for town use, the side members of the frame being lowered at the point where the side doors to the rear seats come, thus facilitating ingress and egress. A chassis of the Germain 28-h.p. four-cylinder car is also on view. Although similar in many respects to that introduced last year, various improvements have been introduced in the vehicle, thus bringing it thoroughly up to date. The bore and stroke of the engine is 120 mm. by 130 mm. This chassis can be supplied with either chain or cardan transmission, and comprises the following details:—Bosch high-tension magneto, automatic spark

advance, "Zenith" carburettor, three speeds forward and a reverse, positive lubrication by means of worm-driven oil pump, metal-to-metal clutch, "gate" change speed, direct drive on top speed, three-quarter elliptical springs, &c. The well-known Germain 18-h.p. light chainless car is also being shown. This vehicle can be supplied either with patent automatic "Zenith" or the Germain carburettor with variable lift to inlet valves. A noteworthy feature of the Germain cars is the entire absence of fittings on the radiator. Other exhibits at the

Fig. 44.—Sectional View of new Germain Metal-to-Metal Expanding Clutch.

Germain stand include a four-seated limousine by Van den Plas on an 18-h.p. chainless chassis and a double Royal phaeton fitted on a 14-h.p. chassis, which is identical to the 18-h.p., with the exception that the bore is 92 mm. instead of 102 mm., the stroke being 110 mm.

The Itala Cars.

The display of ITALA AUTOMOBILES, LTD., comprises a 45-h.p. chassis and a handsomely-finished limousine landaulet of similar power. As regards the mechanical details of the Itala vehicles, these remain practically the same as last year. The cylinders are cast in pairs, and the ignition is by low-tension magneto, the operating cams being located on the top of vertical rods which run up between each pair of cylinders. The throttle is controlled both by pedal and a hand lever on the steering wheel. The automatic carburettor is of the Itala Company's own design and construction, a notable feature being that the

Fig. 45.—Elevation and Plan of Germain 20-h.p. Six-Cylinder Car.

induction pipes are provided with expansion joints. The clutch is of the metal-to-metal type, using flat discs, and is very sweet in action. A large but light ring universal joint is fitted between the clutch and the gear-box to allow for any want of alignment between the two parts. The transmission from the four-speed gear-box is by a cardan shaft and bevel gear to a well-designed live axle. The cardan joints have metal cup protectors, and ball bearings are fitted throughout.

The Standard Cars.

A car which, under the ægis of Mr. Friswell, has gained considerable prominence during the season is the Standard, built by the STANDARD MOTOR CO., LTD. For 1909 attention is being devoted to two models—20-h.p. six-cylinder, and a 16-h.p. four-cylinder vehicle, the latter being a new model. Dealing first with the six-cylinder car, the cylinders are cast in pairs, with the valves arranged all on one side; the dimensions are $3\frac{1}{2}$ in. bore by $4\frac{1}{4}$ in. stroke. The bottom half of the base chamber can be detached without disturbing the crank shaft bearings. The ignition is by Simms-Bosch high-tension magneto gear, driven off the same shaft as the water pump. A feature of the automatic carburettor is the ease with which the various parts can be de-

Fig. 46.—Chassis of "Standard" 16-h.p. Four-Cylinder Car.

tached for inspection without the use of any tools. The lubrication of the engine is effected by a pump fixed to the lower half of the crank chamber and driven by skew gear off the cam shaft. The central portion of the base chamber is made in the form of a well. The pump forces the oil through a filter to an indicator on the dashboard, and to a distributor, whence it passes to the different bearings of the engine, the surplus oil running back to the well. The dashboard indicator is a useful yet simple fitting; it consists merely of a small piston and piston-rod, normally kept back in its guide by a light spiral spring. When oil is circulating through the pipes the piston-rod is forced past the outlet in the guide to the distributor, its end projecting about an inch beyond the face of the cap of the guide. Thus so long as the rod is projecting when the engine is running, the driver is assured that the lubrication is being maintained. The clutch is of the metal-to-metal type, consisting of a single plate held between the flywheel and a floating ring, provision being made for easy adjustment. The gear box is very compact, reducing the length of the shafts to a minimum. The three speeds and the reverse are controlled by a lever working in a "gate." On the top speed the drive is direct through a cardan shaft to the live axle. The universal joints are of special design. Ball bearings are used to all parts except the engine. The chassis is of such a length as to permit of a large and roomy closed or open side-entrance body to be fitted. Various improvements have been introduced in the details; for example, the ignition wiring is more neatly arranged, and shock absorbers are now fitted to both front and rear springs.

Fig. 46 gives a view of the chassis of the new 16-h.p. model, which in general lines closely resembles the "twenty." The engine comprises four cylinders of the same size as on the six-cylinder model, the carburettor and oil pump being also identical. For the water circulation, however, the pump has been discarded in favour of the thermo-syphon system. As regards the transmission, the principal change in this model is that a clutch of the leather-faced cone type is employed; a double universal joint is provided on the shaft which connects it with the gear-box. The latter gives three changes of speed, the third being a direct drive to the live axle. The Standard vehicles are British built throughout, and are noteworthy for their silent and smooth running, as well as for their moderate price. The complete cars on view include a limousine, built to the order of Mr. Marshall Hall, K.C.; a collapsible coupé, of novel design, for Her Highness Princess Toussoun; and a standard side-entrance double phaeton.

The Vulcan Cars.

The VULCAN MOTOR COMPANY, LTD., Southport, have an excellent display of moderately-priced cars, ranging from 14-h.p. to 25-30-h.p., all fitted with four-cylinder engines. The 16-h.p. car is the company's latest production, and will well repay inspection. The engine has the cylinders cast in pairs, the bore and stroke being $3\frac{1}{2}$ in. by $4\frac{1}{4}$ in. The valves are arranged on opposite sides, operated off separate cam shafts,

and there are two systems of ignition—magneto and accumulators, both working through a synchronised distributor. A feature in connection with the ignition is seen in the means adopted for starting the engine on the switch. To this end, the distributor is arranged to move through a longer distance than usual, a quick to-and-fro movement of the ignition-lever on the steering wheel resulting in the firing of the charge in the cylinder, the piston of which has already commenced its downward stroke. The carburettor is of the automatic type, and comprises a new feature to keep the engine running steadily when working light—that is to say, when it is not driving the vehicle. When throttled down for this purpose, the mixture is entirely drawn through a small hole in the throttle. In front of the hole is a tongue piece like the reed of a motor-horn, so arranged that should the engine tend to race, the reed is, by the suction of the engine, attracted to the wall of the throttle, so covering the hole and stopping the supply of mixture. The engine is lubricated by a plunger pump worked off one of the cam shafts, a feature of the Vulcan system being that oil that has once been used is not again fed to the bearings, as is usual in other methods where the oil from the sump is pumped round and round. The big ends of the connecting rods dip into troughs in the base chamber, which hold just sufficient oil. The arrangement is such that all the oil is pumped to distributors on the dashboard; these are provided with regulating devices so that only the requisite supply is sent to the engine, any surplus which reaches the distributor passing directly back to the oil tank. The clutch is of the leather-faced cone type, and the gear-box, which is controlled by a lever working in a "gate," is adapted to give three speeds forward and a reverse, with direct drive on the third speed. The transmission is by a cardan shaft and bevel gear to a rear live axle. The latter has only the driving strain to withstand, the weight of the car being carried by the axle sleeve. The power is communicated to the hubs of the rear road wheels by dog clutches on the ends of the live shafts. The details of the vehicle are all on modern lines; for instance, a joint is provided between the clutch and gear-box to allow for any want of alignment between the two parts, and also to enable either to be dismantled without disturbing the other. A new point in connection with the universal joints of the cardan shaft is that the old leather grease-containing covers have been discarded in favour of a metal cap held up to its place by a light spring. The engine is

Fig. 47.—Chassis of Vulcan 16-h.p. Four-Cylinder Car.

provided with both foot and hand control, and the car is adapted to receive any type of carriage body. We may add that ball-bearings are used to all parts except the motor. The 14-h.p. Vulcan differs in but few respects from the 16-h.p.; the cylinder dimensions are $3\frac{1}{2}$ in. bore by $4\frac{1}{4}$ in. stroke. The complete cars on view include a 14-h.p. double phaeton, a 16-h.p. side-entrance touring car of special design, and a 25-30-h.p. landaulet. In the Vulcan cars the construction is such that each part of the transmission can be taken down without disturbing any of its neighbours. Altogether, the vehicles bear evidence of careful and well-thought-out design, and their moderate price should bring them many purchasers.

The Brooke Cars.

Messrs. J. W. BROOKE AND CO., LTD., Lowestoft, display examples of their two sizes of six-cylinder cars—viz., 25-h.p. and 40-h.p. These are of the live axle type, and while showing no startling deviation from the 1908 models, have been brought well up to date. The foot

brakes are now of the contracting type, in place of the internal expanding variety hitherto employed, while on the 25-h.p. model a forced system of engine lubrication has been adopted, the oil, which is contained in a sump in the crank chamber, being circulated by means of a pump driven by skew gear off one of the cam shafts.

The Mercedes Cars.

Admirers of the Mercedes cars—and they are many—will regret to find these well-known cars relegated to the Annex, especially as the exhibit is a noteworthy one in so far that the makers of the Mercedes vehicles, who have so long adhered to chain driving, are now turning out live-axle machines. Although the new 35-h.p. model (Fig. 48) made its appearance about the middle of the past season, it is now shown to the public for the first time on the stand of Messrs. DU CROS MERCEDES, LTD. Although a late comer, as it were, in the field of live-axle cars, the design of the new vehicle is such as to make an excellent impression at the first glance. The engine is of the usual Mercedes design; the bore and stroke being 110 mm. by 140 mm. The ignition is by low-tension magneto in conjunction with the Bosch magnetic plugs, which have already been illustrated in the *M.C.J.* A clutch of the multiple-disc type is employed in place of the coil pattern previously used in Mercedes practice. The gate-controlled gear-box is designed to give four speeds with direct drive on the top. The cardan shaft is entirely enclosed in a sleeve, which at its forward end terminates in a spherically-shaped casing, surrounding the universal joint, and independently supported on the frame. The sleeve thus acts as the torque rod, while the radius rods extend from the ends of the axle sleeve to

in one block. Simms-Bosch high-tension magneto only is fitted, while the carburettor is of a special type, differing from the 1908 model in that it has two jets, each being in a separate compartment and supplying one group of the cylinders. The clutch is of the multiple-disc type, with a cone clutch brake, the whole being contained in an oil-tight aluminium casing. The back axle is of the same design as used on the 1908 cars, except that it has been reduced in size in order to save weight. The rear suspension is by the La Buire patent double elliptic springs. A 24-h.p. polished chassis, fitted with a six-cylinder engine, (92 mm. bore by 120 mm. stroke) is also on view. The design of the engine, carburettor, gear arrangement, clutch, back axle and suspension are exactly the same as on the 16-h.p. chassis mentioned above. Another car to be seen is an 18-h.p. chassis, with rotund side entrance body. The latter has been designed to give the greatest possible comfort and at the same time decrease the weight and wind resistance. The chassis is fitted with a four-cylinder engine, bore 100 mm., stroke 130 mm., the cylinders being cast in pairs.

The Miesse Petrol Cars.

Two models of the Miesse petrol cars are staged by the MIESSE PETROL CAR SYNDICATE, LTD., Pelham Street, South Kensington, W.—viz., 14-16-h.p. and 24-30-h.p. The feature of these vehicles is the casting of the four cylinders together with the admission and exhaust pipes in one casting. The 14-16-h.p. engine has a bore of 80 mm. by 110 mm. stroke; the valves are located on opposite sides, while the high-tension magneto and water circulating pump are driven by worm-gearing. The carburettor is of the Zenith automatic type, of which a description has

Fig. 48.—Plan of Chassis of Mercedes 35-h.p. Live Axle Car.

the spherical box. The differential gear is not mounted on the rear axle as is usual, but on a continuation of the bevel pinion shaft. The two halves of the live axle are thus driven through separate pairs of bevel wheels. The arrangement enables the live axle to be arched and the rear road wheels splayed as in chain-driven vehicles. A 15-20-h.p. car on similar lines is also being introduced for the 1909 season. Of the 45-h.p. chain-driven cars, a handsome limousine is shown with body, work by Lawtons. The engine has the valves arranged on opposite sides; the carburettor is of the piston throttle automatic type, while the ignition is by means of the Bosch "candle" or magnetic plugs. The side driving chains are enclosed in gear-cases.

The La Buire Cars.

The HOLLINGDRAKE AUTOMOBILE CO., LTD., the British agents for the La Buire cars, introduce two new models for the 1909 season. The first is a light 12-h.p. vehicle, designed for use as a private town carriage or for country station work. The engine comprises four cylinders cast in one block, the inlet and exhaust valves being on opposite sides. The ignition is by Simms-Bosch high-tension magneto, the La Buire patent carburettor being also fitted. A noteworthy feature of the chassis is that the clutch, brake, and gate-controlled change-speed gear are all contained in the same casing. The back axle is of a patent bridged type, and is of the same design as fitted to the other models mentioned below. A good deal of interest is being shown in the second new model, a 16-h.p. six-cylinder vehicle, of which a chassis is shown. This is being built with two different types of frames, one being under-swept at the back for landaulets, &c., and with the ordinary type of straight frame up-swept at the rear for touring car purposes. The engine, which has a bore of 80 mm. and a stroke of 120 mm., is similar in design to the other six-cylinder models, three cylinders being cast

already been given in the *M.C.J.* The transmission is through a clutch of the Hele-Shaw type, with corrugated discs, and three-speed gear-box, giving a direct drive on the top speed to the live axle. Ball-bearings are used to all parts except the engine. The 24-30-h.p. car has an engine comprising four cylinders, 110 mm. bore by 120 mm. stroke. The crank shaft, which is of nickel steel, has five bearings. The lubrication is maintained by a pump, which forces the oil to all the main bearings and connecting rods. All the gears on the cam and engine shafts are enclosed in a dust-proof case. The ignition is by a Simms-Bosch high-tension magneto, while the carburettor is of the Miesse special design, with gravity feed, and automatic air regulator. The clutch is of the multiple-disc type, running in oil, the change-speed gear is adapted to give three speeds with direct drive on top speed. The final drive is by a cardan shaft and bevel gear. The universal joints are of new design, and are provided with dust-tight grease cups. The back axle is of a strong design; it runs on large-diameter ball-bearings, ball-thrust bearings being also fitted to take the thrust of the wheels.

The Werner Cars.

MESSRS. BURGESS AND HARVEY, LTD., who have acquired the British agency for the Werner light cars, are showing a couple of the latest examples of the 9-h.p. type. The motive power is supplied by a De Dion single-cylinder engine, 100 mm. bore by 130 mm. stroke, fitted with improved carburettor and Bosch high-tension magneto ignition. The water circulation is on the thermo-siphon system. The transmission is through a special pattern of leather-faced cone clutch, and three-speed gear-box to a live axle. The vehicle, which is fitted with a two-seated body, has a neat appearance and, judging from the details, should prove a reliable little machine.

The Pilgrim Cars.

A new car of exceedingly novel design is the 9-h.p. "Pilgrim," exhibited by the PILGRIM'S WAY MOTOR COMPANY, LTD. The vehicle is fitted with a horizontal two-cylinder opposed air-cooled engine, $3\frac{1}{2}$ in. bore by 3 in. stroke, developing according to the R.A.C. rating 9-h.p.; the main feature of the design is that the power of the engine is transmitted to the front steering wheels through an epicyclic change-speed gear, giving three forward speeds in addition to the reverse; the front wheels thus support the whole of the weight of the engine and gear, the rear pair having only to carry the weight of the passengers. The car, which is provided with a two-seated runabout body, is mounted on 30-in. wire-spoked wheels of the detachable type, so that when a spare one is carried, and a puncture is experienced, a

Fig. 49.—Sectional View of Engine, Change-Speed Gear and Front Axle of Pilgrim Two-Seated Car.

| | | |
|-----------------------|-------------------|-----------------|
| A.—Crankshaft. | D.—Gear-box. | G.—Bevel wheel. |
| B.—Base chamber. | E.—Driving shaft. | H.—Front axle. |
| C.—Shaft to gear-box. | F.—Bevel pinion. | |

complete new wheel and tyre can quickly be fitted in position. Another new departure is seen in the fitting of brakes on all four road wheels. The car, which has a wheel base of 7 ft., weighs, complete, only 6 cwt. The company is also showing one of their standard 32.4-h.p. (R.A.C. rating) "Pilgrim" chassis, with a three-quarter landaulet body of improved design; it is made with the rear seat wide enough to seat three persons, and well forward of the back axle, which, together with its easy springing, make it an exceedingly comfortable carriage. The engine, which is mounted in the centre of the frame, comprises four horizontal cylinders all located on the same side of the crank shaft. The cylinders, which are $4\frac{1}{2}$ -in. bore by 5-in. stroke, are cast separately but complete with water-jacket. The cam shaft is arranged so that it can be quickly detached, while the large inspection doors fitted to the crank chamber enable a piston to be withdrawn without it being necessary to dismantle the engine. The lubrication is effected by a valveless or oscillating pump located in the crank case, which forces the oil from the base chamber through a distributor to the different bearings, the oil returning to the tank to be repumped. The transmission is through an epicyclic type of change-speed gear, which runs on ball-bearings, and the pinions of which are all externally cut. The gears are automatically operated by one pedal and an indication lever, which can be set at any time to the gear required. By this means a depression of the pedal instantly brings the proper gear into use without any cessation in the pull of the engine on the car. The final drive is by a single central chain, which is enclosed.

The Stanley Steam Cars.

The number of steam cars on view is this year increased by those of the Stanley type, which are exhibited at Olympia for the first time by Messrs. W. GALLOWAY AND CO., of Gateshead, who have now a London depot at 13, West Street, Shaftesbury Avenue, W.C. Without finding it necessary to change the general system, the makers of the vehicles have introduced a number of detail alterations. In the first place the method of working the pumps has been largely altered for 1909; the former method, simple though it was, employed a considerable number of working and wearing parts in the shape of levers and links; these have been reduced in the new models to one quarter of the number, the whole being worked by one pair of strong links. A great saving of space is at the same time effected, the whole system of pumping water, fuel, and oil being now more compact and accessible. The copper engine cover is provided with inspection doors; and the lubrication of the running parts of the engine being now effected with otherwise waste cylinder oil after passing through the cylinders, it will seldom be necessary to remove the engine cover itself. The 10-h.p. car will perhaps be the most popular, providing at a popular price a noteworthy combination of comfort and power with absolute simplicity of control. The wheel base of this model has been lengthened, and the

incline of the steering column increased, adding greatly to the comfort of the driver and making the whole car ride more easily. In the body design alternatives are offered to purchasers of a luggage platform or single or double rumble seat at the back. Examples of the 20-h.p. four-seated double phaeton and a speedy 20-h.p. two-seater are also on view.

The Ford Cars.

Messrs. PERRY, THORNTON AND SCHREIBER, LTD., display examples of the latest models of the Ford 15-h.p. and 20-24-h.p. four-cylinder cars. The 15-h.p. shows very little change from last year. The 20-24-h.p. is a new model, in which the four cylinders, $3\frac{1}{2}$ in. bore by 4 in. stroke, are cast in one piece, with the valves arranged all on one side. The ignition is by low tension magneto, while the carburettor is of a special automatic float-feed type. The transmission is through a planetary or epicyclic type of gear-box and cardan shaft to a live axle. The suspension of this vehicle is on exceedingly novel lines, there being only two springs, both arranged transversely, one at the front and the other at the rear of the frame. The Ford cars are notable for the low prices at which they are put on the market, this being, it is claimed, only rendered possible by the absolute standardisation of the various parts and the very large outputs of cars, stated to be 25,000 per annum, from the Ford factory.

The Sheffield Simplex Cars.

We referred last week to the new features of the chassis of the Sheffield Simplex 45-h.p. six-cylinder car. A brief reference may be made to the complete cars on view, and particularly to what may be termed as a double limousine. The whole of this body, which was built by Messrs. Sir WM. ANGUS, SANDERSON AND CO., Newcastle-on-Tyne, is covered in, driver's seat included, while inside is a special arrangement whereby a bed can be pulled out so that the owner can lie comfortably at full length inside the car. This car is painted in a very conspicuous canary colour and upholstered in dark grey cloth, relieved by gold lace. Another Angus-Sanderson body on this stand is a two-seater of a novel design. The rear seat is made to fold up, so when out of sight the back portion looks like a large tool-box. When open, however, the seat is particularly comfortable and is well adapted for a servant, leaving plenty of room for luggage in front of his feet, for touring.

The Electric Vehicle Co.

An attempt is being made to popularise electric motor-cars by the ELECTRIC VEHICLE CO., LTD., who have on view an elegant victoria (Fig. 50), with folding spare seat at the rear. Outwardly the vehicle follows the general appearance of a petrol car, the space under the bonnet serving to accommodate thirty of the forty Tudor accumulators which supply the energy to drive the car, the remainder being carried at the rear. The battery, which weighs about 11 cwt., has a capacity of 200 amp.-hours at a five hours' discharge rate. The motor, which is located at about the centre of the frame, is of the series wound

Fig. 50.—The Electrical Vehicle Company's Victoria.

type, and drives the rear live axle through a cardan shaft and worm gear. The controller, which is connected up to both the battery and the motor, is arranged to give nine forward and three reverse speeds: it is actuated by a lever on the steering wheel. The makers claim that the car can run a distance of from 80 to 100 miles on one charge, at an average speed of eighteen miles per hour, and that it is consequently well suited for touring purposes. We understand that the Tudor Co. are prepared to maintain the battery in perfect condition for £25 per annum. The car has an attractive appearance, and on account of its quiet and easy running will doubtless meet with the approval of many motorists.

The Rover Cars.

For the 1909 season the ROVER COMPANY, LTD., Coventry, are turning out no less than five models—viz., 6-h.p., 8-h.p., 12-h.p., 15-h.p., and 20-h.p. Except for detail improvements the 6-h.p. and 8-h.p. models, which are fitted with single-cylinder engines, remain on similar lines to those of the past year. The 12-h.p. car is fitted with a two-cylinder engine and three-speed gear-box, and is designed to receive a four-seated touring body, access to the rear seats being obtained by swinging round half of the front seat. The novelty at the stand in the new Rover 15-h.p. car (Fig. 52), which has many points of interest. The cylinders of the four-cylinder engine (85 mm. bore by 110 mm. stroke) are cast in pairs, with the valves all on one side. With the view of rendering the motor as quiet as possible, the valve

Fig. 51.—The Change-Speed Gear Quadrant for the Rover 8-h.p. and 20-h.p. Cars.

stems and tappet guides are enclosed by large detachable plates. Ignition is by coil and accumulators, provision being also made for the installation of a magneto; the lubrication is controlled by a pump, which forces the oil to all the main bearings. A feature of the motor is that it is designed to be used as a brake in descending steep hills. The cam shaft is of special design, and, in addition to lifting the inlet and exhaust valves in the usual way, is so constructed that it can be used to effect an engine or compression brake. By moving the cam shaft in a longitudinal direction by means of a pedal, the inlet valves are kept closed, while the exhaust valves are lifted twice to every revolution of the shaft, with the result that air is taken in from the exhaust pipe on every downward movement of the piston, compressed on the upward stroke, and then exhausted. The inlet valve being permanently closed, no gas is admitted to the combustion chamber, with the result that the engine is working under compression, which effectually retards its

tion to the ordinary slots corresponding with the respective gears, a stop is placed on the opposite side of the quadrant in order to prevent the incautious driver passing the desired gear. The lever itself is hinged near its fulcrum, and provided with a coil spring, the latter holding the lever to the gear notches. The slightest pressure sideways is sufficient to overcome the spring, when the lever can be moved along until arrested by the stop, when it automatically slips into the gear notch required.

The Alldays Cars.

Three different sizes of the Alldays cars are exhibited by Messrs. ALLDAYS AND ONIONS, Birmingham—viz., 10-h.p. two-cylinder and 14-h.p. and 20-h.p. four-cylinder. Of the first-named type of cars both two-seated and four-seated bodies are on view, the former being well adapted for the use of doctors and other professional men. A special two-seated car is also shown fitted with a four-speed gear-box, in which the direct drive is on the third speed; the control is by a single lever working in a "gate." The 14-h.p. car is fitted with a roomy side-entrance body, having accommodation for five persons, while the 20-h.p. landaulet is also a striking vehicle. As regards the changes in the mechanical portion of the chassis of the Alldays cars for the coming season, these are to a large extent confined to details. It may be mentioned, however, that all the different types are now being fitted with a gear-driven pump for the lubrication of the engines. Improvements have also been introduced in connection with the ignition contact-maker, while a useful fitting is a small lever near the starting-handle for flooding the carburettor.

The Sizaire-Naudin Cars.

The marvellous speed attained during several of the leading racing events of the past year has brought the little Sizaire-Naudin voiturettes into greater prominence than ever, the three vehicles exhibited by Messrs. JARROTT AND LETTS, LTD., the British agents, having been the centre of attraction throughout the week. The cars on view include a standard two-seater, a special two-seated touring car, with hood, glass screen, side doors, luggage platform, &c., and a standard four-seated car. The motive power of these machines is supplied by a 12-h.p. single-cylinder engine, 120 mm. by 130 mm. stroke. The carburettor is of the automatic float-feed type, and is so arranged that it can be dismantled by simply undoing one nut. The jet can also be readily taken out. An ingenious fitting is a button-ended rod which projects through the radiator and enables the air supply to the carburettor to

Fig. 52.—Chassis of Rover 15-h.p. Car.

movement, and at the same time it is being cooled. The arrangement has proved so effective in practice that it is claimed to be sufficient to hold the car, when the low speed is engaged, on almost any hill. The engine and gear-box are bolted together to form a unit. The clutch is of the Rover plate type, with easy means of adjustment. The gear-box is adapted to give three speeds, with direct drive on the top to the rear axle, to the design of which special care has been directed. The frame is supported on four semi-elliptic springs. The 20-h.p. car, which has a three-point suspension, shows but little change from last year. Fig. 51 shows the change speed quadrant, now employed on this model, as also on the 8-h.p. Rover. It will be seen that, in addi-

tion to the ordinary slots corresponding with the respective gears, a stop is placed on the opposite side of the quadrant in order to prevent the incautious driver passing the desired gear. The lever itself is hinged near its fulcrum, and provided with a coil spring, the latter holding the lever to the gear notches. The slightest pressure sideways is sufficient to overcome the spring, when the lever can be moved along until arrested by the stop, when it automatically slips into the gear notch required.

be shut off when starting up the engine. The ignition is by Bosch high-tension magneto, provision being made for a supplementary accumulator and coil system. The water circulation is on the thermosiphon principle, a circular horizontal water tank being fixed behind the radiator as a supplement to the latter. Transmission is through a single metallic-disc clutch and a special form of three-speed gear-box, giving a direct drive on all speeds. The change-speed mechanism forms a forward extension of the back axle casing, a new departure being the fitting of ball-bearings. The four-seated car has a slightly longer frame than the two-seater, semi-elliptical springs being also fitted at the rear instead of the customary Sizaire suspension.

The Renault Cars.

As usual, the display of Messrs. RENAULT FRÈRES is attracting considerable attention; the exhibit comprises examples of the 10-14-h.p., 14-20-h.p., 20-30-h.p., 35-45-h.p. four-cylinder cars, and one of the 50-60-h.p. six-cylinder vehicles, with Berlin limousine body arranged to be driven from the inside. So far as the details of the mechanism are concerned, these show very little change. The larger cars are provided with a self-starting device on the Saurer system, and shock absorbers of special design are fitted in connection with the springs, which are of the semi-elliptic pattern at the front and three-

FIG. 53.—The Renault 8-h.p. Voiturette.

quarter-elliptic at the rear. For the 1909 season the Renault firm have brought out a new 8-h.p. voiturette (Fig. 53), which has met with much appreciation. The new vehicle follows in general arrangement very much on the lines of the Renault taxi-cab. The engine is of the two-cylinder type, 75 mm. bore by 120 mm. stroke. Ignition is by high-tension magneto, and, as in all Renault cars, the water circulation is by thermo-syphon in conjunction with a radiator fixed just in front of the dashboard. The transmission is through the usual leather-faced cone clutch and three-speed gear-box, giving a direct drive on the top to the rear live axle.

The Phoenix Cars.

A concern which makes its *début* at Olympia is PHOENIX MOTORS, LTD., of Blundell Street, London, N., who are showing examples of the Phoenix 8-h.p. and 10-12-h.p. cars. No alteration has been made in the 8-h.p. two-seater car (Fig. 54), the outstanding features of which are its moderate first cost and nominal upkeep. Briefly, the car is fitted with an 8-h.p. two-cylinder engine, which drives by means of Renold chain straight through to the epicyclic change-speed gear, whence the power is again transmitted by a similar chain to the back axle. On the

FIG. 54.—The Phoenix 8-h.p. Twin-Cylinder Car.

high speed the epicyclic gear is locked, and, this running on a ball-bearing countershaft, gives a straight through drive from engine to road wheels. The clutch is of the multiple plate type running in oil. Interest is being centred in the 10-12-h.p. car (Fig. 55), which the company have this year placed upon the market after twelve months' tests. The new model, which is provided with a four-seated body, is equipped with a two-cylinder engine, 90 mm. bore by 100 mm. stroke. The water circulation is by thermo syphon, ample radiating space being provided, obviating the necessity of a pump. The gravity supply petrol tank, which forms part of the dash, is provided with a gauge glass showing at a glance the amount of petrol in the tank. The clutch

is combined with the flywheel and is of the single plate type. The drive is taken by a Renold silent non-stretching chain from the engine to the ball-bearing three speed and reverse gear-box, the teeth of the pinions of which are no less than six pitch, giving an immense margin of strength. The drive is again taken from the gear by means of a similar chain to the rear live axle, the transmission being thus entirely by parallel shafts. Large internal metal-to-metal expanding brakes are fitted to the driving wheels, while a further brake operates on the drum of the differential. Hoffman ball-bearings are fitted to all running parts.

The Nagant-Hobson and Decauville Cars.

Three sizes of the Nagant-Hobson vehicles are displayed by Messrs. H. M. Hobson, LTD.—viz., 14-18-h.p., 20-30-h.p., and 35-40-h.p.—all fitted with four-cylinder engines. The 14-18-h.p. car is a new live axle model; the motor (90 mm. bore by 110 mm. stroke) is provided with mechanical lubrication, high-tension magneto ignition, and thermo-syphon water circulation. The crank shaft is slightly *desaxé*—that is, out of line with the centre of the cylinders, this being done to get a more vertical thrust on the explosion stroke. The clutch is of the multiple disc type, and the three-speed gear-box gives a direct drive on the top speed through the cardan shaft and bevel gear to the live axle. The 20-30-h.p. car (106 mm. bore by 130 mm. stroke) differs from the above in that it is fitted with two systems of ignition—low-tension magneto and coil and accumulators. The gate-controlled gear-box gives four speeds, and the final drive is by side chains. The car on view is fitted with an attractive form of five-seated landaulet body, and arranged to be driven from the inside. The largest-powered Nagant-Hobson chain-driven car is a 35-40-h.p., with special coupé-landaulet body, by Kellner, of Paris. The engine comprises four cylinders, 125 mm. bore by 140 mm. stroke, cast in two pairs, with

FIG. 55.—The Phoenix 10-12-h.p. Chassis.

the valves arranged on opposite sides. The ignition is by low-tension magneto, coil and accumulators being installed as a reserve. Turning now to the Decauville cars, two examples of these are to be seen. The first is a 12-16-h.p. four-cylinder side-entrance car. The engine is fitted with mechanical forced feed lubrication and both high-tension magneto and accumulator ignition. The transmission is through a leather-faced cone clutch, three-speed gear-box and cardan shaft to the Decauville standard live axle. The change-speed lever works in a push-through quadrant of new design, giving a positive stop against each speed, so that it is impossible to overrun the desired notch. A foot brake of the internal-expanding type has been adopted, and the rear part of the frame is now supported on three-quarter elliptic springs. The 16-20-h.p. car shown is very similar in general arrangement to the 12-16-h.p. car mentioned above.

The Deasy Cars.

The chief new departure on the part of the DEASY MOTOR-CAR MANUFACTURING COMPANY, LTD., is the introduction of a 15-h.p. four-cylinder car. The engine, which has a bore and stroke of 90 mm. by 120 mm., has all the four cylinders in one casting; the valves are operated off a single cam shaft, while the crank shaft rotates on ball bearings. The transmission is through a three-speed gear-box and bevel gear to a live axle. The sleeve surrounding the latter is of an entirely new design, being made of solid-drawn tubes, the flanges and casing for the ball bearings all being drawn in one piece. The Deasy 25-h.p. and 35-h.p. cars remain very much the same as in the 1908 models, the improvements being confined to details. The company's exhibit consists of a chassis of the new 15-h.p. type and one of the same power fitted with a landaulet body; a 25-h.p. touring car with Cape cart hood and windscreen; and a 35-h.p. cabriolet similar to the one recently supplied to Lord Fitzhardinge.

The B.S.A. Cars.

A new model of the B.S.A. cars for the coming year is a 14-18-h.p. vehicle, based on the same lines as the company's 18-23-h.p. machine. The engine comprises four cylinders, 90 mm. bore by 100 mm. stroke. They are cast in pairs, with the valves operated off a single cam shaft. The ignition is by high-tension magneto, and the water circulation is by thermo-syphon, no pump being employed. The transmission is through a leather-faced cone clutch, gate controlled three-speed gear-box and propeller shaft to a live-axle. A feature of the steering gear, which is made under the B.S.A. patent, is that all

Fig. 56.—Chassis of the B.S.A. 18-23-h.p. Car.

the joints are by solid connections consisting of forked pieces and studs.

The 18-23-h.p. car (Fig. 56) is very similar to the 1908 model, the only alterations being that the frame is now pressed with the inner and outer members in one piece, while the wheel base has been increased from 9 ft. to 9 ft. 6 in., which gives more room for a side entrance body, with wide door, and will also be found very suitable for a roomy single landaulet body, with luggage extension and screen, and in every instance the engine has been found to have ample power for the load. The motor (98 mm. bore by 120 mm. stroke) remains exactly the same as last season, as also the disc clutch, gear-box and axles.

A new type of automatic carburettor has been fitted, which, whilst giving slow running, is claimed to afford a remarkably quick pick-up, with no tendency, even if the car has been running continuously in traffic, for the engine to choke. It is entirely automatic and free from any delicate adjustment or parts likely to cause trouble through wear.

The 25-33-h.p. car (bore 115 mm., stroke 130 mm.) is exactly the same as last year, with the following exceptions:—An improved automatic air valve to the carburettor; balanced differential brake (locomotive type), and a modified form of clutch of the multiple disc pattern, the plates being larger in diameter and of the different type as used on the 18-23-h.p. car. The details of the different models all bear signs of careful design and construction; accessibility has not been neglected, while provision is made for the rapid adjustment of the brakes and other components which may occasionally require such attention. Briefly, it may be said that the Birmingham Small Arms Co. mean that their cars shall earn as high a reputation as that enjoyed by their cycle productions.

The "F.N." Cars.

Among the cars of Belgian construction which have created a favourable impression since their introduction into this country are the "F.N.," built by the FABRIQUE NATIONALE D'ARMES. Two models are shown by the "F.N." Motor Agency on the stand of the Gobron-Brillie Co. Quite a new model is seen in an 8-12-h.p. chassis, designed to receive a side-entrance body. The motive power is supplied by a four-cylinder engine, 72 mm. bore by 90 mm. stroke, having the valves arranged on opposite sides and the crank shaft slightly *desaxé*. The water circulation is on the thermo-syphon system, while the lubrication is maintained by a small pump. The ignition is by high-tension magneto. The transmission is through a leather-faced cone clutch, gate-controlled three-speed gear-box and cardan shaft, to a live axle. Ball bearings are used to all parts except the engine. The control of the engine is by a single lever; the clutch pedal is, however, also so connected with the throttle that as the clutch is withdrawn the speed of the engine is cut down. Every attention appears to have been paid to the question of accessibility, while the matter of easy adjustment has not been overlooked. In this connection it may be mentioned that provision is made for adjusting the clutch and brake

pedal to suit different drivers. The "F.N." 14-16-h.p. car shows a few detail changes from the model which has already been described in these pages. The engine in this case is provided with a gear pump for the water circulation. The three-speed gear gives a direct drive on the top speed to the live axle, the lay or secondary shaft in the gear-box being then idle.

The Maudslay Cars.

Several very fine examples of these cars are to be seen at the stand of the MAUDSLAY MOTOR Co., LTD., Coventry, including a 25-30-h.p. live-axle vehicle, with landaulet body by Thorn; a 35-45-h.p. live-axle machine, with limousine body by Lawton; and a 35-45-h.p. chain-driven machine, with extended landaulet body by McNaughts. In order that the details of the Maudslay construction—one of the great features of which is the accessibility of the various parts—may be inspected, a polished chassis of the 25-30-h.p. live-axle model is also shown. Generally speaking the design has undergone but little change; a few detail improvements have been introduced, such as, for example, arranging the throttle and ignition control-lever section so that it does not move with the steering wheel.

A change has also been made as regards the brakes. Instead of both the brakes being contained in a drum mounted on the rear road wheels, as hitherto, the whole of this drum is now given up to the hand-controlled brakes, the foot brake acting on a drum mounted on the propeller shaft immediately behind the gear-box.

The engine is of the special design associated with the Maudslay Co., comprising four cylinders cast in pairs, with the valves all located directly in the cylinder heads, they being operated off an overhead cam shaft, which in its turn is actuated by a vertical spindle driven through gearing at the forward end of the crank shaft. The cam shaft is pivoted so that by loosening the retaining bolts it can be swung clear of the valves, allowing any of the latter, together with their springs and seatings, to be instantly removed. The base chamber is provided with detachable doors of such a size that not only can the crank shaft and big end bearings be readily inspected, but, if occasion arises, a complete piston and connecting rod can be withdrawn without it being necessary to dismantle the engine. With a view of furnishing a long cardan shaft so that the acuteness of the angle between the rear of the gear-box and the differential casing shall be reduced to a minimum, the gear-box itself is located close up to the clutch. The live-axle construction is of an interesting design. The axle sleeves and differential casing are all in one piece, and made from a single forging. The latter is first slit in the middle, and is then drifted out

Fig. 57.—The Maudslay 35-45-h.p. Live Axle Phaeton specially built for a 12,000 miles tour Mr. G. Cecil Gaapp, the London manager of the company, is about to make through India and Ceylon.

A clearance of 12 in. is given from the ground and special arrangements have been made for extra radiation and carburettor adjustment. The body is upholstered in raton and the front seats are made to fall back and join up with the back seat, thus forming two 6 ft. beds. The vehicle is fitted with Shrewsbury Challiner rims, Avon tyres, Eloriot lamps, and the coachwork is by Messrs. Thorn.

to form a loop or bridle which can accommodate the driving and differential mechanism. The extremities are afterwards machined to circular form and bored through to accommodate the live shafts. The front and rear sides of the loop in which the differential is supported are closed by two light aluminium dished covers. By detaching the rear one and by removing the hub caps and slightly withdrawing the live shafts, the bevel pinions and the differential gear can be lifted out, enabling these parts to be readily inspected or the gear ratio changed without difficulty.

The S.K. Simplex Car.

The new "S.K. Simplex" light car, made by Messrs. SMEDLEY AND KENNEDY, LTD., Newcastle-on-Tyne, makes its first public appearance at the London Show, and, in view of its many interesting features, has attracted a large amount of attention during the present Olympia week. An illustrated description of the vehicle was given in the *M.C.J.* of May 30th last, but as several improvements and modifications have since been incorporated, the following particulars will be of interest. The frame, which is of pressed steel, is supported on three springs—a single transverse semi-elliptic at the front, and two long flat springs at the

Fig. 58.—Part Sectional Plan of Gear-Box and Back Axle of S.K. Simplex Car.

rear. Four radius rods are also provided—two from the front axle and two from the back axle—these converging towards two central brackets. The motive power is supplied by an 8-10-h.p. two-cylinder engine, $3\frac{1}{2}$ -in. bore by $4\frac{1}{2}$ -in. stroke, the valves are actuated by an overhead cam shaft, the latter being driven by bevel gear and a vertical spindle. The cam shaft, which runs on ball-bearings, is enclosed in an aluminium casing; the latter is attached to the top of the cylinder casting in such a way that it may be instantly removed by slackening the hinged wing nuts. A point of interest is that both pistons are set to rise and fall together, thus giving a steady torque; the difficulty of balancing is got over by employing two heavy internal flywheels in addition to the external one.

Fig. 60.—Chassis of S.K. Simplex 8-10-h.p. Car.

The water circulation is on the thermo-syphon system, no pump being employed. The cooling effect of the radiator is assisted by a fan formed in the engine flywheel. The ignition is by high-tension magneto, while the mixture is furnished by an automatic carburettor, this being bolted direct on to the cylinders. Passing now to the transmission, a clutch of the internal expanding metal-to-metal type is employed; the expansion is effected by a sliding cone, which allows of the use of a light clutch spring. The drive is conveyed by a cardan shaft to a combined gear-box and back axle (Fig. 58), which are fitted with ball-bearings throughout. Three speeds and a reverse are controlled through a "gate"

type of quadrant. Only a single selecting rod is used to obtain the various speeds. The torque is taken through a torque tube on to a ball-bearing mounted on the cardan shaft close up to the universal joint. The brakes are of the internal-expanding type. The makers prefer to take all braking strains at the point where they are required—viz., at the road wheels, both the foot and hand brakes working in drums attached to the rear road wheels (Fig. 58). The car is being supplied with a comfortable two-seated body (Fig. 59); the wheel base is 7 ft. 6 in., and the 760 mm. road wheels are shod with 90 mm. tyres. Altogether the new "S.K. Simplex" car is a noteworthy addition to the list of high-grade vehicles at a popular price.

The Gobron-Brillié Cars.

Some fine examples of the Gobron-Brillié cars are shown by the GOBRON-BRILLIÉ Co., including a 70-90-h.p. six-cylinder vehicle, and a 40-60-h.p. four-cylinder seven-seated limousine, the latter being one

Fig. 59.—The S.K. Simplex 8-10-h.p. Two-Seated Car.

of the most highly-finished cars in the show. It will be remembered that the engine of these cars differs from the usual design in that there are two pistons in each cylinder, they being driven apart by the firing of the explosive mixture. Another point of note is in the clutch: these are of the compound or double type, the first engagement being between metal-to-metal surfaces, after which the leather cone clutch comes into action.

The Rothwell Cars.

Two chassis and an equal number of complete vehicles form the exhibit of the ECLIPSE MACHINE Co., LTD., Oldham, for whom Mr.

W. G. James is the London agent. For the coming season two sizes are being made—20-h.p. and 25-h.p.—both fitted with four-cylinder engines and live axles. The inlet valves are of the overhead type; the water circulation is by thermo-syphon, no pump being used; a current of air is drawn through the radiator by means of a fan formed on the periphery of the flywheel. The transmission is through bevel gear to a well-designed live axle. The clutch is of a special leather-faced cone type, rubber buffers engaged with apertures in the cone to allow of progressive engagement, and thus do away with any shock on starting.

SOME ACCESSORY EXHIBITS.

W. and G. Specialities.

From the Panhard Works of Messrs. W. and G. Du Clos, at Acton Vale, London, come a large selection of accessories and component parts.

Fig. 61.—The W. and G. Plug.

Included in the display is the W. and G. plug, the electrode of which is made of one solid piece of pure nickel—an important advantage so far as the durability of the plug as well as its efficiency is concerned. There is only one firing point, which invariably produces a blue-white spark of great intensity, firing the weakest charge with certainty. The plug has been well tested before being placed before the motoring public, and should have a good reception. At this stand, too, the W. and G. fire extinguisher, made in various capacities for motor-cabs, is another speciality deserving of inspection. Here, too, is seen the Summers wind screen, previously illustrated in the *M.C.J.*, as well as many other accessories which have proved acceptable to the experts at the head of this representative motor firm. They deal in all classes of specialities for the motor-car—lamps, accumulators, horns, lubricators, &c.—and are meeting the wishes of many motorists for engine and gear oils, these latter being known as the Panhard. The coach-building department also finds representation at one of the most comprehensive of the accessory stands in the Show.

Fig. 62.—Section of the W. and G. Plug.

Riches' Accessories.

One of the most comprehensive collections of accessories ranged in the gallery is that of Messrs. S. T. RICHES AND CO., LTD., the motor accessory dealers and factors, of 19, Store Street, London, W.C. Several of the specialities shown have been so recently described in our columns that they need not be referred to again on the present occasion, but we may mention that the firm keep a full range of genuine De Dion parts for all types. A special display is made of the Dietz lamps, which are shown in the side lamp, headlight, and tail lamp patterns, a particularly striking lamp being that known as the "Dainty" side light, which gives a good light of thirteen candle power, is finished in polished brass, with a ruby light at the back, and has all the parts detachable for cleaning. In connection with these lamps mention may also be made of the handy generators of the Dietz variety, which are worked on the dry principle and well controlled through the indicator and scale on the top of the device. A safety valve is provided, and there is also a two-way tap allowing for two lamps being run off the one generator. At this stand, too, is the Maxfield auto tyre inflater, the Clair silencer, the Froad brake linings, and a full range of Orno specialities, including foot bellows for use with horns or sirens, the special electric lamp-holder and reflector, and the foot glove. Another recent agency taken up by Messrs. Riches and Co. is the lubrimeter, for indicating the maximum and the minimum levels of the oil in the crank chambers. The exhibits also comprise a selection of the miscellaneous requirements, proving the capacity of the well-known Store Street firm to fulfil the demands of motorists in the most minute particular.

Wheels, &c.

The comprehensive selection of artillery motor wheels, axles, springs, &c., shown by Messrs. SMITH, PARFREY AND COMPANY, LTD., is a tribute to the facilities possessed by them for sound construction as well as proper design. At their works in Rannoch Street, Fulham Palace Road, Hammersmith, W., they have an electric welding plant of large capacity, and are able to undertake work of great variety. They will weld new gear wheels on to a solid shaft without disturbing the others; new parts to broken crank shafts; ends to broken steer-

ing arms, and, in fact, any material that is weldable. It will also be of interest to know that Messrs. Smith, Parfrey and Co., Ltd., have a process—a new system of brazing—by which they are able to repair cracked cylinders, combustion heads, water jackets and castings, &c. In addition to drawing attention to work of that description, the firm also make a display of gears and other machine work, forgings of various descriptions, mudguards in steel and bent wood, bent timber, &c.

Prowodnik Motor Tyres.

"Prowodnik" is a name that has become more familiar of late in this country, and its association with motor tyres has given it a good degree of popularity. In the gallery the PROWODNIK TYRE AND RUBBER COMPANY, of 63, Regent Street, London, W., have a large representation of their motor tyres—the red rubber instantly attracting attention. These tyres, judging from many testimonials given by experienced motorists, are of a high grade, with standard rims of the beaded edge type. They are made with both round and square treads, as well as with non-skid treads fitted with the familiar metal studs. Many exceptionally long mileages stand to the credit of the Prowodnik tyres.

Brooks's Coils and Luggage Carriers.

For the first time at a motor show, Messrs. J. B. BROOKS AND CO., LTD., of 61, Charles Street, Birmingham, who have also a depot at 11, Grape Street, Shaftesbury Avenue, London, W.C., exhibit other than their luggage-carrying specialities. We refer to the patent synchronised single trembler coil illustrated in Fig. 63. The first impression is one of compactness; the second the accessibility of all the parts. These have been reduced to occupy the smallest possible space, while the electro magnet being located in the trembler base, and the condenser being placed at the back of the coil units, enable the case to be somewhat shortened as compared with the ordinary pattern. With regard to the details, the trembler has been constructed to give efficiency at high speeds with a minimum consumption of current. The parts are instantly removable. The method of winding provides a distinctly reliable system of insulation, and altogether the new coil should prove a great advance. While the coil provides the novelty, the firm's luggage-carriers have the prominence in the display. These are well known, the general idea being to secure a maximum of area for luggage,

Fig. 63.—The Brooks Coil.

&c., in the least possible space. Thus an improvement on the ordinary circular form of tyre carrier for the roof of a car is exhibited, this being a rectangular-shaped box, the corner spaces being available for minor articles—thus securing a compact means of stowing away a goodly quantity of luggage, &c. Messrs. Brooks and Co. are able to estimate for a complete motor touring equipment, or to supply the simplest and smallest form of "Necessaire" for lady motorists. Grid trunks, as well as those for the roofs of limousines, are a speciality. Mention may also be made of the firm's combination foot-rest, tool-box, and spare petrol tin case—as neat a combination as has yet been produced by any English maker of touring accessories for motor-cars.

The "K.T." Tyre.

Naturally any new form of tyre is likely to arrest the attention of the motorist who recognises the difficulties of the present position. And when it possesses features the excellence of which is so readily demonstrable as is the case of the "K.T." tyre, special notice should be taken of its distinctive points. Proof against the ordinary ills that tyres are heir to, this excellent device is said to be as resilient as an ordinary pneumatic tyre, to render the driver immune to breakdowns, and generally to make pleasant and economical the path of the motorist. Fig. 64 gives the distinctive feature of the tyre, which consists of a series of pneumatic rubber studs joined in twos on the dumbbell principle, which project from a long flat strip of rubber. This is inserted in a circular rim, which is perforated to receive the studs. These "knobs" are the only portion of the rubber which appears beyond the rim. Beneath the studs are air spaces the bases of which are closed by means of steel discs or washers. This done, the steel rim in the rubber is forced over the flat binding rim of the wheel under compression. A few bolts are passed through the felloes and the binding rim then screwed into some of the washers—which are tapped to take the screw-ends of the bolts—so that an effective attachment is made without the bolts ever coming into contact with either the rubber or the steel rim. The construction of the tyre having thus been described, the advantages may

Fig 64.—The "K.T." Tyre.

be set forth. Every part of the rubber when attached remains in an elastic condition, the limit of which is never exceeded. The rubber, being well contracted when in contact with the ground, is rarely cut—a quality of importance. Creeping is prevented, and shock, when the tyre comes in contact with hard substances, is lessened owing to its dissipation throughout the whole circumference of the floating steel rim and the rubber underneath. The design is well calculated to avoid side slipping and its attendant dangers, and the fact that it does not throw mud in a lateral direction is a feature of considerable favour, especially with motorists who frequent narrow streets such as those at Mansfield, where complaints of the mud-bespattering of pedestrians by motorists are of frequent occurrence. The "K.T." tyre—introduced by the K.T. SYNDICATE, LTD., 52, Queen Victoria Street, London, E.C.—is also claimed to disturb the dust on the roads to but a slight degree, and not to lessen the speed of vehicles to which it is fitted. Having observed its features on the stand at the Show, we shall await the results of a road test with favourable anticipations.

The "Bleriot" Headlights.

Recent discussion with regard to dazzling headlights and their effects on users of the roads serves to give renewed interest to the display made by Messrs. BLERIOT, LTD., of 53 and 54, Long Acre, London, W.C. This includes their "Noglare" headlights and also a good selection of side and tail lamps for both open and closed cars. The new "Scout" horns are also shown. With regard to the "Noglare" lights, we may mention that they are used by the Queen on her car, and that they are becoming fashionable as well as of utilitarian import. The appearance of the lamp is of attractive form; and it is automatic in action, shutting off the glare from the eyes of anyone approaching the car from the front. The fact that it does not require the addition of levers or other devices to be operated by the driver is a great point in its favour. The special merit of the "Noglare" light consists in the construction of the glass shade. Very thin plates of glass are used in the construction of this. They are dull black on the top, thus absorbing all the light that, in the ordinary course, would rise; while being polished underneath the effect of the projection on the ground—where greatly wanted—is more powerful

than usual. To the person 200 yards away and level with the centre of the lamp there is no interference with the projection of the light by this plan; but as the lamp is approached there is a gradual diminution—not the sudden change that constitutes the great drawback of most other lamps.

The "H.P." Carburettor.

Several interesting exhibits find a place on the stand of the UNIVERSAL MOTOR IMPORTS, LTD., 10, Wilmington Square, N.W. Among these is the "H.P." carburettor, the production of the Moseley Motor Works, Ltd., of Birmingham. In this is a multiplicity of petrol jets and choke tubes, which, together with a special throttle device, secure an efficient, flexible and easily-controlled device. Both the quantity and quality of the gas supplied to the engine is exactly suited to the road conditions, as it is governed by the single throttle lever, which is opened or closed, according to the conditions of the power needed to maintain the speed of the car. In the front of the carburettor is a single control lever, which gives complete control over all petrol and air admitted through the multiple jets and choke tubes to the carburettor. At the same time it controls the engine so perfectly that by a graduated movement the car can be driven at its utmost speed or down to a walking pace on top gear, with perfectly even running. A further movement of this lever completely shuts off the gas, causing the engine to act as a brake, thereby reducing the wear and tear on mechanical brakes, tyres, &c. A still further movement of this same lever brings into operation the pure air valve which admits only pure air to the engine for scavenging purposes when coasting down hills, etc. Many useful accessories also find a place on the stand of this agency.

The Palmer Tyre.

At the stand of the PALMER TYRES, LTD., of 119, 121, and 123, Shaftesbury Avenue, London, W.C., the Palmer cording machine, which has, however, been improved since last exhibited, is an attractive feature. Of the tyres the 7-in. Palmer cord tyre has aroused much interest, while attention to the deflation alarms and pressure testers has also been general. The merits of the Palmer tyre are so generally known, that it will now suffice to refer to the efforts made by the makers to educate the motoring public with regard to the important subject of the inflation of tyres. In this connection a gauge has been designed for the purpose of testing the pressure contained in a pneumatic tyre. This is a small instrument on a flexible tube, which is screwed on to the valve. On the tube being bent the deflating pin of the valve is pushed inwards, and the dial can be easily read. A special point is made by Palmer Tyres, Ltd., of their security bolts, which have a moulded rubber covering, the edges of which are sufficiently thin and flexible to allow of them accommodating themselves to the contour of the cover and the rim. The shape is always retained, so that there is no danger of the tube blowing down between the bolt and the rim.

The "Bonhiver" Detachable Rim.

A new detachable rim, possessing distinctive merits, is that known as the "Bonhiver," and shown in the gallery by Messrs. A. GAAL AND Co., of 17, Hanover Square, London, W. This comprises a steel band solid with the wheel, in which are cut a number of helicoidal grooves. It is also furnished with a safety cam and a patented expanding driving member, producing an annular and progressing locking effect on the entire surface of the detachable rim. The other feature of the device is an ordinary movable rim furnished with steel studs, and on which is mounted a tyre with a long or short valve and security bolts with short screws. The mounting and dismounting of the rim is extremely simple, this being done by the simple operation of the sliding of the studs in or out of the helicoidal groove. The safety cam being turned round so as to unlock the rim and the driving member contracted, a slight pull is sufficient to pull it off.

White and Poppe Specialities.

A range of their two, three, and four cylinder engines, a new type of contact-breaker, a coil-testing machine, and their new silencer constitute the main features of the display of Messrs. WHITE AND POPPE, LTD., of Lockhurst Lane, Coventry. The W. and P. carburettor may also be mentioned. The engines shown vary in bore and stroke from the 80 by 90 mm. to 120 by 130 mm., the chief features being the clean and effective design, accessibility and interchangeability of parts and simple system of lubrication. The new four-cylinder 85 by 110 mm. engine is remarkably compact, with positively driven fan, oil pump, thermo-siphon water circulation, two ignitions, and self-contained starting clutch. In the contact-breaker, which is to be seen fitted to the

engines, the use of fibre in places where it is possible for it to wear has been entirely obviated. Contact is made by a hardened steel blade on hardened steel rollers—the whole running in oil. The feature of this contact-breaker is the ease with which the only part subject to wear—the blade—can be replaced. By the aid of the coil-testing machine, the exact position at which each unit of a coil fires can be accurately determined, and the trembler blades adjusted so that the spark from each unit will occur at the same relative point of the piston stroke. Messrs. White and Poppe have brought out a silencer which will effectively silence the exhaust without creating back pressure. The exhaust gases before leaving are baffled by a light plate which is held against a flange by a spring. The slightest compression of the spring permits the gases to pass out, and we are informed that at a distance of a few inches no sound can be heard.

Motor Jacks, &c.

Messrs. LAKE AND ELLIOTT, of the Albion Works, Baintree, are exhibiting a complete range of their Millennium motor-jacks, including the new garage model for workshop and washing use, and the new Millennium motor-skates for turning cars in small spaces. A fine set of samples of their wrought iron castings is also on view, with a show of tool kits, tyre levers, brazing lamps, the new valve-seat tools (which will true and re-face any valve seating, and, if necessary, re-bore for a larger valve), and some of the new sets of motor-key spanners.

Front Brakes.

The Allen-Liversidge Front Brake system, which we fully described and illustrated in our issue of the 7th inst., is being demonstrated on a car chassis by the ALLEN-LIVERSIDGE FRONT WHEEL BRAKE COMPANY, of 106, Victoria Street, Westminster, S.W. This system is destined to obviate side slip, and by greatly reducing the wear and tear on the driving mechanism of automobiles, obviates all shock during the application of the brakes. More efficient brake power is also assured, and the system is proving of great interest to the experts at the show.

Sternoline Specialities.

New introductions by the STERN SONNEBORN OIL COMPANY, LTD., of the Royal London House, Finsbury Square, London, E.C., include Sorewol, a liquid soap replacing the use of softsoap in engineering establishments for screw-cutting, drilling, turning, tapping, &c. The company is also placing upon the market a new preparation known as Universoline for use in the joints of motor-cars, &c. In addition, all their standard goods are shown in well-selected samples, these including the Sternoline chain sticks, Motosternol for water-cooled cylinders, Autosternol for air-cooled cylinders, Sternoline motor lubricant, and Cookoricid, the latter being particularly recommended for use in gear boxes and for bearings.

"New Era" Fire Extinguisher.

The value of the "New Era" petrol fire extinguisher has been so recently proved in connection with an outbreak of fire in Long Acre, W.C., that special interest may be said to attach to the stand of the VALOR COMPANY, LTD., of the Valor Works, Aston Cross, Birmingham, on the present occasion. Here are shown the "New Era" fire extinguishers, both for carrying on automobiles and for use in garages, as well as waste oil filters, spirit and oil storage cabinets, and similar specialities of the firm.

Calmon Tyres.

The CALMON ASBESTOS AND RUBBER WORKS, LTD., of 1, 2, and 3, Trinity Place, Tower Hill, London, E.C., are present with their Calmon motor tyres, in which the firm have such confidence that they are guaranteeing their plain tyres for 3,000 miles and those of the studded variety for two-thirds of that distance. In addition to the plain motor tyre is one with a square ribbed tread, much favoured by motorists, while the good quality of this and also of the steel-studded pattern are notable.

Vacuum Mobiloils.

Among the phrases that have gained significant popularity among motorists is "the oil that lubricates most." This is associated, as every practical driver knows, with the Vacuum Mobiloils, now stocked by 7,000 dealers in the United Kingdom, and used by the most successful competitors in contests both on the road and on the track. The VACUUM OIL COMPANY, LTD., has headquarters at Norfolk Street, Strand, London, W.C., and supplies its speciality in white enamelled cans sealed with a red label. So much for the external appearance; the oils themselves are guaranteed to be particularly suitable for the special purpose for which they are indicated. Thus the Vacuum

Mobiloils A, B, &c., are specially prepared for water-cooled engines, single cylinder water-cooled engines, and for gears respectively. The latter has a dark colour, but is absolutely free from foreign matter, and will remain interposed between the sliding surfaces of the metal in ball-bearing gears and thrusts longer than grease or oil of an inferior quality. Other grades are also made for various conditions of service, while special varieties are recommended for steam cars and for electro-mobiles.

The Jones' Speedometer.

Messrs. MARKT AND CO. (LONDON), LTD., of 6, City Road, Finsbury Square, London, E.C., have a full selection of the Jones' speedometers on view. Some of these have already been described in our columns, and in the issue of September 12th we illustrated Model 15, which is fitted with a maximum hand as well as with the season and trip mileage recorders. The Jones' speedometer was, as is well known, extremely successful in the Speedometer Trials nearly three years ago, since when it has proved in long use the merits demonstrated in the official test. In this device, the principle of centrifugal force is relied upon, the drive being taken from the front or steering wheels—a procedure which the makers recommend as securing absolute reliability. Where, however, motorists favour a drive from the cardan shaft or live axle, the instrument can be supplied with the necessary fittings. So far as the 1909 season is concerned, we may mention that Messrs. Markt and Co. have effected considerable reductions in the price of their speedometers without any changes in the method of construction or quality of materials—a fact which has evidently been appreciated by visitors to their stand during the week. This reduction is most notable in the case of the Model No. 22, which will indicate speeds up to 50 m.p.h., and is fully

Fig. 65.—The Jones Speedometer.

covered by the firm's guarantee as to accuracy, durability, rapidity of response to variations of speed, etc. A new range of models (27, 28, and 29) is also shown with the enclosed Jones' form of odometer, instead of the Veeder attachment, which is, however, retained in Models 20, 21, and 22. Attention may also be directed to the various combinations of these instruments with clocks, light attachments, and other means of adding to the convenience of those on the car. We illustrate in Fig. 65 a single speedometer with an electric-light attachment. The same idea is also incorporated in a "Triplet" combination with speedometer, an eight-day clock, and annunciator, the electric light being conveniently placed to illuminate the whole combination. In addition to the speedometers for cars, the firm are also showing similar instruments for motor-cycles, as well as a full selection of motor accessories for which they are agents. These include the "Teste" horns, the Marion baby auto torch, jacks, pumps, portable vulcanisers, and many indispensable tools for the motorist.

Lamps.

The COVENTRY MOTOR FITTINGS COMPANY, whose motor fittings have already been referred to, have a display of lamps of good design and construction. Their projector headlight is of a pattern that gives a steady and powerful light. It has a separate generator, and, being of light weight, is suitable for either large or small cars. They have also a self-contained headlight, which is constructed with an automatically-regulated water supply. The supply of gas is equally well under control. A good feature of the lamp is the condensing lens, which has the effect of collecting the light and throwing it in a perfect beam in the path of the car, thus being free from the vexation associated with so many glaring lights used by motorists.

The "Grose" Fixed Leather Treads.

Since the early days of motoring the Grose puncture-proof bands have been familiar to motorists, and have served to give fame to Messrs. GROSE, LTD., of Northampton. At the present show they are shown with a fixed leather tread, the economy of which is a decided advantage. The tread is made of chrome leather formed into the exact curve of the tyre for which it is intended, so that a thoroughly neat appearance is obtained. To the tread is attached a studded portion, which can be taken off and replaced when worn. The leather "body" is thus retained—a saving which represents about half the cost of the tread. None of the rivets on the tread come into contact with the rubber cover, and the device is a very effective preventive of skidding. Those who are not enamoured of the fixed vulcanised leather tread will be interested in the "Grose" detachable tyre protector with renewable studs. This is applicable to worn covers as well as to new ones, and will also be found an admirable substitute for rubber re-treading. An important point is that the clips by which the tread is affixed are nickled to prevent rust. Either of these devices will effectually and economically serve the purpose of the practical motorist.

The Simplex Speed-meter.

To some of the exhibits of the UNITED MOTOR INDUSTRIES, LTD., we shall revert on an early occasion. So varied is the collection that the space now available can scarcely do justice to such an interesting display. On the present occasion we illustrate the Simplex Speed-meter, shown in Fig. 66, which is a combination of speedometer, mileage recorder, and watch, the watch dial being an innovation on the same face as the speed-meter, and securing an economy of space

Fig. 66.—The Simplex Speed-meter.

that should be appreciated. A new radiator now exhibited is that known as the "L. and F. Sewn Radiator," the particular feature being the threading or sewing of the corrugated metal sheets so as to form a strong and durable combination without the use of solder—save at the ends, where it is necessary to give the device a familiar appearance and also serve its purpose. The Eisemann magneto of the new self-contained model is shown, all the range of Castle specialties, some effective wind screens, and a new carburettor known as the A.E.C., but fuller notice of many of these will be made on a later occasion.

Sirdar Tyres.

The SIRDAR RUBBER COMPANY has an attractively-arranged stand, whereon their specialties are shown. The company, whose London headquarters are at 21, Crawford Street, Baker Street, W., and whose works are at the Greenland Mills, Bradford-on-Avon, is well associated with the Sirdar non-nipping tubes. For these it is said that when the cover is fitted and the tube inflated, it is compressed both laterally and longitudinally. Then, when punctured, the tube closes up instead of stretching the hole open so that the air escapes. The time taken in fitting a pneumatic tyre with this patent non-nipping tube is considerably less than with the ordinary tube. In addition to this speciality the "Royal Sirdar" grooved solid motor tyres are shown, and attention drawn to the repairs of tyres undertaken by the firm. The Sirdar Rubber Co., Ltd., are able to undertake any class of repair work.

Stepney "Road Grip" Tyre.

At the stand of the STEPNEY SPARE MOTOR WHEEL, LTD., of Llanelly, are the many specialties associated with this device, which has established an universal reputation, having enabled many motorists to get home after trouble, where such would have been impossible, without delay. The exhibit which has most novelty at this stand, however, is the Stepney "Road Grip" Tyre, now shown for the first time. This is

a serious endeavour to offer a solution to the problem of skidding, and the performance of the new tyre on the road will be regarded with considerable interest. There is no tread vulcanised on the tyre, but the special feature is moulded in one piece with the tyre itself, the rubber projections of oval shape being transversely located. As these come in contact with the ground they would seem to secure an effective grip, while mud and foreign matter are allowed free exit from the groove that is formed between each two sections. The notion is an improvement on many of the ideas which have been realised in such devices, and the fact that the inventors were also identified with the "spare wheel" will give confidence to many motorists to adopt their new tyre.

"Coventry" Chains.

A representative exhibit of motor chains is made by the COVENTRY CHAIN CO. (1907), LTD., of Spon End, Coventry, whose specialties are also to be seen on some of the cars staged elsewhere. The display in the gallery consists of a full range from a miniature multiple speed actuating chain to a 2½-in. pitch roller chain, the breaking strain of which is 63,000 lbs. A chain lubricant bath, chain wheels, &c., are also included in the exhibit.

Notable Tyres.

Messrs. J. LIVERSIDGE AND SON, LTD., of 196, Old Kent Road, London, S.E., and 561, Old Kent Road, London, S.E., have four distinctly good features on their stand in the gallery, including the "Scott" non-skid treads, the "De Nevers" solid tyres, the "Vinet" detachable rims, and the "Sealomatic" non-puncturable inner tubes. The Scott non-skid treads are claimed to possess all the advantages of steel or rubber studded treads with none of their vices. The essential feature of the construction is the alternation of steel and rubber studs fixed upon a puncture-proof band. Into this band the rubber studs are moulded and the steel studs riveted; it is then vulcanised on to the cover to form the tread. As the rubber studs are slightly higher than the metal ones, they are the first to take the weight of the car, thus securing a resiliency not always present in such accessories. Experience has proved the durability of this system of construction, and the grip obtained of the road when starting the car is most marked. Messrs. Liversidge and Co. are also selling agents for the Sealomatic inner tubes, familiar to readers of the *Motor-Car Journal*. The distinction between Sealomatic inner tubes and those of the ordinary variety are two—one being a lining of a patented material and the other a second lining, also the result of a process, as to which the makers are naturally reticent. Demonstrations as to the non-puncturing qualities of the Sealomatic tubes are being made daily at the Show, and motorists are being educated as to the merits of the plan. The De Nevers grooved solid tyres are also on this stand. In this transverse grooves are cut from the surface of the tyre at certain intervals, so that the rubber can extend freely when under pressure. Owing to the segments twisting under the skidding action and allowing another segment to come into play any skidding tendency is checked. These features have given the De Nevers tyre such favour as, in addition to giving the comfort of pneumatics, side slip is prevented, any creeping action is avoided, and punctures are impossible.

The Kempshall Tyre.

Much has been heard of late of the new Kempshall ribbed non-skid tyre, and much, we venture to predict, will be seen of this excellent device upon the road in the near future. To secure a firm grip of the road and prevent the skidding associated with motoring in wet and greasy weather many devices have been tried, but only a few have succeeded to any real degree. For the 1909 season some real advance has been made upon the already well-known Kempshall tyre, notably in the way the walls are strengthened by extending the buttresses from the turrets of the tread to practically the edge of the bead. Thus a very effective strengthening is given to the tyre, rendering a burst almost impossible. Further, it is claimed that this manner of construction secures a continual cool current of air being forced on to the walls of the tyre with a cooling effect on the heat naturally generated by the friction of the road. It is one of the advantages of the Kempshall motor tyre that it can be successfully retreaded with the patent tread of the KEMPSTALL TYRE COMPANY OF EUROPE, LTD., whose headquarters are at 1, Trafalgar Buildings, Northumberland Avenue, London, W.C.

Terminals.

Although not directly represented, Messrs. F. S. NICKELLS, of Blackheath, take advantage of the occasion to keep their patent terminals and other specialties well before motorists by their exhibition on three or four stands in the Gallery.

Messrs. Alfred Dunhill, Ltd.

At the stand of Messrs. ALFRED DUNHILL, LTD., of Euston Road, London, N.W., a most comprehensive display of motor accessories and raiment is made, a visit to which will acquaint the motorist with the latest devices for convenience on the car. In horns we notice a new type, with the mouth in the shape of a serpent's head, so that it is a Mascot as well as a means of clearing the road. In the touring section many light boxes of compressed fibre, covered with waterproof cloth to harmonise with the colour scheme of the car, specially shaped to fit into any odd corners, are on view, and the "Everright" combined speed indicator, odometer, and trip recorder is also exhibited, as well as the Dunhill Annunciators, the "Saner" non-skid, the "Micro" map, the "Carbarton" garage stove, and many sundry devices that are in good demand. The section devoted to clothing is most complete, good models shown being the "Hillingdon coat," the "Rivermore," and the "Kingstown." The second named will be found suitable for either walking or motoring, and is eminently useful for those who only attire themselves occasionally for touring with motoring friends. A special section is devoted to ladies' wear, the "Castledown" coat being a garment which has a particularly stylish appearance. The firm of Dunhill are still to the front in most branches of the accessory business, and their present display gives proof of the exhaustive nature of their stocks.

Price's Oils.

Messrs. PRICE'S PATENT CANDLE COMPANY, LTD., of the Belmont Works, Battersea, London, S.W., whose motor oils have become standard preparations among motorists, have a full representation with their specialities. These include Motorine, Oleogine, Belmoline, Cruozene, and other oils and greases, while special attention is being drawn on the present occasion to "Curroleum," which has been prepared to preserve as well as to lubricate the leather of leather-faced clutches.

Ilo.

The well-known "Ilo" oils and greases placed before motorists by Messrs. EASTON AND MELVILLE, LTD., of 85, Shaftesbury Avenue, London, W.C., are being shown on the gallery stand of the British Motobloc Syndicate, Ltd., who are agents for these high-class goods. At this stand also is shown the McCord mechanical force feed lubricator for cars described in the *Motor-Car Journal* at the time of its introduction nearly a year ago.

Clothing.

As usual, Messrs. SAMUEL BROS., LTD., whose excellent styles of motor clothing have been previously illustrated in our columns, have a useful exhibit, in which their "Omne Tempus" rubberless rainproof cloth has a conspicuous place. The firm, whose showrooms are at 65-67, Ludgate Hill, London, E.C., were among the first of the leading tailors to recognise the needs of motorists in connection with their raiment; they were also pioneers in the recognition of the fact that such garments should be of such a character as could be worn, on occasion, when off the car. How well this idea has been carried out is apparent from the motor coats for both ladies and gentlemen which are to be seen on their stand. The "Omne Tempus" cloth is being subjected to the continual dripping of water to give ocular proof of its rain-resisting qualities, and it is also exhibited as made up into garments of fashionable style. A speciality is made of the "En-tout-cas" coat, which is a useful combination of rain coat, motor coat, and ordinary walking coat in one garment. Liveries for chauffeurs is another important section of the activities of Messrs. Samuel Bros., Ltd., who have also a department for automobile accessories. In this are stocked several good types of lamps, horns, goggles, and other requirements for the modern motorist.

"Shell" Spirit.

Many events in which the winners have used the "Shell" spirit have caused the BRITISH PETROLEUM COMPANY, LTD., 22, Fenchurch Street, London, E.C., to be widely known. It has certainly been adopted by leading motorists, and has enabled them to win distinction, as well as prove of real automobile service.

Components and Accessories.

Messrs. GAUTHIER AND CO. have a large display of components and accessories, many of which are so well and favourably known that extended notice is really unnecessary. These include the "Malicet and Blin" back axles, steering gears, &c., the Muirhead "high-tension" magneto, "Ossant" silencers, radiators, &c. The T. and M. multiple jet carburettors, synchronisers, and lubricators are also on this stand.

The new "sight feed under pressure" lubricator adopts the principle of interposing between the oil supply under pressure and the bearings which are to be lubricated a glass vessel filled with water or other suitable liquid. The oil enters the lower end of the vessel through a nozzle, rises drop by drop through the liquid by reason of its inferior specific gravity, and passes out at the top to the bearing, the liquid remaining in the vessel. In the T. and M. carburettor the essential features are the absolute and positive control by means of one lever only, the rapid acceleration, the perfect mixture, and the low fuel consumption.

The Claudel-Hobson Carburettor.

Among the new carburettors which are exciting considerable interest is the Claudel-Hobson device, introduced by Messrs. H. M. HOBSON, LTD., of 29, Vauxhall Bridge Road, London, W.C. This is claimed to give an economy of fuel up to 25 per cent. on a full load, and differs from other carburettors in the heating of the petrol before it leaves the jet. It has a spraying jet fitted with air injector, and the revolving throttle is combined with an air regulator of a special shape. The whole device, containing the float chamber, mixing chamber, petrol channels, and hot-water or hot-air channels, is of one casting. Petrol enters the float chamber by passing through a fine sieve or filter, its admission being checked by a float of the usual type, which is easily accessible for cleaning purposes. Petrol leaves the float chamber, passing through a rather wide channel, heated by hot water, proceeds through the patent jacketed jet in the usual way into the mixing chamber, and so on to the engine. The construction of the jet, and the way in which the throttle and control are cut and combined with the air regulator are interesting. The jet is covered by a tube drilled at the bottom with holes, and also at the top at the same level as the jet.

Fig. 67.—The Claudel-Hobson Carburettor.

When the throttle is shut, the upper part of the jet is in the mixing chamber, and the petrol is sucked through the top holes of the tube, whilst the suction is relieved by a proportionate quantity of air entering through the holes of the bottom of the jacketing tube, which is in direct communication with the atmosphere outside the regulator, thus ensuring a perfect spray and an accurate proportion of petrol passing into the mixing chamber, whilst the throttle and air regulator combined are so cut that, when opened—to whatever extent—for the engine to pick up, accurate proportions of air and petrol pass into the cylinders.

Messrs. BENTON AND STONE, of Birmingham, have a good showing of motor tyre-pumps, lubricators, pressure-pumps, &c. Their petrol filters have been adopted by most of the London cab companies. The "Heron" patent power pump for garage use, which has already been described in our columns, is also on view.

Messrs. HATTERSLEY AND DAVIDSON, of Norfolk Street, Sheffield, have a varied display of their motor accessories and tools, one of the most ingenious of the latter being the Schroeder ratchet spanner.

The exhaustive article we published on the 31st on the G.L. carburettor had undoubtedly prepared many visitors for their inspection of this notable device to save petrol by securing perfect carburation. It is shown on the stand of the MOTOR SUPPLY COMPANY, to whose specialities we shall be making further reference in an early issue.

On several of the stands in the Gallery the Ara vulcanising process is to be found—a simple means of assisting the motorist when in trouble on the road.

(To be continued.)

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE PARLIAMENTARY AGITATION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I did not know there was any "agitation in the House of Commons against motorists." There are a great many members, of whom I am one, who are afraid if our privileges are abused, and if some check is not put upon the reckless driving of many thoughtless owners-chauffeurs, we shall get public feeling against us to such an extent that restrictive legislation will have to be introduced. From my experience, and I have motored many thousand miles, the objection to motorists is the greatest in small market towns with narrow streets, and in villages with small gardens, and in many cases without causeways, so that the road is used by those who walk and by the children. If the rights of such people were properly considered, and their little gardens were not continually covered with dust (has not every motorist noticed the road carefully watered in front of some pretty cottage garden?) I think we should hear very little about the speed limit upon the broad highroad. It was with the idea of recognizing the rights of those who have to live by the roadside and to protect motorists from unreasonable legislation that

An Innovation in Ballooning.

Mr. Carl G. Fisher, of Indianapolis, U.S.A., tired of having his balloon hauled about in a farm wagon and he and his guests subjected to the discomforts of walking after an ascent, recently decided to do away with the ordinary basket and attach to the balloon a 25-h.p. Stoddard-Dayton car. The idea was put into practice recently and naturally attracted considerable attention. Every detail of the ascent was successfully carried out, and a landing was made about 100 miles from the starting point just before dusk; the balloon settled slowly to the earth, the car alighting on the ground so gently that the passengers did not rise from their seats until after all four wheels were on terra firma. It took but a few minutes to deflate the balloon, roll it up and start the car. Mr. Fisher is much elated over this novel experiment, and states that all his balloon trips in the future will be made with a hanging motor-car rather than a basket, it being so much more convenient to load up and go home than to hunt round the country for some one to take care of the balloon.

I seconded the resolution of which I send you a copy. I believe it is wisest to advocate just administration rather than repressive legislation.—Yours truly,

W. E. B. PRIESTLEY.

THE KNIGHT ENGINE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your recent description of the "Silent Knight" engine and to all articles which have appeared in the various journals touching the same, I would like to make a few remarks as one who knows a little about internal combustion engines, and who has run into the "sleeve" form of valve long before the advent of the "Silent Knight." Of course it is quite wrong to call this engine valveless, as it possesses just as many valves as any ordinary four-stroke engine, only, instead of being of the poppet type they are of the "slide" type. Now this type of valve is almost the oldest in existence, and was used by all the early builders of gas engines, except that they employed a small flat valve, or valves, while Mr. Knight uses sleeves completely enveloping the cylinder, though he only uses a very small fraction of the valve for the purpose of controlling the entry and exit of the mixture. Where the particular advantage is of employing 95 per cent. more valve surface than is necessary, I fail to see. As for the actuation of these valves by eccentrics instead of cams,

there is nothing new in this, as it has been done scores of times before; I myself used them more than ten years ago, and was severely criticised for so doing, though, provided the port area is sufficient, the slow opening and closing of the valve is of little consequence.

So far as the superior action claimed for this engine goes it can only be traced, if it exists, to the large port opening provided; the only reasonable claim which can be supported is that there is less cooled surface exposed to the heated gases of combustion, and in the case of high speed motors this is a very slender claim, particularly in the small sizes used on automobiles. The disadvantages of sleeves are very apparent. First there is the great expense, for they must be ground both inside and out to an exactness almost impossible of attainment. Many years ago there was an engine called the "Rotary Piston"; it was the invention of Mr. H. T. Dawson, and was built by the Dawson Gas Engine Company, of Clapham; in this motor the piston was a long sleeve within the cylinder and acted as both inlet and exhaust valve by being caused to rotate, so opening and closing plain ports in the sides of the cylinder which corresponded with ports cut in the sides of the piston sleeve. This was a far more practical and easy method, but in practice it was found almost impossible to attain sufficient accuracy. What, then, in a motor where there are three surfaces to be got to such a state of perfection? As the sleeves become worn at the ports there will be particles of carbon forced between the rubbing surfaces, and these will quickly cut the sharp edges of the valve openings away so as to prevent proper opening and closing of the valves or ports. Furthermore, what will become of the poor little countershaft when the engine is cold and the oil becomes stiff over the enormous surface of the sleeves? If we must have slides, then let us have the smallest slides we can.—Yours truly,

INCANDESCENT.

THE MOTOR-CAR OF THE FUTURE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The type of car that apparently is now in demand for Bristol and the West of England is a four-cylinder car, seating four persons, with an engine of about 18-h.p. actual.

Some of the points on which improvement is required are: more silent running engines, covering in of the mechanism of the car to keep mud and dust from it as far as possible, better clutches on the smaller cars, smooth-running vehicles for moderate speeds, and economical running cars rather than fast machines.—Yours truly,

J. S. WILLWAY AND SONS, LTD.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We find we are usually asked in this district (Cheltenham) to supply a type of car with a four-cylinder motor and four-seated side entrance body, for which, frequently, with glass screen, Cape cart hood, lamps, &c., the prospective purchaser does not wish to pay more than £350, the size of engine required being, say, 18 to 22-h.p. R.A.C. rating. A car that could be turned out as above to sell complete at £250, which would run nicely, and made by a firm with a reputation for building a reliable and lasting article, ought to command a big market right away. At the same time there is a certain demand for larger cars, which, however, steadily diminishes with an increase of price, covered bodies, usually landaulets, being nearly always required for the largest cars.

Certain two-cylinder cars are to a considerable extent able to hold their own, presumably because they are substantially cheaper than nearly all the four-cylinder cars yet made by any of the better-known firms; even when second-hand they are very saleable. Besides the above types, we believe a big future awaits a car which, even with a four-seated body, can be sold at a figure a little over £100.

Personally we feel certain it is only a matter of time before such a car will be marketed, and successfully too, its essential points being simplicity, absolute reliability, ease of control, and lowness of upkeep, high power and unnecessary finish not being, of course, expected at that price.

Generally we should say that very much importance is attached to lowness of upkeep, especially by motorists of long standing, and that the prevailing feeling seems to favour British cars, which, apart from patriotic motives, we welcome on account of the greater ease with which business can be conducted.

We should say that any improvement in design which would tend to decrease the amount of attention and expenditure necessary to keep a car running would be very much appreciated. Very many makers would do well to look more closely into details on their cars which are apt to prove for some reason or other a source of annoyance to the buyer, especially when they in any way affect the "certainty of action" of any part of the car, or "ease of control." Absolute reliability should always be the watchword of every maker, and not only should the chance of a car being temporarily or totally stranded be reduced to a minimum, but the possibility of the car developing some wear or defect which will often unexpectedly necessitate a visit to the repair shop, perhaps just

when the car is most urgently required, should be so remote as to be almost entirely absent.

All parts of the car should be so designed and arranged that, in the event of any repairs or renewals proving necessary, any part can be easily taken down without disturbing other parts more than is absolutely essential, and those parts which from past experience have been proved to be the most likely to require attention should be so arranged as to be specially accessible.

We think it would be a great advantage if every maker were to imitate the practice adopted by some firms of turning cars out really ready for the road as regards the various accessories which are bound to be required, the price of the finished car to include the extra cost of these. It is a common source of disappointment to a beginner to find that, after having placed his order, he has to face an extra outlay for lamps, tools, horn, pump, jack, &c.—Yours truly,

H. E. STEEL, LTD.

RACING AND THE PUBLIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The "Four-Inch" Race is supposed by some to give results that will establish the correct relation between bore and stroke. This is of course incorrect; limit this bore and more power will be obtained by increasing the stroke to an otherwise undesirable degree; limit the stroke and more power will be obtained by increasing the bore to an otherwise undesirable degree; either restriction produces freaks of a nature that are not useful to design as the results that racing may produce. There are many formulae of varying degrees of refinement that take into account both bore and stroke. Races under any of these will produce more useful results. The matter is well enough understood to furnish a formula that will make victory possible to a motor differing little if at all from the ideal engine for a motor-car.

There is another restriction the bearings of which on the development of the motor-car deserve very careful consideration. I mean the minimum weight. At first sight this appears a wise restriction, since it moves from the designer the temptation to increase speed and rapidity of getting up speed by ruthless cutting away of the vital parts of the car and its consequent safety. That it is possible to reduce weight by sacrificing reliability to the point of danger is indisputable, and for this reason the entry of any car should be subject to the veto of the ruling body, who would exclude any vehicle that in essentials was insufficiently strong. The ruling body should be technically sound enough for its decisions to be made without fear, and accepted without cavil; and such being the case the minimum weight limit should cease. Enormous reductions in weight would inevitably result, and in some few cases weak designs would be allowed to compete and disaster might result (though motor accidents appear remarkably harmless), but the ideal car would be brought much nearer realisation.

By the ideal car I mean the one that will with economy travel at a better average speed without at any point exceeding a certain limit (legal or otherwise). A light car means less reduction of speed uphill. It means a quicker increase of speed after a stoppage, and since the limit of speed depends on area rather than weight, the light car will not be able to reach an appreciably higher speed than a heavy one. Let us hope that these points (all of them points that directly or indirectly benefit the public apart from the motorist) will be borne in mind by the R. A. C., the body that rules our sport.—Yours truly,

JOHN PUGH.

CLEANING OUT ENGINES WITH PARAFFIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you tell me the best and most thorough way to wash out the crank chamber of a motor with paraffin when replacing the old lubricating oil with new, without taking anything to pieces? It seems to me that merely turning the motor by hand would not splash the paraffin about sufficiently. Do you think harm would result if the motor were run a few times for five or ten seconds each time, at intervals of a few minutes, with paraffin only in the crank chamber? I refer to damage to wearing parts or risk of fire or explosion.

The alternatives which suggest themselves to me of putting the paraffin in at the top of a hill and letting the car drive the motor down it, or, failing a hill, of getting a tow by another car; both methods seem rather far-fetched and troublesome.—Yours truly,

THERMO.

[There is really no necessity to take so much trouble as "Thermo" thinks may be advisable when changing lubricating oil in a crank chamber. If the old oil be drained off and enough time allowed for the operation, there will only remain quite a small amount of matter requiring washing out, and this will be found at the bottom. Most of the particles are metal worn off the bearings and cylinders, &c., together with a certain amount of carbon from the oil, and, except when the motor is running, this will gravitate close to the drain cocks, whence it can easily be swilled by means of squirting some paraffin with a syringe in by the vent or oil filler that is usually to be found in the upper portion of a crank chamber. To run the motor with a paraffin bath would cause a dreadful smoke, but, if it were only done for a few seconds, it could not damage the engine as regards the wearing parts or cause an explosion. A little paraffin squirted into the tops of the cylinders is often recommended in order to keep the piston rings from getting clogged, and if this is practised in moderation it is a good plan.]

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the driver of a 6½ h.p. two-seated Regal car with single-cylinder Astor engine, and I am troubled with loss of power when ascending hills. On the level I have no trouble whatever. I should esteem it a favour if you could kindly state the probable cause of the trouble and the remedy for the same. The fault is a new one, as the car used to work much better.—Yours truly,

RICHARD MURRAY.

[We think it probable that in reality there is a loss of power in this case whether climbing hills or going along the flat; but it is very difficult to detect, unless the loss is very pronounced, except when going up an incline. There is but little doubt but what the fault will be found to have its seat in the engine, if everything about the transmission is free and the vehicle runs easily down hill. The compression is one of the first things to be suspected from the information before us, and it is more than possible that a thorough re-grinding of the valves may put the trouble right. If the engine is an old one it may want new piston rings. Sometimes a motor will "sulk" with a change of lubricating oil or a different brand of petrol. Have either of these been changed lately, or has the car only started to lose its hill-climbing capacity since the colder weather has set in? In the latter case a little alteration to the carburettor may set things right again, say by warming the air a little.]

CLUTCH TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been troubled considerably with a slipping clutch of the plate type, and am wondering if it would be possible to fit a claw arrangement to the floating part of the clutch which would, when the clutch was fully engaged with fly-wheel, drop into slots therein and thus lock the fly-wheel and clutch and prevent any slipping. The jaw arrangement should of course be removed by the clutch withdrawing pedal before the travel of the latter commenced to lighten the tension of

One of the Motor-Cycle Carriers recently built by an Austrian firm for the Mexican Government.

the spring holding the plates up to their work. My car is a six-cylinder one. Perhaps some of your readers could advise me if such an idea is practicable, and if by any chance it is in use.—Yours truly,

W. ETHERINGTON.

[In this case it will be better for our correspondent to ameliorate, or "endure the ills he has, than fly to others that he knows not of." His idea of introducing a positive lock for the clutch has been tried before, with more or less disastrous results. It sounds feasible on paper, and even in practice it is possible to introduce a positive lock for the clutch which will work all right when perfectly adjusted, but once let it get a trifle too "previous" in its grip and away goes something, which may mean the purchase of a new crankshaft, or the best part of a new gear-box. A slipping plate clutch is not a difficult thing to remedy by less drastic measures than suggested; it is probably out of line, or the lubricant is at fault, or perhaps the springs are too weak. Anyway, unless the clutch is altogether a bad one, or not suitable for the power, it should not be an expensive or difficult matter to put right.]

MR. S. F. EDGE writes with reference to Mr. Jarrott's letter on his withdrawal from dangerous racing, "My letter to the 'Times' is dated September 22nd, and I have received a letter from the Brooklands Automobile Racing Club dated November 11th reading as follows:—

Brooklands Automobile Racing Club,
Carlton House, Regent Street, Waterloo Place, S.W.

S. F. Edge, Esq.
14, New Burlington Street, W.
November 11th, 1908.

Dear Sir,—In reply to your letter of to-day's date, I beg to say that no trace exists in our record-book of any records having been broken by you since September 18th.—Yours faithfully,

(Signed) KENNETH L. SKINNER.

This sets out clearly that I have not broken any records since September 18th. I trust that Mr. Jarrott will now withdraw his unsportsmanlike insinuations and will apologise for having made them, and I would advise him for the future to refrain from casting aspersions on business opponents until he is sure of his supposed facts."

CLUBS AND ASSOCIATIONS.

ROYAL.

THE Manchester A.C. and the Westmoreland A.C. have decided to become associated with the R.A.C. under the revised scheme.

THE AUTOMOBILE ASSOCIATION.

At the meeting of the A.A. Executive Committee, held on the 10th inst., reports and recommendations from the Committee of Public Safety were considered, and it was unanimously decided to call for the resignation of certain members of the Association.

The committee had the pleasure of welcoming the 8,000th member of the association in the person of Count Stenbock Fermor, Captain of the Chevalier Guards of H.I.M. the Czar of Russia. Prominent among other new members elected at the November meeting were the following:—The Marquis of Anglesey, the Marquis de San Guillano, the Marquis de la Granja, the Earl of Sefton, the Earl of Eglinton and Winton, the Marchioness of Exeter, Anna Countess de Hamel de Manin, Lady Wemyss, Lord Leonfield, Lord Hotham, Lady Clifford, Lady Day, Lady Mary Turner, Sir Nathaniel Dunlop, Bart., Sir Wm. F. Hartley, Sir Daniel Cooper, Sir Thomas V. S. Gooch, Lady Battersea, and Sir Wilfrid Peek, Bart.

SOCIETY OF MOTOR TRADERS.

ON Tuesday the dinner of the agents' section of the Society of Motor Manufacturers and Traders, Ltd., was held at the Restaurant Frascati, London, with Mr. W. M. Letts in the chair.

In proposing the toast of "The Motor Trade," Mr. S.F. Edge gave some interesting figures with regard to the present position of the industry. In referring to the business in cars from abroad he went on to say that the industry was employing about 180,000 workpeople in this country. These with their dependants represented a population of 420,000 people interested in the future of the automobile. The output of the British motor trade he calculated was about £8,000,000 sterling, a figure that probably would not be exceeded, for the decrease in the price of cars would tend to keep it at this figure. Touching on the road question, he pointed out that many of the great highways were not at present suitable for motoring. Motorists did not wish so much to travel at a high rate of speed as to be able to maintain regular running without the constant starting and stopping that is necessary under the present conditions. Signs and warning posts associated with the high roads and cross roads should be located at the bye-turnings for the information of motorists about to turn on to the main arteries of traffic. Mr. Charles Jarrott responded to the toast. That of "The Agents' Section" was proposed by Mr. E. Manville, who referred to the mutual dependence of agents and manufacturers on each other. Response was made by Messrs. A. R. Atkey and J. S. Stafford.

BROOKLANDS.

THOUGH the full programme for next year's racing at Brooklands has not yet been settled, it has been decided to repeat the three popular two-day meetings on the Easter, Whitsun and August Bank Holidays and the Saturdays which precede them.

BRADFORD AUTOMOBILE CLUB.

THE Bradford Automobile Club held a successful smoking concert at the Great Northern Victoria Hotel last week. Owing to the unavoidable absence of the president, Mr. Tom Mitchell, the chair was filled by Mr. Kent, who was supported by Mr. Hepper, President of the Yorkshire Automobile Club.

SOCIETY OF MECHANIC AUTOMOBILE DRIVERS.

THE Society of Mechanic Automobile Drivers of the United Kingdom, of which Sir Robert Gunter, Bart., is president, is an organisation for the mutual benefit of drivers, and has 500 members. The idea is not to deal with questions of wages and the like, but to find employment for men of efficiency and character, and also to assist them in other ways. Mr. G. T. Clarke, Rawling's Garage, Halkin Street, Belgrave Square, London, S.W., is the secretary, and will be pleased to forward information to those who communicate with him.

BRITISH MOTOR-BOAT.

DURING the last six months there has been a large increase in the number of candidates for membership of the British Motor-Boat Club. Those who intend putting up for membership now will have the advantage of the rule which gives membership from December to April 31st for one half of the ordinary subscription.

SPEAKING at the annual dinner of the Cambridgeshire Motor-Cycle Club, Mr. A. H. Moreing asked for a spirit of comradeship among motorists in order to combat prevalent prejudices.

MR. C. R. ENGELBACK has been lecturing on "Motor Cars" before the Elswick Foremen and Draftsmen's Association.

THE Motor House, 314, 316, 366, 368, Euston Road, N.W., send a special bargain list of motor-cars, which will be of material assistance to prospective motorists.

MOTORIST v. ROAD CONTRACTOR.

SHERIFF SUBSTITUTE BLAIR, of Dumbartonshire, has delivered an interesting judgment in an action for damages at the instance of Mr. W. Chrystal, of Auchindennan, a member of the S.A.C., against the contractors for the Dumbartonshire Tramways, for damage done to his motor-car by a tramway overhead wire pole, which the contractors negligently allowed to lie on the roadway in a dangerous position.

The Sheriff found that the pole, which was of iron and about 30 ft. long, and which weighed about 800 lb., had been left lying on the roadside, but projecting some little distance into the roadway at the thin end, probably from one to three feet, and that Mr. Chrystal's car, in negotiating a corner to clear a red danger lamp marking trench operations on the road, ran into the pole, burst two tyres, and did £7 worth of damage besides. On account of the failure to take proper precautions for the safety of the public and their consequent fault and negligence, the Sheriff decreed against the contractors for £39 3s. 5d., being the repairs costing £7 0s. 9d. and two new tyres, £32 2s. 5d.

With regard to the item of £55 which was included in the claim in respect of loss of use of the car during the time it was under repair, the Sheriff disallowed the same, but stated that, if Mr. Chrystal had hired another car rather than submit to the inconvenience of being without one, there is no doubt that the £55 must have been added to the amount decreed for, and that consequently the defenders had to congratulate themselves that Mr. Chrystal had not done so.

ROAD REPORTS.

MOTOR UNION SIGNS.—Danger signs issued by the Motor Union are in course of erection at Penzance, Blackheath, Birdlip Hill (Glos.), Richmond Park (Robin Hood Gate), Harrietsham, on the Maidstone-Folkestone road, and at Pounce Hill, to the east of Saffron Walden. In four of these cases the signs are being issued at the instance of the local authority. Ipswich Council has asked for signs for two schools, and has intimated that unless drivers moderate their speed a drastic speed limit will be applied for. Thirty signs were sent out by the M.U. during October, bringing the total to 70 in towns and villages, 280 near schools, and 120 near concealed turnings.

CHESHIRE.—The Highways Committee of the Cheshire County Council recently recommended the Council that the surveyor should inspect the Goyt Valley Road at Macclesfield, with a view to the application for an Order prohibiting motor traffic thereon. An amendment including several other roads in the application was supported by Mr. F. Barlow as the user of a car. It was, however, lost.

HEREFORDSHIRE.—It is said that the cost of the maintenance of the main roads in Herefordshire has increased from £16,000 to £27,000 in recent years, and the County Chamber of Agriculture has just passed a resolution calling for the licence fees of motorists being increased, the revenue being devoted to the repair of the roads.

COMPANY NEWS.

URBAN TAXICABS, LTD., has been registered with a capital of £200 in 1s. shares.

THE eleventh annual general meeting of the shareholders of Rossleigh, Ltd., will be held at Edinburgh on Tuesday next, when the directors will report the profits available for division, including the balance carried forward from last year, amount to £7,276. It is recommended to pay a dividend of 6 per cent. on the preference shares and 10 per cent. per annum on the ordinary shares and to carry forward £4,817.

THE secretary of the F.I.A.T. Motor Cab Company, Ltd., has issued a circular letter, in which it is stated that the company has seventy-seven complete cabs plying for hire, and a further ten to fifteen are being placed on the streets weekly. The average daily takings are in excess of the estimate foreshadowed in the prospectus. Apart from these cabs there are a further forty in the garage of the Thames Bank Wharf Motor Works, Ltd., and for the detention of these the company are claiming damages in a forthcoming arbitration. Negotiations have been concluded for the tenancy of garage premises adjoining King's Cross (G.N.R.) Station. The annual meeting is due to be held before the end of the year, and the directors see no reason why those interested in the company should have any apprehension as to its future prosperity.

MESSRS. DAVID BRIDGE AND CO., engineers, Castleton, Manchester, have secured an order for a complete installation of their well-known Heywood and Bridge's patent friction clutches, together with the whole of the millwrights' work for driving electric generators, compressors, &c., the power being over 3,000 h.p.

THE Sunday of the Olympia Show week is invariably a quiet one for provincial agents, and for several years past Mr. T. C. Pullinger, of Humber, Ltd., has organised a trip for those Humber agents forced to spend the week end in London. On Sunday last a number of Humber cars left Holborn Viaduct, E.C., at 9 a.m., with a large party of agents, and a delightful run was made to Brighton, lunch being partaken of at the Royal York Hotel. The journey throughout was most enjoyable, and formed a pleasant break in the round of show business.

CASES AGAINST MOTORISTS.

DISMISSALS.

At the Guildford Petty Sessions, Lieut. Rose was summoned on Saturday for exceeding the legal speed limit on the Portsmouth road on October 18th. Superintendent Jennings estimated the speed at thirty-five miles per hour. The defendant, in his evidence, said that he, with two ladies, went out to see what English traps were like. Other witnesses were called to disprove the police evidence and the case was dismissed.

At the Reigate Court on the same day Mr. E. M. Welton was similarly summoned for exceeding the speed limit at Merstham. The defendant said that he had made a wager that he would drive from London to Brighton in a certain time without at any part of the journey exceeding the speed limit. The gentleman with whom defendant made the bet said that he kept close observation upon the speedometer the whole journey and they never exceeded twenty miles an hour; whereupon the case was dismissed by the magistrates.

A QUARTETTE OF SUMMONSES.

Richard Bird, of Ley Street, Ilford, appeared at Highgate to answer four summonses for (1), driving an unregistered motor-car, (2) driving the car without having a licence, (3), driving without having a front light, and (4) for driving without having a light at the rear of the car to render the identification plate easily distinguishable after dusk. F. W. Jenkins, of the Maddox Street Motor Company, Ltd., W., had to answer two summonses for employing a person without a licence to drive a motor-car, and with aiding and abetting Bird to drive

Mr. Barker appeared for the Commissioner of Police, and ascribed the lateness of the summons to the great difficulty in tracing the defendant. The affair happened in the early morning, defendant's car, which was on the wrong side of the road, running into a one-horse van. Mr. Shipley would not give his name and address. The car was registered in the name of a Mr. Carne, of Wales, who sold it over a year ago. In fining defendant, the chairman said £20 was for reckless driving, other fines and costs brought the total to the amount already stated. The Bench also suspended defendant's licence for six months.

BATCHES.

Several cases against motorists have been heard at Lewes, Haywards Heath, Kingston (12), and Reigate (4), Brentford, Carlisle, Paisley (14), Dumfries (3), Weymouth.

Motorists have lately been summoned to the courts at Grantham, Brentford (3), Richmond (a fine of £20 and costs in one case), Cambridge (4), Woking (£15 fine in one case), Horsham (3), Croydon and Epsom (8), Chertsey (7), Kingston (16), Grantham (3), Petworth (4 cases, occupying nine hours).

RECKLESS DRIVING.

At Epsom, on Tuesday, Ian Hayward, of St. James's Place, London, S.W., was fined £10 and costs for recklessly driving a motor-car.

PUBLIC SERVICES.

THE colour of the Fiat cabs plying for hire in London has been changed to dark blue for business and practical reasons. It was found by experience that yellow was too delicate in use, and that it was very apt to become stained by the mud in wet weather.

The Lorraine-Dietrich Four-Ton Petrol Wagon which took part in the recent Trials in Austria.

This vehicle has lately been making a tour of eastern Europe, demonstrations having been given in Bulgaria, Roumania, Turkey and Greece.

(Allgemeine Automobil Zeitung.)

an unregistered car. P.C. Barton, 357Y, said that he stopped Bird at 9.15 p.m. in the Broadway, Crouch-end, for not having a lighted lamp in front of the motor-car. Witness then noticed that the rear lamp was not alight. Bird, when asked for his licence, produced one which had run out three days before. Inspector Thomas said he afterwards ascertained that the car had not been registered by the defendants, with whom it had been left for sale. On the night in question the car was out for a trial run. Mr. Jenkins was fined 10s. on each of the two summonses against him; and Bird, whose previous licence was clean, was fined 20s. and costs on each of the four summonses against him.

EXCEEDING THE LIMIT.

At Kingston, recently, Miss Dorothy Levitt was summoned for exceeding the limit at Esher on October 25th. It was stated by the police that the defendant was travelling at a speed equal to twenty-eight miles an hour, and that when stopped she denied the speed. Defendant conducted her own case, and subjected the police witnesses to a searching cross-examination. The chairman, in imposing a fine of £10 and costs, said there were five convictions against her. If she appeared before the Bench again, and was convicted, her licence would be suspended.

SUSPENSION OF LICENCE.

Fines and costs amounting to £35 14s. 4d. in all were imposed by the Croydon County magistrates, on Saturday, upon Percy Snipley, of Caenley Hall, Lincoln, who was summoned for driving a motor-car recklessly at Wallington on August 15th, for failing to give his name and address when requested, and for driving an unregistered motor-car.

THE Hull Hackney Carriage Committee has agreed to allow three motor-cabs to stand outside the railway station at Hull.

"POLICE CONTROLS."

AT Merstham the police trap has been in frequent operation of late. THE "control" in the Shooter's Hill Road, London, S.E., is in almost daily observation by the local police.

POLICE traps have been established on the Glasgow and Busby road, Paisley; the Dumbarton road at Yoker; Newlands; and the Paisley to Birth road at Howwood.

ON Saturday last the Daimler Company's stand at Olympia was a scene of great animation, and a record was established in that we are informed no less than fifteen of the new models were sold in the same number of minutes.

THERE is an excellent opportunity just now for an automobile racing enthusiast to achieve greatness. A purchaser on the Vauxhall Company's Olympia stand last Saturday, after complimenting Mr. Kidner on his Gaillon success, asked him if the company were running anything in the French Grand Prix of next year. He was told they were not, but they were so impressed with the capability for improvement of last year's British performances that they were ready to build a Grand Prix team of three Vauxhalls for anybody who would enter them and have them driven—confident, moreover of turning out a team that should stay the course.

FORTHCOMING EVENTS.

NOVEMBER.

20th-28th.—Stanley Show at the Royal Agricultural Hall, London, N.
 25th (W.).—Annual Dinner of the Founder Members of the Royal A.C.
 26th (Th.).—400-mile International Grand Prize Race of the Automobile Club of America.
 28th (Sat.).—Opening of the Paris Motor Car Exhibition.

DECEMBER.

2nd (W.).—Lecture by Mr. E. Stuart Bruce, M.A., before the Society of Arts, on "Mechanical Flight."
 3rd (Th.).—R.A.C. Lecture by Mr. H. M. Wyatt on Magnetos.
 13th (Sun.).—Closing day of the Paris Salon.
 23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

JANUARY, 1909.

14th (Th.) (provisional).—Annual Dinner of clubs associated with the R.A.C.
 22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
 26th.—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

War Office Fourteen-days' Trial for Light Tractors.

LIGHTING-UP TIMES—LONDON.

| | | | | | | |
|----------------|-----|-----------|-----|-----------|-----|-----------|
| Nov. 21st—4.59 | ... | 23rd—4.57 | ... | 25th—4.54 | ... | 27th—4.52 |
| " 22nd—4.58 | ... | 24th—4.56 | ... | 26th—4.53 | ... | 28th—4.51 |

To find the approximate lighting-up time in November for Birmingham 5 minutes should be added to the above times, 5 for Manchester, and 8 for Glasgow.

WANTED—A CHAUFFEUR.

"Wanted—a chauffeur, both sober and neat,
 And able to clean and repair,
 And when he's not driving, to wait on the door,
 And manage the pony with care.

He must sleep in the stable, and take his meals out,
 The chickens and pigs he must feed,
 And keep all the lawn and grass borders mowed,
 And the garden he also must weed.

He must work every Sunday, and clean all the boots,
 He must milk and attend to the cow,
 And put up the clotheslines, and beat out the rugs,
 And to polish the windows know how.

For duties like these the munificent sum
 Of ten dollars a week he will get"—

The woman or man who inserted this ad.
 Is in want of a chauffeur as yet.

—New York Sun.

MESSRS. J. KEELE, LTD., have received one of the first 8-h.p. two-cylinder two-seated Renault which has arrived in this country, and as they have not room for this on their stand at the Olympia Show, they have it on exhibition in the showrooms at 72, New Bond Street, London, W.

As evidence of the wearing quality of modern British-built motor-cars we have just been informed of an instance of a vehicle made by Humber, Ltd. One of their agents—Mr. Webb, of Monmouth—has offered for inspection at the Olympia Show the mechanism of a 20-h.p. Humber, of which he received delivery about three years ago. The car had been used extensively for hiring purposes ever since, and has been driven no less than 91,400 miles, yet, notwithstanding this enormous distance and the rough usage the machine has had, the engine gears, back axle, &c., show no appreciable sign of wear.

AMONG the various forms of wheel control, the horizontally-operated level is deservedly very popular with a large number of motorists, and those who have grown used to this system often find some difficulty in accustoming themselves to other methods. Recognising this, and in order to enable the well-known Bowden car controls to be available for drivers who prefer the horizontal movement to any other, the E. M. Bowden's Patents Syndicate, Ltd., have introduced a couple of new controls, which, though practically the same, have this difference, that one is designed to be fitted to cars with hollow steering pillars, while the other is specially adapted for solid pillars.

REFERRING to the reference in our issue of the 24th ult. to the 550 miles run of one of the new 33-h.p. Daimler cars, we are asked to state that the test therein referred to was not an official trial conducted under the observation of the Royal Automobile Club, and that in running it the Daimler Company acted in contravention of the Club's competition rules, for which they have expressed regret, and tendered an apology to the R.A.C.

BUSINESS NEWS.

EARLY in the spring of 1909 Mr. F. W. Lanchester will give three lectures before the Society of Arts on "Aerial Flight."

MESSRS. A. W. GAMAGE, LTD., have been honoured with the Royal Warrant of Appointment to His Majesty the King of Spain.

THE Thornton Engineering Company, Ltd., Belle Vue, Bradford, Yorks., have been appointed district agents for the Sheffield-Simplex cars.

MR. L. SAVORY informs us that he has sold the business of the Westminster Motor-Car Garage, of 17½, Kensington Place, off Page Street, Westminster, and that it will be carried on on the same general lines as heretofore.

THE Aster Engineering Co., Ltd., of Wembley, have taken over the business of the Autoloc Syndicate, Ltd.

MR. W. P. WARREN SMITH, who has for some years been connected with the Argyll Company, has now joined Messrs. C. E. Whittaker, Ltd., to push the new Imperia car.

THOSE of our readers who have not yet had any opportunity of seeing the new gear and differential lubricant "Vasoleum" subjected to a practical test, and who may be desirous of doing so, are invited to send to the manufacturers, the County Chemical Company, Ltd., Birmingham, the name and address of their local motor dealer, when a practical demonstration will be arranged at no expense whatever to the customer.

As compared with the 23,717 motor-cars registered in London, 16,214 are officially reported as having been registered in Germany.

THE necessity of always seeing that the change-speed gear is in the neutral position before starting up the engine was exemplified at Nottingham last week, when, while the chauffeur was turning the starting handle of the car belonging to Mr. Trivett, the vehicle suddenly dashed off, and, after narrowly missing several persons, came to rest in the middle of the shop of an antique dealer.

A SOMEWHAT remarkable item of news has reached us from New York, that the greatly-increased use of motor-cars by American motorists touring abroad has made it necessary to alter the arrangements of the steamers of at least one of the great trans-Atlantic lines. When Americans first began bringing their cars to Europe for touring purposes, they were content to land at Southampton, Cherbourg or Bremen. Now, however, many prefer to land in Italy and then tour northward, embarking for the homeward voyage from one of the northern ports. The distance between decks of the Mediterranean steamers was not sufficient to comfortably accommodate the crates used for some of the covered cars, and now on all steamers of the line in question the distance between decks has been increased nine inches.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, NOVEMBER 28, 1908.

[No. 508.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

TO THE FRIENDS WHO MISSED US.

Our thanks are due to the writers of the many hundreds of letters who have written expressing regret at our absence from the recent Exhibition at Olympia. We are sorry; it was not our fault.

COMMENTS.

The M.P.'s Petition. It is reported that more than a hundred M.P.'s have petitioned the President of the Local Government Board to give heed to the pleas of smaller bodies with regard to the limitation of the speed of cars, and hasten the many inquiries which have been applied for, and which, according to the narrow views of prejudiced persons, have been unduly delayed. More than that, these suggestive Parliamentarians are persuaded that the revision of the existing law cannot be long put off and that its early alteration is most desirable. The overloaded cargo of the Parliamentary vessel is perhaps the best guarantee that can be offered to prove the impossibility of adding the motor problem to the perplexities of M.P.'s for some months to come.

Obstructing Motorists.

MOTORISTS who take action against those persons who seem to delight in obstructing the passage of other people along the highway are generally to be commended. In this category we would place Mr. W. Firth, who has just taken action against a carter who would not give way to his car in the High Road, Brentford. Although the defendant was only ordered to pay the costs, the chairman of the Bench warned carters to remember that they have no right to bait other vehicles. He hoped, too, that the County Council would make a bye-law as to vehicles keeping on the near side of the road.

The Battle of the Seals.

RIVALRY in trade has had many phases, and the issue of coupons by soapmakers, which, garnered at certain seasons of the year, entitled the collectors to presents, is now being emulated, in slightly different form, by some of the sellers of motor spirit. During the Show one firm offered 5s. for every 100 seals that were obtained by users of its petrol; within a few hours, on the other side of the gallery, another bait was being thrown out, viz., of 5s. 6d. for 100 seals—and now we have a letter from a third concern deploring the inducements held out by the other two. The matter has become a subject of correspondence in the daily Press; and we do not incline to the view that this form of rivalry will be appreciated by either the private owners of motor-cars or by the firms engaged in the trade. The collection of pictures from cigarette packets for the beautification, or otherwise, of a young lady's album has been worry enough without the chauffeur getting wasteful in using the petrol so that he may have a whole pocketful of seals representing a monetary value. Both the competitors who indulged in this little joke at the Show have

so well established their reputation without giving prizes that we would hope they will shortly withdraw their offer and go on their way to increasing prosperity without such extraneous aids to the purchase of spirit. No one would complain of a reduction in the price; it is the idea of their giving "something for nothing" that seems to be urged with dubious wisdom.

An Offer that should be withdrawn.

So much for the matter as it concerned the Show. The suggestion that the notion is to be a permanent one should be earnestly considered by all who have the welfare of the industry at heart. Its development would certainly be inimical to the best interests of all parties concerned in the future of automobilism. Everyone can easily see a dozen ways in which chauffeurs would be tempted to extravagance. Makers of cars are endeavouring to secure the economical running of engines, and, in some cases, have given awards to drivers who have assisted the motor trade by running carefully and getting all they can from the resources at their command. To give the drivers a monetary interest in increasing the consumption of petrol is therefore running in direct opposition to the whole trend of things during the last few years. Therefore the innovation, which we are afraid was lightly introduced, and even less thoughtfully imitated, is one to be deplored. We would even go further and condemn it as tapping at the development of the industry at a time when it needs all the assistance it can obtain from records of economical running and moderation in upkeep, both of which desiderata are threatened by offers that will lead to more waste than their authors have imagined.

Strange Bedfellows.

"MISERY," Shakespeare says, "makes us acquainted with strange bedfellows," but nothing more remarkable can be imagined than the Olympian chamber towards which heavy vehicles will drag their ponderous weight along, while aeroplanes heavier than the air, but lighter than the others, will float above the elephantine masses of machinery. Verily it is a strange juxtaposition. True, the heavy vehicles did not attract to Olympia this year; the marine section, which brought a few, "has had its day and ceased to be," but the idea of bringing "fliers" to coquette with steam tractors and heavy vehicles to rub exteriors with aeroplanes is, as my Lord Tomnoddy would say, "quite a new thing." Dr. Johnson would have marvelled at such a terrestrial display of the potentialities of airships combined with the utilitarian purposes of the ponderous heavy vehicle that draws great loads for commercial advantage. Why not seek to give local colour to the show by the introduction of diaphanous clouds through which the aeroplanes could be viewed while standing on the footboard of a tractor?

Cribb'd, cabin'd and confined.

AWAY in the gallery at the motor show at Olympia last week were many useful novelties and recently-introduced accessories for the service of motorists which, unfortunately, were doubtless unobserved by some otherwise prospective buyers. Several of the displays were crowded into small spaces that were really inadequate for the effective display of the variety

of goods shown. The result was that half a dozen people easily made a crowd around a stand, and when this also occurred at one immediately opposite, the progress of passing observers was obstructed, or those intending to examine the points of any particular exhibits were hustled and jostled in a way that did not tend towards a business mood. Exhibitors have some claim to consideration in the matter, and there will have to be limits to the minimum space allowed to exhibitors. Business is often lost owing to the circumstances we have mentioned, and the only way that those who show at these displays can secure the full result of their enterprise is that they shall be allotted ample space in which to dispose their goods to the best commercial advantage, and not be "cribb'd, cabin'd and confined."

Provincial Meets.

WITH reference to the provincial meets of the motoring organisations which have their headquarters in London, Mr. Rees Jeffreys struck a right note at the last meeting of the M.U. committee when he said that the time had come for the introduction of new features in these events. So far there has undoubtedly been a sameness—and we might add, a tameness—about the provincial visits of both the R.A.C. and the M.U. Apparently the feeling of most of the members of the committee was in favour of a three days' meeting instead of three one-day meetings. This would be a reversion to those early tours and

Moreton Old Hall. (See page 841).

meets of the A.C.G.B.I. which did so much for the social side of motoring in the days when it had few friends. With regard to the programme for 1909 it is proposed to hold a joint gathering of the M.U. with the Welsh A.C., and Mr. A. E. Newton has been asked to draw up a suggested tour in connection with this meet, for the entertainment of which the local club is prepared to spend £150. No more varied centre for a motor meet could be found than South Wales and the Wye Valley, and it should be easy to provide a programme of enjoyment and novelty in that district.

The R.A.C. and the Clubs.

THE meeting of the Derby and District A.C. to be held on Tuesday next will be anxiously regarded by those who are following the course of events in what might be called the political side of automobilism. Efforts to weld the various organisations into one homogeneous society have not met with success, and the pacific endeavours of some northern clubs have not brought peace. By requiring its affiliated bodies to restrict their official connection only to themselves the R.A.C. has entered upon a campaign which those who now assist two or more associations regard as of a bellicose character. The attitude of the Derby Club is therefore more than usually interesting. Should the policy recommended by the committee of this virile club be endorsed by the members and followed elsewhere to any extent it will cause some fluttering in

the Piccadilly dovescotes. Of course the R.A.C. will await developments in other directions; but there is much to be said on behalf of those who would allow the local clubs perfect liberty of action with regard to the associations they propose to support. After all, they pay the fees, and if they wish to give threefold help who should say them nay? The R.A.C. organises trials, the M.U. gives legal assistance, the A.A. secures the comparative safety of the roads from overweening police attention. If a club that is concerned with the R.A.C. also wishes to promote either of the two other good works, we do not see why its enterprise should be restricted. At the conference of provincial clubs held at Birmingham it was decided to ask the R.A.C. to reconsider its position on the question—a decision endorsed at a meeting at which the following clubs were represented:—Harrogate and District A.C. (one delegate), Sheffield and District A.C. (three), Derby and District A.C. (three), Midland A.C. (three), Leicestershire A.C. (three), Shropshire A.C. (one), Liverpool A.C. (two), Manchester M.C. (one).

The Motor Union.

THE principal feature at the annual dinner of the Motor Union last week, the proceedings at which are referred to elsewhere in the present issue, was the spirited speech of Mr. Joynson-Hicks, M.P., the chairman of the Union, in which he pointed out that the coming year would be a critical one for motorists owing to the growing hostility they had to face. Nowhere was that hostility more apparent than in the place where it ought least to be—the House of Commons. The future was, however, with the motor-car, and the time had now come when, in his opinion, they could demand as a right the improvement of the roads and the recognition of motorists as occupying a really living place in the body politic. They had been on the defensive long enough; they must carry the war into the enemy's camp and demand as a right the same justice and fairness as was accorded to the other users of the road.

The Motor Mail Van.

IN a few days the last of the horse-drawn mail coaches which travel nightly from London to Guildford will be superseded by a motor-van. And thus the service of the horse for carrying mails through the night will be relegated into historical annals. The way in which the Post Office has tackled the question of the conveyance of the mails has been really commendable. Of course, the motor vehicle will not carry parcels and letters long distances from one end of the country to the other, but within a radius of fifty or sixty miles, or even rather more, will have opportunity of proving its utility. Every provincial town in the future will have its motor mail van to distribute its bags of mails in the villages, and in the organisation of an even quicker service than now prevails the automobile will have a place.

A REMINDER of the passing of 1908 comes with the receipt of a set of date-indicating pads and book diaries for 1909 from Messrs. Hudson and Kearns, Hatfield Street Works, Stamford Street, London, S.E. These are issued in various sizes, all presenting distinguishing features of value for the office desk. The blotting paper employed is of good quality and readily absorbent, and to the left of the pad, in all patterns, is a calendar with postal information, &c., as well as a diary interleaved with blotting paper and an alphabetical index for memorandum, &c. Many of our readers will find the pad known as 8A a useful blotting addition to the desk equipment. This has, in addition to the blotting pad and the daily remembrancer with its weekly tear-off, ample space on the right-hand side for notes, &c., as well as the features already indicated. Even more complete is the bankers' edition, this being a pad of 2 ft. 3 in. in width, and providing within easy reach many things that are necessary for the desk and which cannot be lost or mislaid where such an excellent pad is adopted.

ABOUT NORTHERN STAFFORDSHIRE.

THE Staffordshire district may not seem an inviting locality for the holiday-maker, who has associated the district only with the Potteries, but those who are familiar with the county, particularly the northern section, know full well the delightful roads and beautiful scenery there to be enjoyed.

A reminder of many interesting tours in the locality comes in a new Guide to Picturesque Staffordshire, which has been issued by the North Staffordshire Railway Company, of which Mr. Tonman Mosley is the chairman. Mr. Mosley is an active motorist, and, in fact, was one of the first of the J.P.'s of Buckinghamshire to recognise the value of the motor-car as a social as well as a commercial force. The motorist who intends to tour the district served by the railway system will include Congleton, Biddulph, Alsager, Mow Cop, and Moreton in his itinerary. The Cheshire town of Congleton possesses special interest in the magpie houses that still remain, and although the demand for "improvement" has robbed the place of many of its antiquarian delights, the Lion and Swan Hotel and Ye Olde Black Boy inn preserve their ancient appearance for the delight of the visitor. Several good runs may be taken from Congleton, the ascent to Cloud End, 1,000 feet above the sea level, giving a panoramic view of the surrounding country, including Mow Cop in the prospect.

An artificial ruin on the top of the hill of Mow Cop is a landmark for the surrounding country; and from the summit of the hill a magnificent view is to be obtained of the Cheshire Plain, a well-wooded district interspersed with fields and hedge rows. Alderley Edge, Beeston Castle, Market Drayton, and, with a clear atmosphere, the Welsh Hills, the Wrekin, and Delamere Forest are distinctly visible.

But perhaps the greatest treasure of the district is Moreton Old Hall, a view of which is on page 840. This is an example of

The Archway, Hawkestone Park.

Elizabethan architecture and presents a most picturesque appearance. The moat is rectangular, measuring about 90 yards by 80 yards, and is crossed on the south side by the stone bridge shown in our illustration, the arms of the Moreton family being carved in the centre. The courtyard is unique in this country, and the building is a perfect specimen of the half-timbered house of the sixteenth century. Two magnificent bay windows with

exquisitely leaded glass are immediately opposite the entrance, the black timber in contrast to the white plaster being very effective. The following words may be seen round the upper tiers of the two great bays:—

God x is x al x in x al x things x this x window
x Where x made x by x William x Moreton x in x
the x year x of x oure x Lorde x MDLIX.

On a panel against the ground floor window is the maker's record as follows:—

Rycharde x Dale x Carpeder x made x
thies x by x the x grac x of x God.

"Green Man and Black's Head," Ashbourne.

The long gallery, which measures 70 ft. by 12 ft., is reached by a spiral staircase, and many old relics can be seen in the kitchen, while literary interest is given in the fact that Moreton Old Hall was the "Manor House" of Miss Amelia Edwardes' novel "Lord Brackenbury."

The second route for those wishing to explore the district thoroughly will include Sandon, Weston, Great Haywood, Chartley and Ingestre, a tract of country in which are many great houses, of which Trentham Hall, the splendid residence of the Duke of Sutherland, has first place. Hawkstone Park, about nine miles from Market Drayton and three from Hodnet, has also many interesting memories and natural beauties. Among the latter is the remarkable archway cut through the solid rock. This is reached through the Park after descending the Mound opposite the ruins of Red Castle. Following the descent there is a short distance to be traversed along a cart-road, and, passing under the archway, a winding footpath leads up to the Grotto Hill. Here is a cave supported by pillars hewn out of the rock. It contains a large number of shells and fossils inlaid in the roof and sides. Market Drayton was an old Roman station and has had a place in history ever since Doomsday. The half-timbered houses still standing in its streets give it an interest that is not often found in such busy centres as in this historical locality.

Ingestre Park, the name of which recalls a prominent motorist of the present day, connects Weston and Hixon, a village on the main road from Uttoxeter to Lichfield, where recently great celebrations have been made in connection with the unveiling of the monument to the biographer of Dr. Johnson. Pursuing the journey to Tutbury Castle, the Manifold Valley should on no account be missed. The Manifold Valley is in such close proximity to that of the Dove that there are necessarily many points of resemblance between them. The former is the more impressive on account of the number of high hills on either side, in some cases the eminences rising upwards of 1,000 ft. in height. Beeston Tor, Grindon and Wetton are other places of interest, and then the motorist would do well to make his way to Hartington, Beresford, Dale, Dove Dale, and Ilam, which although not in Staffordshire, are sufficiently near to warrant a day's diversion from the path. They claim association with the North Staffordshire Railway, to whose courtesy we are indebted for the accompanying illustration of the old sign at Ashbourne and the other pictures of interest.

Gossip from Paris.

THE movement in favour of making the Paris Salon a biennial event does not meet with the success some of the leading automobile manufacturers expected. The truth is that the eve of the opening of the great annual show is scarcely the right moment to speak of its suppression. Moreover the question is whether it can be suppressed effectually one year out of two. To do so would require the unanimity of the 650 or 700 exhibitors, or something approaching it, and that unanimity does not seem to exist. An influential gentleman said to me the other day that if by chance the Automobile Club decided not to hold a Salon next year he would at once organise an automobile exhibition for 1909. In the case of the Grand Palais being refused for the show, there were, he pointed out, a dozen other places in Paris at which it could be held. And he added, "Mark my word, it would be a huge success." There is a good deal of truth in this. Those who are satisfied with the position they have attained, and can scarcely hope to improve it by whatever they may exhibit, are, after all, the very small minority, and they have failed to persuade the rising manufacturers or those they call rather contemptuously "the small fry," that it is no use trying to compete with them. No, "the small fry" want an annual show, and will participate in one even if the Automobile Club refuses to organise it. Nothing is eternal, but it does not

Touring in France.—La Canebière, Marseilles.

appear as if the moment had come to transform the annual automobile Salon.

Is the game worth the candle? is the question some of the most renowned French automobile manufacturers have been studying several months in connection with the Grand Prix Race. The Anjou circuit has been chosen for the great international race not because it is the most suitable and convenient but because the local committee was able to furnish the proof that unanimity prevailed in its favour in the district, that the roads would be repaired, and especially that there was a substantial subvention of £4,000. For the Automobile Club the pecuniary risk is therefore not very great, but for the automobile manufacturers participating in it the competition must be very costly. It has been said that in all probability their number will nevertheless be so great that it will be necessary either to have recourse to the unpopular system of an elimination race or to reduce the number of the racing cars each firm may enter for the competition from three to two. Even reduced to two racing cars the cost for the maker is not materially lessened, and several of the leading firms whose position on the market is well established are seriously thinking of suppressing an item of expenditure for which they get no return. For instance, the board of directors of the Panhard Company believe the sale of their cars would not be adversely affected by abstention from the race; Renault Freres are of the same opinion, and I am informed that Dietrich and

Mercedes do not consider the game is worth the candle. Of course, a board of directors can always modify its decision, but at the present moment there is very little probability of a Panhard or a Renault car being seen in the Grand Prix of 1909. And if neither of those firms participate in the great international competition their example may be contagious.

THE decision of the French Automobile Club to occupy itself with aviation and steerable balloons is not distasteful to the majority of the aviators, who complained that their interests had been somewhat neglected. Then the Aero Club and the National Aviation League did not work harmoniously together. The regulations for the very numerous prizes already in the hands of the League were not drawn up by the Club, which I am informed demanded that half the funds belonging to the National Aviation League should be handed over to it. I cannot affirm that this assertion is absolutely correct. However, the report that such was the case made a bad impression. But "All's well that ends well," and every one for the moment pretends to be satisfied with the nomination of the commission composed of members of the Automobile Club, the National Aviation League and the Aero Club. What the commission is to do no one knows exactly. It is supposed to be the pledge for the harmonious working of the three institutions. The National Aviation League contents itself at least for the time being with the collection of the funds. There nevertheless remain two associations each of which aspires to the honour of establishing the rules and regulations of the competitions and races and of presiding over them. It appears that the National League will give its financial support to the Automobile Club, which has appointed a special Aviation Committee and contends that it alone has the right to occupy itself with the heavier-than-air means of locomotion, because it is the new-born child of automobilism—that is to say, of the petrol motor. The Aero Club was founded ten years ago to encourage ballooning, with which the Automobile Club has nothing to do. Consequently the Automobile Club claims to be the rightful paramount authority on all that concerns steerable balloons and aeroplanes of all sorts, because the petrol engine is used to propel them. But it recognises the spherical balloons floating at the will of the wind constitute the exclusive province of the Aero Club. To be thus thrust into the background is very distasteful to the Aero Club, which points out with perfect truth that it is at present the only authority on ballooning and aviation recognised by the International Aeronautic Federation. It is, however, not difficult to foresee that the weakest will ultimately go to the wall.

MARNEY.

MR. JAMES SETON-ANDERSON, whose garage is at 57A, Shepherd's Bush Green, W., is the first to put Spyker taxi-cabs on the London streets. The vehicles are fitted with 10-15 h.p. four-cylinder engines and are luxuriously equipped.

WE learn that Messrs. Boon and Porter, Ltd., of Castelnau, S.W., have recently supplied no less than twenty-three motor-vans of the Renault and Lacre type to Messrs. J. Lyons and Co., Ltd., the well-known caterers. Messrs. Boon and Porter have during the past season made a special feature of the Renault cars, and the sales have been so satisfactory that they are now arranging for a large number of these vehicles for 1909, and already have the new 8-h.p. two-seated model in stock.

A NEW series of motor-car regulations have recently been adopted in Buenos Ayres, they having been rendered necessary by the increasing number of automobiles in the city. Experienced drivers are given a fairly free hand as to speed, but must satisfy the authorities that they are competent by passing a suitable examination. They are also required to carry a duplicate pass book, containing their licence, and blank pages, on which any accident or carelessness is to be recorded by the police. Persons under eighteen years of age are only permitted to run cars up to 12-h.p., and this only after passing a satisfactory examination. As to the cars themselves, they must be provided with non-slipping tyres and efficient brakes.

MY FRIEND GILFILLIAN AND HIS 6½-H.P.

By "Rus."

(Concluded from page 814.)

I usually spend my holidays with Gilfillian, and this year we had chosen St. Andrews, and he had suggested as an additional attraction to golf that he would take the car and that we should travel over in it.

However, after the last exploit I went home and dreamed a dream about our journey to St. Andrews on that car. We were *en route* through Edinburgh down its steepest street, suitably named Pitt Street, but, unlike the other pit, it has a bottom. Gilfillian mistook something else for the brakes and down we went that long thoroughfare at sixty miles an hour, over a low wall at the said bottom into a stream beyond, and were fished out and gathered up and taken to hospital; but, nightmarelike, continued the journey nevertheless to the Granton Ferry, where we went down the slip to get on the steamer. Gilfillian saying that he always did it on his own power, would not let the pier-men interfere. The tide was low, and when he got her on the stones covered with slimy seaweed she skidded past the gangway and into the sea at the bottom of the slip. Again we were rescued, and taken this time home, where I presently awoke.

"Gilfillian," said I next day, "about that holiday. I suppose the car won't be repaired in time?"

"Oh! won't it," said he, "I'll see to that."

"Gilfillian," I replied, "I feel I am trespassing on your generosity. I have no motor and so cannot return the compliment."

"My dear sir, you rate me very low. You are my friend, and therefore I am glad to give you any little pleasure I can. A return does not enter into my mind."

"Of course," said I, "it will be great pleasure to have the motor with us. By the way, do you know an awfully good way to get to Granton—avoiding the steep gradients of Edinburgh—is to skirt the town on the west side and get along to Granton on the Queensferry Road."

"Yes, I know that way—a sort of 'lubber's hole' as they say in the Navy, but why not take the direct road? The brakes are good enough, aren't they?"

The brakes were no doubt good enough, I thought, but what about the brakesman—the breaker he might suitably be called.

"Gilfillian," said I, "I am afraid I can't get away for that trip at the time, but you go, and if—when—you arrive you will let me know, I'll try and get off, and come by train." I hope I substituted the "when" for the half murmured "if" without him noticing. I would feel just wretched if I thought I had hurt his feelings; besides, there's a new doctor started just a few doors away.

"Not at all," said he; "I wouldn't enjoy that lovely drive through Edinburgh and Fife a bit without you. I can wait a day or two, my time is my own."

There seemed no way out of it now. It wanted ten days yet till we were appointed to go.

But every night till then I found myself bound, Mazeppa-like, to that blessed car in wild career down Pitt Street, Gilfillian laughing the wild laugh of a maniac—every night we charged that low wall at the bottom, crashed over it and came suddenly to rest in the bed of the Water of Leith, then to hospital and at the same time on the road again, and sliding and skidding down that slippery, squeezy, slimy slip, and into the deep and turgid waters of Granton Harbour—awakening in the morning racked and wearied, as one who has come out of a delirium.

Mazeppa had had at least a flirtation with the wife of his tormentor, but what had I done to Gilfillian? How can you persuade a man, without offence, that what he wishes you to do is not the good turn he thinks it is?

I consulted another friend, an expert in such matters.

"Do you believe in dreams?" I said.

"Sometimes," he replied, "but nightmares twice repeated are always true."

"Always?" I tremulously queried.

"Always," he responded with oracular and fatalistic solemnity.

Well, the fateful morning had come at last; Gilfillian was to call for me at 8.30. My luggage was ready, but, with all my preparations, how unprepared I was. What I really needed was a priest to give me absolution.

How fast the minutes went during breakfast. A swollen thorax refused to allow me to swallow anything, not even tea.

It was half-past eight—there it rang. The door-bell went at the same time. Was it the hangman and his procession to lead me to the scaffold or Gilfillian to take me for—a holiday? For the only time in my life I took a drink of brandy in the morning, and a good big one, too, my paralytic hands filled out.

The door opened—not Gilfillian but my servant appeared and handed me a telegram:—

"Sorry motor ran over a bridge last night, twenty miles from home; repair impossible. Meet me Waverley Station 9.30, and go by train. Gilfillian."

Flinging both hands towards Heaven I shouted, "Saved! Saved! Saved!!!"

The astonished servant bolted from the room, knocking over my best breakfast service in his blind rush; but what matter a trifle like that to me at such a moment as this?

We went to St. Andrews, and of Gilfillian as a golfer there is much to say; but that is another story.

LIEUT.-COL. HOLFORD, Equerry to H.M. the King, has placed an order for a 28-35-h.p. Fiat motor-car with limousine body.

"Motor ran over a bridge."

CONTINENTAL NOTES.

The Paris Salon.

The annual Paris Salon will be opened in the Grand Palais on the Champs Elysees to-day (Saturday) by M. Fallieres, the President of the French Republic. The 1908 show is being run on quite new lines; hitherto the pleasure cars (1) and the industrial vehicles, motor-boats, machines, tools, &c. (2) have been shown concurrently, the first section in the Grand Palais and the second group in annexes. This arrangement not having given general satisfaction, two separate exhibitions are this year being held in the same building; the one which opens on the 28th inst., and which will run to December 13th, being confined to pleasure cars and cycles, while that for heavy vehicles, motor-boats, &c., will run from December 24th to the 30th. Although many of the new models of the leading French builders have already seen the light at Olympia, the Salon is expected to

Belgian Motor-car Imports and Exports.

Returns just issued show that the value of the foreign motor-cars and parts imported into Belgium during the ten months ending with October last amounted to only £122,156, as compared with £142,764 in the corresponding period of last year. On the other hand, there has been an increase in the exports of Belgian motor-cars and parts—from £368,856 in the first ten months of 1907 to £396,584 in the similar period of the current year.

Aeronautical News.

The French Chamber has adopted a supplementary credit of £4,000 for the encouragement of aviation, and a motion in favour of conferring the Legion of Honour on French and foreign aeronauts who carry out their experiments in France.—The Wright aeroplane was taken up and piloted without Mr. Wilbur Wright for the first time on Tuesday last week. The aeroplanist was

A View on the Anjou Circuit, on which the A.C.F. Grand Prix Race is to be held next year.

be fertile in novelties and interesting features, a description of which will be given in the next issue of the *M.C.J.*

The A.C.F. Grand Prix Race.

A good many French and foreign racing car drivers have already gone to the Anjou circuit to examine and to "try it." There is certainly no reason why they should not examine it as minutely as they like, but the local authorities do not seem disposed to let them "try it," at least in towns and villages. Foreseeing the inevitable excess of speed which will, in spite of all rules and regulations, be indulged in, the mayors of the communes through which the circuit runs have agreed not only to issue decrees prohibiting, for all sorts of vehicles, a speed of more than 11½ miles an hour, but also to take the necessary measures to secure the punishment of all who may violate the regulation. English drivers, when they come over to visit the circuit, should remember this, especially as great tolerance will be exercised on the roads not bordered with houses or cottages.

Count de Lambert, who successfully made two flights of fifteen minutes each.—Mr. H. Farman has transformed his aeroplane into a tri-plane, and a few days ago made two flights of between three and four miles each, flying at a height of between 50 ft. and 60 ft.—On Friday last week Colonel Lowther, the British Military Attaché, accompanied M. Clement for a trip in the dirigible balloon, Clement-Bayard, over Paris.—M. R. Esnault-Pelterie's aeroplane, piloted by M. Chateau, made a successful flight of 316 metres on Saturday last.

Miscellaneous Items.

So far ten entries have been received for the competition of tyre-inflating devices which is to be held by the French Automobile Club on the 7th and 8th prox.—A company has been formed in Amsterdam to introduce a service of motor taxicabs in that city.—A motor volunteer corps is being formed in Roumania.—Negotiations are again in hand for the construction of a large motor racing track in the neighbourhood of Spa, Belgium.

THREE years ago there was not a single motor-car in Uruguay, but according to a recent return there are now 138 in use.

THE City Diary for 1909 is issued by Messrs. W. H. and L. Collingridge. This is now in its 46th year of publication and is a capital work of reference as to the affairs of the City of London as well as a useful diary for the office.

FROM the Daimler Motor Company comes a copy of the first number of the Daimler Bulletin, which contains a reprint of Mr. Knight's paper on the new Daimler engine, an article on Ireland from the motorist's point of view, and many other items of interest.

THE St. Catherine Press, Ltd., send a series of little guides to various places of interest, including Tain, Cullen, and Kirkcudbright, in the north of Britain, and Devonport, in the south. These are well printed and illustrated, and copies can be obtained free on application to the Town Clerks of the respective towns.

NOTICING that there exists a demand for a good light, cheap car, and as the lowest power in which Germains are made is the 14-22-h.p. model, Capt. Theo Masui has taken up the sole representation for the United Kingdom for the Gregoire light cars, which will in the future be known as the "Gregoire-Gordon."

THE next conference of representatives of National Automobile Clubs will be held on Monday next at the French Automobile Club. We understand that the R.A.C. will again put forward its proposition for the establishment of a definite system, whereby records made under certain approved conditions will be accepted by all the federated clubs as world's records.

THE Coachmakers and Coach-Harness Makers' Company of London are offering a number of prizes for competition among British subjects engaged in the coach and coach-harness making trades and members of technical classes in connection therewith. The competitions include designs for a limousine motor-car body and a four-seated open motor-car body, and essays on decoration for modern carriages.

THE members of the staff and agents of the Star Engineering Company who were in attendance at the company's stand at Olympia were entertained on the evening of Friday last to supper at the invitation of Mr. E. Lisle, sen., the managing director. The party met at Frascati's after the close of the show. Mr. E. Lisle, sen., was in the chair, and amongst those present were Messrs. J. Goodman, J. Lisle, F. Goodwin, H. Goodwin (London) R. Lisle, H. Herbert, and W. Collins (Leicester). A most pleasant time was spent and the occasion served to cement more firmly than ever the pleasant relations existing between the firm, its staff and agents.

AMONG the many useful publications issued by Messrs. Hans Renold, Ltd., Progress Works, Manchester, that entitled "Renold Driving Chains and Their Uses," a copy of which has just reached us, will take a prominent place. The book, which extends to about 120 pages, is not a mere catalogue—indeed, prices and sizes have been left out—but is intended to serve an educational purpose by giving illustrations and particulars of some of the many uses chains are now being put to in all branches of engineering. The work is divided into three parts, the first dealing with the principle of chain gearing, the three types of chains mostly used, the types of sprockets used, and the tools for making them; the second illustrates the chains in use in the Renold chain factory; while the third shows various applications of chain driving, including the driving of textile calenders, engine governors, pumps, saw benches, radial drilling, or for printing machinery, &c. Established in 1879 in a small room, the Renold chain business has progressed to such an extent that it now comprises two large works with over seven acres of floor space, and gives employment to about 700 persons. Last year the company turned out chains to transmit over 30,000-h.p. for general engineering purposes, in addition to over 50,000-h.p. for driving bicycles and motor vehicles.

It is announced that the Russian-Baltic Wagon Works of St. Petersburg are taking up the construction of motor-cars.

THIS week the motor-car is much *en evidence* at Chichester, the Prince and Princess of Wales being on a visit to Mr. and Mrs. Willie James at West Dean Park. Many of the guests invited to meet their Royal Highnesses arrived in their automobiles.

IN the course of our report of the Olympia Show our readers will have noticed several references to engines in which the crankshafts are *desaxé*, or, in other words, set slightly forward of the centre of the cylinders. The object of this arrangement has already been explained in these columns, but, as we are able this week to reproduce an illustration which has lately been issued by Messrs. Thos. B. Jeffery and Co., the makers of the American-built Rambler cars, and which very clearly shows the advantage that is gained, the following further reference to the matter will not be without interest. The firm in question have taken for purposes of comparison an ordinary bicycle and a petrol engine. As the diagram shows, the best position for the pedals to receive the first downward stroke of the rider's foot is just slightly forward of the centre of the

crank shaft of the bicycle, as shown on the right. If he mounted when the pedal was immediately over the centre of the bottom bracket spindle, as seen on the left, his weight would fall directly on the bearings and the first downward stroke would be retarded, and, therefore, weak. Now imagine the man's leg as the piston of the engine, the pedal of the bicycle as the crank pin and the bottom bracket spindle as the crank shaft of the motor. In the ordinary engine the crank pin and piston (the pedal and the man's leg) are directly over the dead centre, and until the crank passes the turning point all effort is wasted. Thus, when the explosion occurs, the greatest force falls upon the bearings. In the case of a *desaxé* crank shaft, at the instant the explosion occurs the crank pin has moved past the dead centre, the crank shaft being in a position to receive the full pressure and turn without friction. Consequently there is no side thrust of the piston on the cylinder walls, with a consequent saving of wear on the latter.

ON Tuesday a good send-off was given to Messrs. Gamage's Christmas bazaar—one of the sights of London so far as the juveniles are concerned—when the head of the firm invited his friends of the Press to an inauguration luncheon. Motoring in miniature is likely to be attractive in Toyland this season, while the serious side of the subject so far as the adults are concerned will be fully maintained in the comprehensive stocks of accessories both in Holborn and Cheapside.

THE OLYMPIA SHOW.

(Continued from page 833.)

Fig. 68.—The Turner-Miesse 10-h.p. Four-Seated Steam Car. (See page 773 issue November 7th).

THE TENDENCY OF DESIGN—A PLEA FOR GREATER SIMPLICITY.

IN our last issue we gave a brief summary of the tendencies of design in motor-cars as exemplified by the vehicles on view at the annual Show at Olympia, which was brought to a close on Saturday last. In concluding our review of the Exhibition we cannot help giving expression to a feeling that, generally speaking, there is still room for considerable simplification

the production of cars which, while giving satisfactory results on the road, shall have a minimum number of parts and consequently be less costly to produce than is now the case. Pressure on our space at the present time prevents our going so fully into the matter as we would like, but reference may be briefly made to a few points to which we consider the attention of those responsible for the design of automobiles might usefully be directed.

Fig. 69.—The Piccard-Pictet 28-50-h.p. Four-Cylinder Car. (See page 850.)

in motor vehicles. While at the present time there are a few machines on the market which set a laudable example in the direction we have in mind, a careful inspection of many of the chassis exhibited last week almost leads one to imagine that designers have given more attention to the provision of work for the machine and fitting shops than to

In the first place, we may allude to the water circulating system of petrol engines. Seeing that even motors of high power racing cars can be kept sufficiently cool on the thermo-syphon system, why do the majority of firms still continue to employ water circulating pumps and their necessary complications? We have heard it argued that there is nothing to be saved by dis-

carding the pump—that the extra capacity of the radiator required with a natural system of water circulation equals in cost that of the pump, and that the power required to drive the latter is a negligible quantity. Even granting both points, we still maintain that there is a distinct gain in simplicity, which should be the object aimed at.

Turning from the engine to the means adopted to transmit the power of the same to the rear road wheels, we are not surprised to find that the erstwhile much-maligned leather-faced cone clutch is again beginning to be more widely used. Disc clutches, while they may possess certain good qualities not possessed by the older type, have only followed the natural order of things in having these advantages accompanied by certain drawbacks, and certainly, from the point of view of fewness of parts, they compare badly with the relatively simple leather cone. And then as to the change-speed gear? Time was when we were led to expect that the modern wonderfully "flexible" engines—that is, motors capable of "pulling" between a very wide range of rotative speeds—would render gear-boxes practically unnecessary; that, owing to it being possible to "crawl" on the top speed, the only thing that was necessary was a reverse motion and perhaps a low speed for starting purposes on exceptionally steep hills. But what do we find to-day—that instead of the number of speeds in the gear-box being reduced, six-cylinder cars—the cars which are claimed to be possessed of flexibility in the highest degree—are practically all being provided with four speeds, the maximum so far adopted. We do not, of course, forget that the builders of one six-cylinder vehicle have in their new touring model made a start towards the desired simplification, but that there are further developments to come in this direction no doubt can be entertained.

Although great credit is due to engineers for the ingenuity they have displayed in overcoming the many problems connected with the production of motor vehicles, we are inclined to think that the ingenuity has hitherto been associated more with complexity than with simplicity, and that, although our views may not meet with universal approval, the time has come when a distinct change in methods in the draughting department of our automobile factories is not only desirable but in the best interest of the industry.

C. J. W.

The Remo Cars.

For the 1909 season the REX MANUFACTURING COMPANY, LTD., are turning out two sizes of the Remo cars—16-h.p. and 20-h.p.—the bore and stroke being respectively 86 mm. by 110 mm., and 90 mm. by

110 mm. Except for certain detail improvements, notably as regards the lubrication, the vehicles remain practically the same as last year. The engines comprise four separate cylinders, with the valves arranged on opposite sides. The water circulating pump and high tension magneto are gear driven off the half-time gear, through shafts provided with universal joints. To render the engine as quiet as possible, the valve tappets are kept continuously in contact with the valve stems

by means of a spring; to the same end, the tappets are provided with hard fibre tops. The carburettor is of the T. and M. triple-jet automatic type, provision being made for the engine to draw in, when the throttle is closed, a supply of pure air, so enabling it to act as a brake, and also to be kept as cool as possible. The transmission is through a leather-faced cone clutch and three-speed gear-box, giving a direct drive on the top to the rear live axle. The latter is of a special strong construction, $\frac{3}{4}$ in. ball bearings being fitted to the main bevel wheel and differential gear. Space prevents reference to other details of the cars. It may, however, be mentioned that they are throughout on modern lines, ren-

Fig. 71.—View of Engine and Gear-Box of Adler 12-h.p. Car.

dering the Remo vehicles well worthy of the attention of those looking for a reliable machine at a reasonable price. One of the standard side-entrance double phaetons on view was fitted with a new Cape-cart hood and wind screen, recently brought out by the Rex Company. A feature of the hood is that it is extended further over the front seats than usual. It also has side wings, so that the rear part of a four-seated body can be quite enclosed, there being a celluloid window in that part of the side screen which comes over the door. Similarly, the side screen extends towards the front of the extension over the driver and protects him from side draughts. The other feature is the tilting glass wind screen, which can be set at any angle, and affords considerable protection against wet in combination with the extended Cape hood. When the hood is folded back, it takes up no more space than the ordinary Cape-cart hood.

The Adler Cars.

The novelty of the exhibit of Messrs. MORGAN AND CO., LTD., London, was the new Adler 12-h.p. four-cylinder car. The engine, which has a bore of 75 mm. by 88 mm. stroke, is, as shown by Fig. 71, bolted up to the gear-box in such a way that they form a single unit. Two systems of ignition are fitted, while the lubrication is maintained by a pump driven off the rear end of the cam shaft. The transmission is through a metal-to-metal cone clutch and a three-speed gear-box, giving a direct drive to the live-axle on the top speed. The change-speed lever is of special construction, enabling the speeds to be changed without touching an intermediate gear. For the first speed and reverse motion a handle on the top of the lever has first to be turned, while for the second and top speeds the lever is simply moved forward and backward in the usual way. A noteworthy feature of the new vehicle is the accessibility of all its parts, they being so arranged that they can be readily and rapidly taken to pieces and reassembled. The car is made in two lengths of wheel base, the longer one being intended to receive a four-seated body, while the short chassis is designed to furnish a speedy two-seated touring car. In addition to the above, a 7-h.p. (R.A.C. rating) chassis, with two-cylinder vertical engine, bore 75 mm., stroke 100 mm., with magneto ignition, is also being made; like the 12-h.p., this car can also be fitted with either a two or four-seated body. Examples of the Adler 20-h.p. and 40-h.p. cars were also on view, all being equipped with Morgan bodies, of which a limousine was a notable example.

The Benz Cars.

Examples of the Benz cars were shown by BENZ MOTORS, in the 28-h.p. and 40-h.p. sizes, the former being exhibited with a double landaulet body. These have each four-cylinder engines, the cylinders being cast in pairs. Power in the 40-h.p. chassis is transmitted through a leather cone clutch to the gear-box, having four speeds and reverse, working with a "gate." The 28-h.p. vehicle is fitted with a live axle.

C

The Hotchkiss Cars.

A brief reference has already been made to the Hotchkiss cars exhibited by the British agents, the LONDON AND PARISIAN MOTOR COMPANY, LTD. We are now able to give an illustration (Fig. 72) of the chassis of the 20-30-h.p., which forms a new model for the 1909 season. The engine comprises four cylinders, 110 mm. bore by 130 mm. stroke, cast in pairs, with the valves all operated off a single cam shaft. Plain bearings are fitted to the crank shaft, in place of the ball-bearings formerly employed. The ignition is by high-tension magneto of the Eisemann type, while the lubrication is maintained by a mechanical lubricator on the dashboard driven by an eccentric off the cam shaft. The carburettor is of a special design; the jet, which is readily detachable, is located in a horizontal position, the petrol emerging through a series of holes in the side. As the throttle is closed, some of these holes are covered by a sleeve and the supply of spirit reduced to the desired quantity. One of the holes is, however, always uncovered, so that when the engine is running light just sufficient petrol is supplied to keep it turning slowly. The clutch is of the leather-faced cone type, and entirely closed in; the gate-controlled gear-box gives four speeds, with direct drive on the top speed to the live axle; the cardan shaft is provided with universal joints at each end. The rear axle casing is formed of two tubular arms, which are bolted at their inner extremities to a steel case containing the bevel and differential gear, the upper portion of the case being easily detachable for inspection purposes. The rear axle is a very well designed piece of work; all the parts run on

system. The power is transmitted through a leather-faced cone clutch, three-speed gear-box, to a live axle. A feature of the brake system is that the usual order is reversed, the pedal actuating the brakes on the hubs of the rear road wheels, and the hand lever that located at the rear of the gear-box. A similar car, but with a single-cylinder engine, is also being manufactured by the Delage Company.

The Gaggenau Cars.

The GAGGENAU MOTOR VEHICLES COMPANY exhibited an example of their 18-22-h.p. four-cylinder chassis, in which there are many points of interest. The four cylinders (85 mm. bore by 115 mm. stroke) are all in one casting, and the crankshaft is *desaxé*. The magneto and pump, both of which are easily detachable, are driven off a cross shaft at the front part of the engine. The clutch is of the multiple disc type. The gear-box is gate controlled, and the joints of the cardan shaft are provided with metal covers. The Gaggenau 28-32-h.p. engine is an interesting production. All the valves are located in the cylinder heads, being operated by an overhead camshaft.

The Martini Cars.

Much interest was shown in the chassis of the new 12-h.p. Martini two-seated car displayed by Messrs. HILLS-MARTINI AND Co. The vehicle is fitted with an engine having the four cylinders, 63 mm. bore by 90 mm. stroke, all cast *en bloc*; the valves, which are located in the cylinder heads, are operated by an overhead cam shaft. The lubrication is maintained by a gear-driven pump, while the water circulation is on

Fig. 72.—Chassis of new Hotchkiss 20-30-h.p. Car. The engine, which comprises four cylinders cast in pairs, 110 mm. bore by 130 mm. stroke, develops about 40-h.p.

ball-bearings, large ball thrusts being also provided to take up the end thrust on the bevel pinions and crown wheel.

The Delahaye Cars.

Three models—12-16-h.p., 18-24-h.p., and 25-35-h.p.—were staged by Messrs. DELAHAYE AND Co. Principal interest centred in the 12-16-h.p. vehicle, the four-cylinder engine of which is of an exceedingly "clean" design. The cylinders, together with the exhaust and admission piping—or rather, passages—are cast in one piece. The change-speed gear control is also on somewhat novel lines, the sector being a combination of a straight through quadrant and "gate," the various speeds being obtained by two sets of sliding pinions.

The Delage Cars.

The LONDON AND PARISIAN MOTOR COMPANY, LTD., who have taken up the British agency for the Delage light cars, had one of these interesting little vehicles on view. The vehicles are of French construction, and have recently come into great prominence by reason of their success in various speed contests, notably by winning the Grand Prix des Voiturettes in July last. The car is a replica in miniature of a high-powered vehicle. The engine, which is rated at 10-h.p., comprises four cylinders, all in one casting, and with the valves all operated off a single camshaft. Inlet and exhaust passages are cast as part of the cylinder water-jacket, thus doing away with a considerable amount of piping and joints. The ignition is by a Simms-Bosch high-tension magneto, and the water circulation on the thermo-syphon

the thermo-syphon system. The power is transmitted by a disc clutch, running in oil, to a gate-controlled gear-box giving three speeds with a direct drive on the top, and so arranged that when the through drive is in operation the layshaft remains idle. Examples of the Martini 16-h.p. and 20-h.p. vehicles—the latter being fitted with a single landaulet body—were also on view.

The Spyker Cars.

Owners of Spyker cars will be pleased to learn that the Dutch firm have surmounted their recent financial troubles, and that by the introduction of a new board of directors and of fresh capital the business has now been placed on a sound financial basis. Temporary premises have been established at 64, Wellington Road, N.W., with Mr. F. F. Wellington as representative. The Spyker display in the Annexe comprised a 30-40-h.p. touring car, a 10-15-h.p. runabout, and a 10-15-h.p. landaulet. The latter is especially designed for town use, and is similar to the cabs the company are now introducing on the London streets. The motor comprises four cylinders (80 mm. bore by 90 mm. stroke) in one casting. In order that overheating troubles shall be obviated, a very large honeycomb radiator is employed. The ignition is by high-tension magneto, and, as the point of firing is fixed, only one lever is provided on the steering wheel. The lubrication of the motor is so arranged that it is impossible for over-lubrication to take place, the emission of obnoxious smoke being consequently prevented. The "gate"-controlled change-speed gear gives three speeds forward and a reverse; the final transmission is by a cardan shaft and bevel gear to a live axle.

The Austrian Daimler Car.

A newcomer to the English market is the AUSTRIAN DAIMLER MOTOR COMPANY, LTD., who displayed on the stand of the Electric Vehicle Company a 20-30-h.p. chassis, in which a number of interesting features are incorporated. The engine comprises four cylinders, cast in pairs. The ignition is by low-tension magneto in connection with the Bosch "candles," or magnetic plugs. The transmission is through a four-speed gear-box, cardan shaft, and bevel gear, to a live axle. The propeller shaft is enclosed in a casing which acts as a torque rod. The forward end of the shaft is supported in a Y-shaped member anchored to the frame. Four brakes are available, the usual pair working on drums attached to the back wheel hubs being supplemented by two separately actuated foot brakes at the rear of the gear-box.

The Mass Cars.

The MASS CAR DEPOT, of 71, Ladbroke Road, Notting Hill, W., displayed examples of four of the sizes of the latest Mass cars; these include 15-h.p., 20-h.p., 24-30-h.p., and 30-40-h.p., all fitted with four-cylinder engines. The 20-h.p. is a new model, the engine comprising four separate cylinders, 4 5/16 in. bore by 5 in. stroke. The ignition is by high-tension magneto, while the lubrication is maintained by a plunger pump, which draws the oil from a pump in the base chamber to a small reservoir on the dashboard, whence it is conveyed to the main bearings and through the hollow crank shaft to the big ends of

bore by 100 mm. stroke) are cast *en bloc*, with the valves all on one side. The crank shaft, as in the larger type, is slightly out of line with the centre of the cylinders, but in this case long plain bearings are employed. Of the Imperia cars it may be briefly said that the makers' object has been not so much to turn out vehicles containing wide divergencies from standard lines, but rather machines in which special attention has been paid to the selection of the material of the various components, and which from the point of view of reliability and low cost of upkeep should give the highest satisfaction.

The Cadillac Cars.

The ANGLO-AMERICAN MOTOR CAR COMPANY, LTD., staged several of the well-known Cadillac 10-h.p. single-cylinder cars, including a two-seated runabout, fitted with hood, suitable for doctors' use, and a four-seated touring car. The principal novelty was, however, the new 26-30-h.p. vehicle, fitted with a four-cylinder vertical engine, 4 in. bore by 4 in. stroke. The crank shaft is slightly *desaxé*; that is, out of line with the centre of the cylinders. Two systems of ignition are fitted; both foot and hand control of the throttle are provided; the clutch pedal being also connected up with both the throttle and the ignition, so that as the clutch is released the speed of the engine is cut down and the ignition retarded simultaneously. The change-speed gear is of the sliding pinion type, giving four forward speeds, a notable feature being an arrangement whereby the clutch cannot

Fig. 73.—Plan of Chassis of Mass 15-h.p. Car.

the connecting rods. The transmission is through a gate-controlled gear-box giving three speeds, and cardan shaft and bevel gear to a rear live axle. The universal joints are of a special type, the pins being provided with renewable screwed-in bushes. Of the complete cars on view, an exceedingly interesting one was a 20-h.p. two-seated car designed for touring purposes; this is provided with a hood, a large luggage platform at the rear, a petrol tank of extra capacity, and a cradle for carrying a couple of spare tyres.

The Imperia Cars.

The Belgian-built Imperia cars, for which Messrs. C. E. WHITTAKER, LTD., have recently taken up the British agency, made their first appearance at the Olympia Show. Prominence was given to a chassis of the 16-20-h.p. model. The feature of the four-cylinder engine (90 mm. bore by 120 mm. stroke) is that both the cam shaft and the crank shaft—which is *desaxé*—run on ball bearings. The various details of the motor are on up-to-date lines, and include a pump system of lubrication. The transmission follows the usual lines of live axle cars, the clutch being of the Hele-Shaw type, and the gate-controlled gear-box gives a direct drive on top. For the coming season a new 12-h.p. Imperia car is being introduced. Messrs. Whittaker were, however, not able to exhibit a complete vehicle, but had on view the engine and gear-box, which are built up together in such a way as to form a unit in which all the control gear, including the clutch and brake pedals, are embodied. The four cylinders (75 mm.

be let in until the desired pair of pinions are in full engagement. The final transmission is by cardan-shaft and bevel gear to a live axle. The vehicle on view was fitted with a roomy side-entrance touring body.

The Thornycroft Cars.

The chief novelty at the stand of Messrs. JOHN J. THORNYCROFT AND Co., LTD., was a new 18-h.p. car, a chassis of which was shown. This is fitted with a four-cylinder engine, 95 mm. bore by 114 mm. stroke, having all the valves operated off a single cam shaft. Ignition is by high-tension magneto, and the lubrication is maintained by means of a pump located in the crank chamber. The thermo-syphon system of water circulation has been adopted, a current of air being drawn through the radiator by the fan-shaped arms of the flywheel. The clutch is of the multiple disc type, a noticeable feature being the neat design of the disengaging gear. The gear-box is adapted to give three speeds, with a direct drive on the top to the live axle. The casing surrounding the latter is of special construction, consisting as it does of a single forging. The portion which encloses the differential and bevel gear is closed by means of detachable covers, enabling the internal mechanism to be readily inspected or removed in case of necessity. Other cars on view included a 30-h.p. four-cylinder standard touring car, with Cape cart hood and wind shield, a 30-h.p. three-quarter landaulet, and a 45-h.p. six-cylinder chassis, these models, except for minor details, remaining unchanged from the 1908 types.

The Argyll Cars.

Many visitors to the show regretted the absence of ARGYLL MOTORS, LTD., of Alexandria, N.B. The company had fully intended to exhibit their latest models, but were unable to do so owing to a dispute with the S.M.M.T. with regard to the space. Special attention is just now being paid to a 12-14-h.p. vehicle, designed to meet the demand for a small, light, speedy, and good hill-climbing machine. The feature of the vehicle is that the engine and gear-box are built up in the form of a single unit. In fact, it will be seen from Fig. 75 that the steering gear, pedals, and the foot-brake are also part of the *bloc*. The

Fig. 74.—The Back Axle of the Argyll 12-14-h.p. Car.

engine comprises four cylinders, 80 mm. bore by 100 mm. stroke, cast in one piece, with the valves all operated off a single cam shaft. The carburettor is placed on the opposite side, the mixture being led to the valve pockets through passages cast between the cylinders. The ignition is by high tension magneto. The crank-shaft is mounted on ball bearings, while those of the big ends of the connecting rods are lined with white metal. The water circulation is on the thermo-syphon system, while a gear-driven pump maintains the lubrication. The transmission is through a clutch of the flat plate type, gate-controlled three-speed gear-box, giving a direct drive to the live axle. The latter (Fig. 74) is modelled on the lines of that fitted on the 40-h.p. Argyll. The special feature is the centre casting, which is made without any vertical or horizontal joint, thus ensuring great strength. The casing at the rear allows the crown wheel and differential to be taken out without disturbing the back axle. The driving bevel spindle runs on ball bearings, and is enclosed in a separate casing at the front end, and is also readily accessible. No brazing or flanges are employed, the tubes being shrunk and pinned into the casing direct. The road wheels run on ball bearings carried on the sleeve, leaving the rotating shafts of the live axle to only transmit the drive. A substantial torque rod is fitted to relieve the springs and axle of unnecessary strains. There are a number of interesting features in the car, which has a wheelbase of 8 ft. 3 in., and which, it may be added, is similar to that which secured a gold medal in its class in the 1908 Scottish Reliability Trial. The company are continuing the manufacture of the 40-h.p. and 14-16-h.p. Argyll cars, the only modification in them being the adoption on the last-mentioned of a back axle on similar lines to that illustrated in Fig. 74.

The Piccard-Pictet and Rochet-Schneider Cars.

Messrs. DONNE AND WILLANS, LTD., showed two sizes of the Swiss-built Piccard-Pictet cars, for which they are the British agents. The vehicles on view comprised chassis of the 28-40-h.p. six-cylinder, and 18-24-h.p. four-cylinder types, as also an 18-24-h.p. touring car, with detachable wire wheels. The feature of the design is that the engine, clutch and gear-box are built up so as to form a single unit, which is supported directly on the side members of the pressed steel frame. The engine has the cylinders cast in pairs, with the valves arranged on opposite sides. A special design of automatic carburettor controlled both by hand and foot levers furnishes the mixture, while a new feature is the provision of a small pump for effecting the lubrication of the engine. The clutch is of the metal-disc type, and the "gate"-controlled change-speed gear gives four speeds with direct drive on top, through the cardan shaft and bevel gear to the live axle. The latter is of an excellent design, and is provided with pressed steel torque bar, extending from the differential case to a cross member in line with the forward universal joint; it is hinged to provide for lateral as well as vertical motion. Of the well-known Rochet-Schneider cars, a 16-20-h.p. live-axle chassis, in which the design is, generally speaking, unchanged from

last year, was displayed. The four-cylinder engine, 100 mm. bore by 120 mm. stroke, is provided with high-tension magneto ignition, and a new carburettor known as the Zenith, which is of novel design. The petrol supply is pressure fed, while the gear-box is arranged to give four speeds forward in place of the three previously fitted.

The Riley Cars.

Three different models—9-h.p., 10-h.p., and 12-18-h.p.—were exhibited by the RILEY CYCLE COMPANY, LTD., Coventry, all being fitted with V-type two-cylinder engines. The 9-h.p. two-seater, with single chain drive, remains unchanged in its general design. The 12-18-h.p. car, which can be fitted with either a closed or open side-entrance body, also shows but little change from last year. The ignition is by coil and accumulators with a high-tension distributor, provision being also made for readily installing a magneto. A new model was seen in the 10-h.p. two-seater car, the general arrangement of which is similar to the 12-18-h.p.; the engine, 96 mm. bore by 96 mm. stroke, is fitted with a pump system of lubrication, the water circulation being, however, by thermo-syphon. The power is transmitted through a leather-faced cone clutch to the Riley patent three-speed gear-box, in which the gear-wheels are always in mesh, the various pairs of pinions being brought into action by dog clutches. The final drive is through a cardan shaft (with enclosed joints) and bevel gear to a live axle. A feature of the Riley cars lies in the road wheels, which are so arranged as to be readily detachable, the system being applied to both wire and artillery pattern wheels.

The Zedel Cars.

Since the BRITISH AUTOMOBILE COMMERCIAL SYNDICATE, LTD., took up the agency for the Zedel cars the vehicles have met with a well-deserved popularity. Two models are being made, 10-12-h.p., and a

Fig. 75.—Two Views of Argyll Combined Engine and Gear-Box.

15-h.p. Except for minor details, no changes have been made from the 1908 cars, which have given general satisfaction. The 10-12-h.p. engine has the four cylinders all in one casting, with the valves arranged on opposite sides. The ignition is by high-tension magneto, and pump lubrication is adopted. The clutch is of the multiple-disc type, and the drive is through a "gate"-controlled three-speed gear-box and cardan shaft to a live axle. A feature of the engine of the 15-h.p. car is the carburettor, the automatic air valve of which is controlled by a balance wheel, dispensing entirely with springs. Among the complete cars on view was a 10-12-h.p. two-seater victoria and a 15-h.p. coupé-limousine.

The Brasier and Unic Cars.

Considerable interest was shown in the first of the new Brasier 10-12-h.p. cars with landaulet body exhibited by Messrs. MANN AND OVERTONS, LTD. The two-cylinder engine has a bore of 90 mm. by 120 mm. stroke. The valves are operated off a single cam shaft, and the water circulation is on the thermo-syphon system, rendering the use of a pump unnecessary. The ignition is by Simms-Bosch high-tension magneto, while the mixture is furnished by an automatic carburettor, a feature of which is that the pipe along which the hot air is drawn does not terminate round the exhaust pipe as usual, but round the forward end of the silencer. The transmission is through a leather-faced cone clutch, a three-speed gear-box, and cardan shaft to a live axle. The differential case on the rear axle is provided with an arrangement by means of which it is possible to adjust the mesh of the bevel gear without dismantling any of the parts. Among the Unic cars exhibited was a chassis of the 16-20-h.p. type, which has many points of interest. The four cylinders of the motor are cast in pairs, with the valves on opposite sides; the bore is 87 mm. and the stroke 110 mm. The carburettor is of a simple automatic type, which has proved very economical as regards fuel consumption. The throttle, which is of the sliding piston type, is controlled by both hand and foot levers, the latter being also connected up with the ignition, so that as the throttle is closed the high-tension magneto is retarded. The clutch is of the leather-faced-cone type, and a joint is introduced in the shaft connecting it with the gear-box. The gear is arranged to give three or four speeds as desired, and the control is by a "gate" lever. The transmission is by a cardan shaft to the back axle, which is of solid construction, and fitted with ball-bearings. The exhibit also comprised a 10-12-h.p. two-cylinder landaulet, the chassis being of the same type

Fig. 76.—A Unic 12-14-h.p. Car with Two-Seated Body.

as that employed in the large number of Unic cabs now running in London; and a 12-14-h.p. car, the chassis of which can be provided with any type of body, Fig. 76 illustrating it as a two-seater. The feature of this vehicle is that the engine (75 mm. bore by 110 mm. stroke) has all the four cylinders in one casting, the eight valves being all on one side. In other respects the chassis follows the usual practice in Unic vehicles. Messrs. Mann and Overtons have for some time past been devoting special attention to the demand for landaulets for town and station use at a moderate price, and in the Brasier and Unic vehicles they have a selection which should meet all requirements.

The Metallurgique Cars.

For the coming season four sizes of the Metallurgique cars are being put on the market by Messrs. WARWICK WRIGHT, LTD. They are of respectively 12-14-h.p., 18-h.p., 26-h.p., and 40-h.p. Principal interest centres in the "four-inch" model (26-h.p.), in which a number of important changes have been introduced. While the old type, with cylinders 102 mm. by 120 mm., is being continued, the experience in the Tourist Trophy Race has led to the introduction of a new model in which the piston stroke is 150 mm. Although rated at 26-h.p., this motor is guaranteed to develop 55-h.p. at 1,500 revolutions per minute. The inlet valves, instead of being of the overhead type, are now arranged side by side with the exhaust valves, large water spaces being provided round the valve pockets. The crank shaft is *desaxé*—that is, slightly out of line with the centre of the cylinders. The company were exhibiting a model to demonstrate the advantage this gives in the way of a direct thrust on the explosion stroke. Another new departure is that the pump has been discarded, the water circulation being now on the thermo-syphon system.

The Gregoire Cars.

Among the popular-priced cars of French manufacture, the Gregoire vehicles take a prominent place. The British concession for these vehicles has now been secured by Capt. THEO MASUI, under whose aegis they will doubtless become as popular as the Germain vehicles. Two models are being made for the 1909 season—one fitted with a 9-h.p. two-cylinder, and the other with a 14-16-h.p. four-cylinder engine. As the general design of both cars is identical, the following particulars may be taken as applying to the two models. The engine has the cylinders (80 mm. bore by 110 mm. stroke) cast in pairs, with the valves operated

Fig. 77.—Valve Side of Gregoire 9-h.p. Two-Cylinder Engine.

off a single cam shaft. An illustration of the 9-h.p. motor is given in Fig. 77. Ignition is by Bosch high-tension magneto, while the mixture is furnished by an automatic carburettor, a feature of which is the provision of two jets. As will be seen from Fig. 78, which gives a view of the 14-16-h.p. engine, the carburettor is located on the right of the cylinders, the admission pipe being bolted to one corner of each pair of cylinders, in the walls of which ports or passages are formed leading to the inlet valves on the opposite side. The water circulation is on the thermo-syphon system, no pump being employed. The transmission is through a leather-faced cone clutch and three-speed gear-box, giving a direct drive on the top speed to the rear live axle. It will be seen from Fig. 79 that the cardan shaft is entirely enclosed in a casing, which acts as a torque rod; the forward end of the shaft is supported in a forked arm pivoted to the frame, so that provision for movement in all directions

Fig. 78.—The Gregoire 14-16-h.p. Four-Cylinder Engine, showing method of connecting up the gas admission pipe to the cylinders.

is provided. Other points worthy of attention are the pump lubrication of the engine, a stop in connection with the clutch to facilitate changing gear, and ball-bearings to all parts except the engine. Both vehicles are made in two lengths of chassis, intended respectively to receive two or four seated bodies. The Gregoire cars throughout bear evidence of careful design and construction, and being both speedy and economical, are well worthy the attention of motorists.

The Clyde Cars.

Examples of two, three and four cylinder cars were shown on the stand occupied by Messrs. G. H. WAIT AND CO., of London Road, Leicester, these being of 8-10-h.p. two-seater, 12-14-h.p. four-seater, and 16-20-h.p. five-seater, respectively. These are all fitted with White and Poppe engines and Longuemare carburettors. The motor is mounted transversely on the tubular frame, and power is transmitted by a Renold silent chain drive. The clutch and change-speed gear are close to the back axle and the gears are always in mesh. There is a gate change of T shape with a neutral position in the centre. Two internal expanding side brakes are fitted on the rear wheels, and there is also a pedal brake acting on a steel drum to the countershaft, the latter being geared direct to the back axle. The Clyde cars have done extremely well in competitions since 1903, and with their direct drive on each gear, economical running, and high-class carriage work, they possess points that should secure them the consideration of prospective motorists.

Fig. 79.—Plan of Chassis of Gregoire 9-h.p. Two-Cylinder Car.

The Niclausse Cars.

Messrs. J. AND W. NICLAUSSE, of Paris, who are well known in France as builders of boilers for the Navy, were present with two examples of their petrol cars, which are excellent examples of modern automobile construction. A polished chassis of the 35-h.p. type was shown; the engine comprises four separate cylinders, with the valves arranged on opposite sides. The automatic carburettor is provided with an automatic extra air valve, in conjunction with which is fitted a dashpot arrangement which prevents any sudden movement of the valve. Another point worthy of notice is in connection with the starting handle, which is connected with the exhaust valve cam shaft in such a way that on turning the handle the compression is automatically and partially released. The transmission is through a four-speed gate-controlled gear-box to a live axle of the arched type, universal joints being introduced on the rotating shafts between the differential gear and the rear road wheel hubs. A 20-h.p. limousine-landaulet was also displayed, this, so far as regards the chassis arrangement, being similar to the 35-h.p. type.

The Rapid Cars.

These well-known Italian-built vehicles are now being handled in this country by the RAPID CAR CONCESSIONS, LTD., of Westgate Street, Gloucester. The 14-h.p. car which was on view is provided with a four-cylinder engine, 80 mm. bore by 105 mm. stroke. The inlet valves are located in the cylinder heads and are operated by overhead tappets from the same cam-shaft that actuates the exhaust valves. A special form of adjustment is provided in connection with the tappets. The carburettor is of the automatic type, and is so arranged that when the throttle is entirely closed a port is opened, by means of which only pure air is drawn into the cylinders. The clutch is of the multiple disc type, the discs being flat and alternately of bronze and steel. The gear-box, which is located close to the clutch, is gate-controlled, and gives three speeds with a direct drive on the top to a well-designed back axle; parallel suspension of the latter is obtained by the employment of a torque and two radius rods all working on the same centre as the forward universal joint of the cardan shaft. The 20-h.p. car is, generally speaking, on similar lines; in this case, however, the engine has the valves arranged on opposite sides.

The White Steam Cars.

A fortnight ago we described the new features introduced into the White Steam car, chief of which was the adoption of the Joy valve gear, which gives great opportunity for the simplification of the engine. The latter, which we had seen at the WHITE COMPANY'S DEPÔT, at Carlow Street, Camden Town, London, N.W., was on the stand, and naturally was a centre of attraction. Having already fully illustrated and

referred to the details of the new 15-h.p. and 40-h.p. standard models, it remains but to be said that show exhibits comprised, in addition to the 15-h.p. chassis, a model of that size with a side entrance open touring body, coloured a rich claret, and having a deep back, giving an appearance of luxurious comfort. The 40-h.p. laundaulet shown was also a capital specimen of the coachmaker's art. It will accommodate five passengers inside and two on the front, giving everyone ample room. Painted sage green, with black mouldings and fine yellow lines, it had a distinctive style which should carry it far into Society during the season.

The N.E.C. Cars.

THE NEW ENGINE (MOTOR) COMPANY, LTD., of Acton Hill, W., had a display of their N.E.C. cars, which for originality of design were amongst the most interesting in the Show. Although at first the fact that the mechanism is entirely hidden from view may lead some to think that it is difficult of access, this is far from being the case, the arrangement being, in fact, such that all the different parts of the engine and gear can be got at with a minimum of trouble and without having to get under the car. Two sizes were shown, 30-h.p. and 40-h.p., both being fitted with engines comprising four horizontal opposed cylinders. The motor is located below the front seat floor board; the cylinders are arranged in pairs on the opposite side of the base chamber, the valves being all operated off a single cam shaft. The lubrication is maintained by a pump, while the water circulation is on the thermo-syphon system, the fan being incorporated with the flywheel. A change has been made in the methods of controlling the speed of the engine; this is now effected by a lever projecting beneath the steering wheel at right angles to the steering column, and about which it is free to turn completely round. When right back the throttle is closed, when right forward it is fully open, so that moving the lever forward on either side of the column opens the throttle. The advantage is that the lever can be worked by either hand, and whichever hand is using it the same movement has the same effect. The transmission is through a leather-faced cone clutch, a four-speed gear-box giving a direct drive on the top speed through a cardan shaft and worm gear to a live axle. A point about the N.E.C. cars is that the body is entirely supported between the axles. Special attention has been devoted to the suspension, a new type of spring having been adopted. Fig. 80 gives a view of the front spring; the rear ones differ therefrom only in that the spring box is attached to the frame in a different manner. It will be seen that the inner end of the spring is held in a box bolted on to the frame. The outer end is free to slide in a bracket fixed to the top and able to revolve round the axle. The two bottom leaves of the spring are carried through the bracket. The axle is rigidly attached to the frame by the radius rod, which is immediately beneath the spring and pivoted at its inner end. The advantages of this design are that no end strain can be thrown on the spring; that the radius rod, which is easily removed and straightened, will give sideways under a too severe end strain before the frame can be damaged; that with the radius rod lying immediately

Fig. 80.—The New Type Spring on the N.E.C. Car.

beneath the spring, should one or more of the leaves be broken, the spring can only sag on to the radius rod and the car could be driven in this condition; that the outer end of the spring can be put at the correct height in relation to the centre of gravity of the chassis, and thus obviate the tendency to roll sideways, which is otherwise unavoidable with flexible springs. The complete cars on view included a 30-h.p. "D"-fronted laundaulet, painted green with black mouldings. A special point of this car is that the door is in the centre of the back portion of the body. A 40-h.p. limousine was also displayed, arranged to give complete comfort for five passengers inside, and to carry eight when used for night work, such as theatres, dinners, &c. Finally, mention may be made of a 40-h.p. touring car with a 11 ft. 6 in. wheelbase, and notable for the roomy proportions of the body.

The Swift Cars.

As already mentioned, the Swift Motor Co., Ltd., Coventry, are turning out three different models for the 1909 season, 10-12-h.p. two-cylinder, 15-18-h.p., and 18-24-h.p. four-cylinder. A feature of all these vehicles is the new type of gate-controlled change-speed gear, the lever of which has now a rocking instead of a sliding motion. As will be seen from Fig. 81, the lever swivels on a bearing at the bottom, and is quite separate from the actual sliding rod. The latter is made solid,

Fig. 81.—View of Improved Gate Change on Swift Cars.

with a short ball-ended lever, which is socketed to the hand lever near the lower end, and is thus slid backwards and forwards as the hand lever is rocked freely on its swivel, so that it is impossible for the lever to bind or stick when effecting a change of gear. A safety catch is fitted to prevent an involuntary change from first speed into reverse.

The Opel Cars.

In addition to an Opperman electric landaulet, the BRITISH ELECTROMOBILE COMPANY, LTD., had on view a range of the Opel petrol cars, prominent among which was a 45-60-h.p. chassis; the engine comprises four cylinders cast in pairs, 140 bore by 140 stroke; two systems of ignition are provided, low-tension magneto and high-tension accumulator. The clutch is of the metal-to-metal cone type. The four-speed gear-box gives a direct drive on top to the live axle, the latter being of a strong design, with gate change. A 25-40-h.p. car with Rothschild landaulet body was also shown, this being on similar lines to the 45-60-h.p. Other vehicles to be seen included a 10-18-h.p. touring car with four-cylinder engine, high-tension magneto ignition, and leather-faced cone clutch, and a 10-12-h.p. light model with side entrance body. The engine in this case has the four cylinders, 64 mm. bore by 120 mm. stroke, all in one casting. The Opel cars, which are built at Russelsheim, near Frankfort-on-Main, have been very successful in several important hill-climbing competitions during the past season, notably the Semmering event organised by the Austrian Automobile Club.

The Austin Cars.

The novelty at the stand of the AUSTIN MOTOR COMPANY, LTD., was a new 15-h.p. car, the engine of which has the four cylinders in one casting. Another new feature is seen in the clutch, which is of the leather-faced cone type; instead of the leather being continuous, as usual, it is attached in six segments, each being riveted to a spring steel plate connected with the cone. By means of the new arrangement any of the sections can be taken out, cleaned, dressed, or changed for a new set without dismantling a single nut. The spring sections are also given additional camber, so that the engagement of the clutch is progressive, enabling the engine to take up the load without shock.

The Lanchester Cars.

The principal departure in connection with the cars of the LANCHESTER MOTOR COMPANY, LTD., is the production of a 28-h.p. six-cylinder vehicle with wheel steering. Hitherto these vehicles have been provided with side lever or tiller steering only, but in future clients will be able to make their own selection. As regards the other portion of the chassis, all the well-known Lanchester features, such as the special location of the engine, the epicyclic change-speed gear, and

the worm drive, are being retained. The changes of speed are now effected by a lever working in a "gate." The complete cars on view included a six-seated limousine, a three-quarter landaulet seating six persons, a double phaeton, and a single landaulet. Needless to say, the body work is of the highest class, while the special suspension adopted on the Lanchester cars causes them to be second to none as regards easy riding qualities.

The Iris Cars.

For the 1909 season the Iris cars of Messrs. LEGROS AND KNOWLES, LTD., are being made in two sizes—25-h.p. and 35-h.p. An inspection of the chassis showed quite a number of improvements in these high-grade vehicles. The 25-h.p. engine comprises four cylinders, $4\frac{1}{2}$ in. bore by $5\frac{1}{2}$ in. stroke, the dimensions of the 35-h.p. being 5 in. by $5\frac{1}{2}$ in. So far as the design is concerned, this is identical in both vehicles, so that the following particulars may be taken as applying to each:—The cylinders are cast in pairs, with the valves all set on the same side; the timing gear is now completely cased in an oil-retaining case communicating with the crank chamber. The valve tappet guides for each pair of cylinders are mounted on an aluminium plate secured to the base chamber by six studs. When these are removed the cam shaft is immediately accessible for examination. The lubrication is of the forced type, the oil being collected from the bottom of the sloping crank pit and forced by a pump to the main bearings, and through the hollow crank shaft to the big ends, whence a small pipe up the connecting rods leads the oil to the gudgeon pins. The ignition is by a Bosch high-tension magneto, placed upon the central arm, and driven by an extension of the water circulating pump shaft, so that both pump and magneto are driven in series off one gear. The usual fan behind the radiator is dispensed with, its place being taken by the flywheel, which is provided with radial fan-blade arms. A new feature of the Iris engine is the employment of steel pistons—made under a patent of Mr. Legros—which combines the two qualities of lightness and strength. The throttle and ignition are still controlled by one lever on the steering wheel, but a second small lever is now mounted on the large one by which an extra advance or retard may be given to the ignition relatively to its ordinary position. The clutch is of the multiple disc type, running in oil and connected to the gear-box by a universal joint. The gear-box remains unaltered, and gives three speeds forward with direct drive on top. An alteration to the torque tube has made it now possible to withdraw the whole

Fig. 82.—View of Forward Portion of Chassis of Iris 35-h.p. Car.

propeller shaft, with the driving bevel pinion mounted on it, through the differential casing on the rear axle. The latter is of an exceedingly accessible design, as the whole of the driving bevels and differential can be dismantled without taking the car off its road wheels. The frame of the chassis has been widened to 33 in., thus enabling a larger and wider body to be fitted. The springs are of the semi-elliptical type in front and three-quarter elliptic at the rear. A front axle of H-section forging is now employed, and the road wheels run on Hoffmann compound ball bearings.

The Siddeley Cars.

Although the WOLSELEY TOOL AND MOTOR CAR COMPANY, LTD., have taken no part in any of this year's speed trials and competitions on the road, the high reputation of the Siddeley cars for reliability has steadily increased. The models for 1909 will, as during the past season, be eight in number. Of these only five were to be seen at Olympia, among which is an entirely new type—a light 20-30-h.p. six-

Fig. 83.—Sectional View of Carburettor on Siddeley 14-20-h.p. Car.

cylinder car—which has several improvements suggested by the light of the year's experience. For example, it is fitted with magneto ignition, pump lubrication, and gate-controlled change-speed gear. The 10-h.p. two-cylinder car is being continued, with minor improvements, among which may be mentioned a lengthened wheelbase and mechanical lubrication. The thermo-syphon circulation has been maintained, but the water pipes have been increased in size. On the 14-20-h.p. vehicle a new automatic carburettor has been adopted; a sectional view of this is given in Fig. 83. As will be seen, the float feed chamber and jet chamber are set fairly low down, a pipe of relatively small diameter conveying the gas to the mixing chamber—below the automatic air valve—which also forms the horizontal throttle chamber. The automatic air valve is provided with a dashpot. The foot brake has also been enlarged in diameter, and the wearing surface increased, and the chassis is now supplied with a longer wheelbase so as to permit

Fig. 84.—Sectional Elevation of Siddeley Six-Cylinder Engine.

the use of a light landaulet body. The 18-25-h.p., which may be regarded as the standard car among the Wolseley Company's productions, is again equipped with three speeds, but has now a selector gate change. A more efficient type of radiator is fitted, and the lubrication has been considerably improved. In the 30-h.p. model mechanical lubrication is now employed, while on the 40-h.p. car a multiple disc clutch is fitted instead of one of the metal cone type. In addition to

this a new form of carburettor, which considerably increases the power output and improves the flexibility, is also being supplied. The 50-60-h.p. six-cylinder model is now being built with either chain drive, effected through Renold silent chains, or with a live axle. Principal interest centred in the new 20-30-h.p. six-cylinder car (Fig. 85) above referred to. A sectional view of the motor, which has all the valves operated off a single cam shaft, is given in Fig. 84. The cylinders, which are 3 9-16 in. bore by 4½ in. stroke, are fitted with steel pistons and connecting rods, so as to enable the motor to run at a high rate of speed in order to increase its flexibility. The carburettor is similar in design to that illustrated in Fig. 83; it has, however, an addition in the shape of a choke cap over the jet, which, working in conjunction with the throttle, governs the amount of air allowed to enter the jet chamber, so giving an extra strong mixture for slow running. For higher speeds the carburettor is balanced by means of the extra air valve, which is controlled by a dashpot. As regards the lubrication of the motor, the oil is pumped into troughs below the connecting rods in excess so as to maintain a constant level under all conditions. Scoops on the lower parts of the connecting rods dip into these troughs, and thus lubricate the parts below the piston by splash. The main bearings are independently fed by the pump. The ignition is by magneto, combined with a semi-independent coil ignition for starting and emergency purposes. Both ignitions use the same set of plugs. The radiator is of the honeycomb pattern, and the circulation is by pump, a draught being induced by a fan driven from the engine, immediately behind the radiator, assisted by a fan flywheel. The clutch is of the multiple disc type. Between it and the gear-box are provided two complete universal joints, so as to avoid any possi-

Fig. 85.—Chassis of Siddeley 20-30-h.p. Six-Cylinder Car.

bility of lack of alignment affecting the running of the car. The gear-box provides four speeds, with direct drive on the third. The reverse pinion is stationary on all the forward speeds, and only comes into operation when actually reversing. The "gate" in which the lever works is of a special form. It is very compact, and also so arranged as to prevent any possibility of accidentally engaging the reverse should the press button on the top of the lever be inadvertently depressed. The final drive is by a propeller shaft, fitted with complete universal joints at each end, and bevel gear to the live axle. The hubs run on ball bearings on the axle sleeves, and are driven through a square end from the internal shaft. The complete cars on view included a 14-20-h.p. single landaulet for town use; an 18-h.p. side-entrance double phaeton, with hood and glass screen; a 40-h.p. limousine-landaulet, in yellow, with blue leather; and a 50-h.p. six-cylinder limousine, in royal blue, fitted with canopy and glass screen.

The Albion Cars.

Two models of the latest types of Albion cars were to be seen on the stand of the LACRE MOTOR CAR CO., LTD. These are of respectively 16-h.p. and 24-30-h.p., both being fitted with four-cylinder engines. The main alteration in the 16-h.p. car is the provision of an extra air valve in connection with the carburettor, operated from the dashboard. As regards the 24-30-h.p. model, this is provided with an improved form of carburettor, while the mechanical lubricator has been greatly simplified. The magneto is similar to that fitted on the 16-h.p. engine, except that the magnets are of semi-circular form instead of being straight. In both cars the side driving chains are provided with gear cases, which not only protect the chains from mud and dirt, but act as radius rods.

The Albruna.

Messrs. BROWN BROS., LTD., had on view their familiar cars, which have done good service, notably the 20-22-h.p. Brown that was used by the Royal Commissioners on Congestion in Ireland, a 25-30-h.p., and a 35-40-h.p. four-cylinder vehicle. The new comer on the stand was a two-seated vehicle (Fig. 86), developing 12-h.p., and supplied at a low price. The four cylinders of the engine, 62 mm. bore by 120 mm. stroke, are in one casting. Mechanical valves are fitted. The ignition is of the high-tension Bosch magneto type. Transmission is by a metallic clutch to a three-speed gear with "gate" change. The direct drive is on the third

arranged as to admit the maximum amount when running with the throttle fully open, and in addition there is an air shutter fixed at the opposite end for correcting the mixture in hot and cold weather. An ingenious float agitator, or "tickler," is coupled up by a wire cord to within reach of the driver on the dashboard. The lubrication is effected by means of an oil pump in the crank case which forces the oil through the crank shaft to the bearings, and so up to the gudgeon pins. Instead of filling the oil in the usual side tank, one of the engine arms is provided with a cover into which fresh oil is poured when necessary, this entirely preventing the footboards and steps

Fig. 86.—The "Albruna" 10-12-h.p. Light Car.

speed. The switch is on the top of the steering wheel and a foot accelerator is provided, with auxiliary hand adjustment on the dashboard. The thermo-syphon system of water circulation has been adopted, dispensing with the pump. There are internal rear brakes as well as an internal expanding foot brake on the countershaft. The frame is of pressed steel tapered and well set up at the rear. With its two bucket seats and petrol tank behind, the Albruna presents a striking appearance that should secure its early popularity on the market.

The Ariel Car.

Reference has already been made to the 20-h.p. cars exhibited by the Ariel Motors, Ltd. The company also had on view examples of their 30-h.p. and 40-h.p. cars, which embody many points of interest.

Fig. 87.—The Ariel 40-h.p. Four-Cylinder Engine.

Fig. 87 illustrates the carburettor side of the 40-h.p. engine, which, like the 30-h.p., has the cylinders cast in two pairs, with the inlet valves located in the cylinder heads, and operated by overhead tappets off the single cam shaft. The carburettor is of a simple automatic type; it has a single jet, which is attached to the base casting of the float chamber, and can easily be dismantled without having to remove the whole of the carburettor. The throttle is of the piston type, working in an extended cylinder on the forward end of the vaporising chamber, and can be operated either by hand or foot. The air ports are so

becoming covered with oil. A striking car on the Ariel stand was a 50-h.p. with Pullman body by Rippon Bros., Huddersfield. The vehicle (Fig. 88) has been built to a special design in order that the driver shall be completely enclosed, and in the case of fine weather it is possible also to have the car completely open. Another feature is that the rear portion, which is after the design of a single landaulet, can remain closed whilst the front seats are left open, and the dash-board glass screen can be folded, as is usual with a touring car. The internal fittings are most complete, and include tables, electric lights, speaking tubes and speedometer. There is seating capacity for five people, and the colour scheme is effectively carried out in dark sage green with black moulding and fine red lines. The upholstery is in red leather, and the roof is covered in cloth to match.

Fig. 88.—The Ariel 50-h.p. Car, with special Pullman Body.

Chenard-Walcker.

Messrs. CHENARD AND WALCKER (England), LTD., had on view their 8-9-h.p. single-cylinder chassis, another, mounted with a two-seated body, chassis of the two-cylinder 10-h.p., and four-cylinder 10-12-h.p., and a 14-16-h.p. four-cylinder landaulet of stylish appearance. Several good points are incorporated in these vehicles. The 8-9-h.p. chassis has a single cylinder with a bore of 100 mm. and a stroke of 120 mm. The ignition is of the high-tension Bosch magneto type. Power is transmitted to the road wheels by the employment of a double axle, in which the weight of the car is borne on a solid fixed axle independent of the driving axle.

SOME ACCESSORY EXHIBITS.

Machine Tools.

Messrs. DRUMMOND BROS., of Ryde's Hill, Guildford, who are well known in the motor industry, their special tools for workshop garages and workshops being in most of the representative establishments in the country, had an utilitarian exhibit of considerable interest. Speaking of the whole range of the firm's productions, they are notable for the sound workmanship that enters into their construction, strength and firmness being indicated in their appearance. A new radial drilling machine, available for foot drive as well as operation by power, was shown, this being one of the first of the kind produced by Messrs. Drummond Bros., at a price which should secure its extensive adoption throughout the country. Its range of work is from 1-16 in. to 1 in. The 3½ in. screw cutting lathe was on view, and a general selection of tools for motor repair shops. A new tool recently brought out by Messrs. Drummond Bros. is an excellent hand-lever bench shaping machine, with the cutting keyway in the shaft passing through the body of the device. This is practically a reduced copy of a power shaping machine worked, however, by a hand lever in place of crank and belt pulleys.

C.A.V. Specialities.

A large display of their well-known electrical specialities was made by Messrs. C. A. VANDERVELL AND Co., of Warple Way, Acton Vale, London, W., who have secured the confidence of practical motorists to a great degree. A special exhibit of interest was the Ruthardt high tension magneto, in which the magnetos are nearly circular instead of

Fig. 89.

Fig. 90.

the usual horseshoe pattern. The good features of these have already been described. The C.A.V. distributor coil, Model A4, of the dashboard type, is shown in Fig. 89. Among the other exhibits were portable hand lamps (Fig. 90), suitable for garages and similar establishments. These are made with detachable celluloid accumulators, and will be found an improvement on the older types, as the battery can be removed for recharging when necessary.

Continental Tyres.

A new all-rubber non-skid with a three-ribbed tread was the novelty at the stand of the CONTINENTAL TYRE AND RUBBER COMPANY, LTD., while an "extra strong type course" inner tube was being shown for the first time. The latter is of a distinctive green colour, and is specially adapted for use with the tread with three wide circumferential ridges and deep grooves. The tyre has been thoroughly tested, and should become a standard Continental article.

The Doherty Carburettor.

Among the exhibits of the DOHERTY MOTOR COMPONENTS, LTD., was the Tubicomb radiator, illustrated in our issue of the 14th inst. They also showed their new automatic carburettor, and although it has not appeared at an exhibition before it has been thoroughly well tested on the road during the past few months. In this new carburettor the variable jet is of tubular form, carrying a larger plunger, which is raised and lowered as the throttle is opened by means of a small eccentric on the throttle spindle. The supply of petrol increases with the air supply, both being controlled by one lever. The adjustment of the

device to suit any engine is made by releasing a small set screw and moving a graduated collar, the whole operation occupying but a few seconds. Compactness and lightness, as well as efficiency, are characteristic of the Doherty carburettor.

Van Raden's Specialities.

Messrs. VAN RADEN AND Co., LTD., have long been known to motorists in connection with specialities for ignition, and their display served to emphasise the position they have attained in this connection. Their patent spun-glass and woven-glass accumulators are now, owing to the reduction in the cost of the raw materials, lower in price than before, while their "L" type of spun-glass plates continues to supply a large demand where hard wear and tear is required of the motor vehicle. Moreover, the amalgamation of the frame, grid and paste, and the porosity caused by the internal use of spun glass render the plate extremely active and of great capacity. This year a new celluloid battery was shown, in which the cell is unspillable, while there is no interference with the free escape of the generated gases to the open air. In this type the plates are supported at the top and bottom, so that they do not come in contact with the sides or ends of the celluloid boxes. At the same time the electrolyte has free circulation all round the plates. Below the vent hole in the top of the cell is a trough with glass wool, preventing the possibility of the acid being spilt, and also serving to keep the plates in position. The vent plug is dispensed with altogether, and the new pattern should quickly become popular. Hand lamps for the garage and roof lights for the tops of covered bodies were exhibited, and we noticed some improvements have been made in the Van Raden induction coils, without and change in the prices originally charged. The present method of ensuring the insulation of the bobbin and connections should secure the utmost durability. Several patterns of sparking plugs were also on view. Reference to this stand would be incomplete without mention of the Newport dual ignition introduced by the firm. In this high-tension magneto the pole pieces are cast in the armature tunnel, there are unpierced magnets, and the circular condenser is mounted on the armature spindle. It has an external safety gap.

Timber for Bodies.

Messrs. JOSEPH OWEN AND SON, LTD., had a representative collection of timber for motor-car body builders, this being shown in planks and boards as well as in panels. The firm occupy a leading position in the timber trade of Liverpool, and from their yards in the Borough High Street, London, S.E., are supplying many of the leading builders of automobile carriages. Oak, ash, birch, mahogany, and other hard woods were shown, as well as some well-shaped panels in white wood and yellow pine. Bent timber was another section of the exhibit, which also comprised wings, seats, sticks, rails, &c., hickory rims, ash felloes, hickory spokes, &c. In addition to the woods for bodies, Messrs. Owen and Sons, Ltd., showed their watchfulness of the requirements of the motor trade by displaying a number of remarkably good mouldings for wind screens.

Hutchinson Tyres.

ETABLISSEMENT HUTCHINSON, of 13, Maddox Street, Regent Street, London, W., had a good position whereon to show their Hutchinson tyres for voiturettes and larger cars. These are supplied with the wood fibre non-skid, the steel-studded non-skid, and a grooved tread, so that there is a good choice in connection with this tyre, which has certainly done good service. It is claimed in connection with the wood fibre non-skid that the durability is ensured by the particular plan of construction adopted. The steel studs are held by hardened compressed plaques of wood fibre protecting the running surface, and consequently increasing the life of the tyre. The other tyres on the stand were distinguished by the thick tread reinforced by extra layers of canvas at the beads.

The Parsons Non-Skid.

Since their original introduction the Parsons non-skids, for which the PARSONS NON-SKID COMPANY, LTD., of 210, Shaftesbury Avenue, London, W.C., is responsible, have been constantly improved, until they now present one of the most valuable devices of the kind on the market. The Parsons Grippa non-skid is made with an endless chain side hoop, and another which is divided in two places and fastened with couplings. As the non-skids slacken with wear, they can be easily tightened by taking off a link from the outer hoop chain. This can be attached in three minutes, and detached in one-third of the time. At the stand we also saw the Parsons sparklet inflators, which are now made up in small cases that can be easily packed away on the car, such a size having the capacity of pumping ten 870 by 90 tyres. The idea of the Sparklet

inflator has been adopted for use as a fire-extinguisher, the interior of the vessel being filled with water, which, on being discharged, is impregnated with carbonic acid gas. Reference may also be made to a change introduced into the well-known Parsons detachable rim with a view to secure its effective adjustment.

Vasoleum.

At the stand of the NEW MOTOR AND GENERAL RUBBER COMPANY an interesting exhibit was made of Vasoleum. This is being put on the market by the County Chemical Company, Ltd., of Birmingham, who will be pleased to give practical demonstrations of its merits in any locality where agents and motorists are likely to give the preparation effective trial. It is claimed to have "all the lubricating virtues of both oil and grease, with none of their vices." At the Show a demonstration was given showing how Vasoleum passes freely in and around the gears, never escaping or solidifying, and ensuring cool, silent running. Eliminating friction, the preparation should assist the longevity of the gears and add its quota to the easy running of the car. The Warwick motor tyres and the Rub Metal non-skids were also staged on the same stand.

E.I.C. Specialities.

The large selection of their specialities shown by the ELECTRIC IGNITION COMPANY, LTD., of Sparkbrook, Birmingham, comprised something of interest for every visitor. Even those who did not comprehend the significance of the many improvements offered were well able to recognise the sound construction and excellent finish of the articles on the stand. The E.I.C. magneto is characterised by the reduction of the number of parts—a development that has given the makers confidence in guaranteeing their magneto for two years. In connection with this, mention may be made of the dual ignition attachment, which can be easily fitted to any E.I.C. magneto, and gives the advantage of being capable of being used either as an ordinary trembler coil distributor ignition, or as a non-trembler coil distributor ignition by the simple operation of moving a small lever from right to left, or vice versa. The difficulty which is often experienced of starting up with a non-trembler coil ignition in winter time is obviated, for by the movement of the lever the coil can be made to work as a trembler coil. If the engine is turned, if only very slowly, 70 or 80 sparks will jump across each sparking plug point in due course, so that starting up becomes quite easy and the engine will start off the switch, provided, of course, that everything is properly adjusted. Another good feature of the dual attachment of the E.I.C. type is that the main switch-handle is detachable, preventing the starting of the engine by unauthorised persons. In plugs, the company showed their A1 Mica Model. The insulator of this can be taken out of the body of the plug in half a minute, wiped, and replaced without any disturbance of the electrical connections which remain in the cylinder. High-tension distributors, accumulators, &c., completed a very representative exhibit.

Repair Work.

Unique among exhibitors by reason of its being the sole representative of motor repairing work on show, the LAYSTALL MOTOR ENGINEERING WORKS, LTD., 27-29, Laystall Street, Rosebery Avenue, London, E.C., attracted considerable notice. It specialises in such work as the production of special castings for replacements, the repair of cracked or broken cylinders, and similar work, which means economy to the motorist who has had mishaps which would otherwise consign much material to the scrap-heap. The samples of repair work on view included gears, cylinders, &c., specimens of the latter shown including those in which the cylinders had been rebored for the purpose of renewing compression to cylinders which are worn or scored. The company have executed more than 2,000 orders for repair work this year, and their plant and staff have both satisfied their clients. They are able to undertake complete overhauling and repairing, and have done a good deal of work in lengthening chassis and fitting side-entrance bodies.

Dunlop Motor Clothing.

The name of the firm and its acknowledged reputation contributed to the maintenance of a crowded condition for the space in the gallery whereon the DUNLOP RUBBER COMPANY, LTD., of the Manor Mills, Birmingham, had a display the variety of which deserved a better opportunity of exhibition. Several excellent styles of motor coats for ladies and gentlemen were on view, the specialities—all rubber-proofed—being the "Crossover," the "Militaire" and the "Renault." The detachable leather and camel fleece linings which came into vogue a couple of seasons ago continue their popularity, the comfort and adaptability of the patterns being likely to sustain their present favour for a long series of years. These linings are successfully introduced in

English tweeds, Irish friezes, and rainproof materials. A large selection of rubber goods, aprons, car covers, lamp covers, and similar accessories was also included in the exhibit of the Dunlop Rubber Company, Ltd.

The Peter Union Tyre.

In addition to their well-known flat and round treaded tyres, the PETER UNION TYRE COMPANY, of 6, Upper St. Martin's Lane, London, W.C., had on view a ribbed tyre. In this the tread is flat, with three ribs so pronounced that in wet and greasy weather they act as an efficient non-skid. A special point is made of the quality of the tyre. In the tread a tough rubber is employed with the view of securing the retention of the form on the ribs as long as possible. The canvas used, too, is of a selected and carefully-tested quality. Both the bead and the tread are strongly made, and the makers claim that it is impossible for any of these parts to burst or break, while the system of testing adopted with every tyre enables the company to assure buyers of the good wearing quality of the Peter Union tyre.

Benetfink's Accessories.

Since it came into the hands of the present proprietors, the old-established firm of Messrs. BENETFINK AND Co., LTD., of 107 and 108, Cheapside, London, E.C., has completely established itself with motorists in the City of London as an emporium for their requirements. Evidence of the universal character of the stock kept in Cheapside was given at Olympia, where the representation included motor tools, horns, speedometers, electrical accessories, clothing, gloves, goggles, and, in fact, many of the things that the motorist really needs.

The "No Glare" Lamp.

In our last issue a description was given of the "No Glare" lamp,

Fig. 91.

brought out by Messrs. BLERIOT, LTD. In Fig. 91 we give an illustration of the device, which effects the purpose of minimising the glare from the headlights of motor cars without any mechanically-operated screens or shutters. The lamp is of good appearance and is supplied either of all brass or nickel plated. Now that the winter is upon us and lights are required before 5 p.m., the motorist who indulges in evening motoring will be wise in giving heed to the excellent features of the

Bleriot lamps. The headquarters of the agency in London are at 53, 54, Long Acre, W.C.

"Enots" Triple-Action Pump.

Messrs. BENTON AND STONE, of Bracebridge Street, Birmingham, had a valuable collection of accessories and devices calculated to ease the labour of motorists on the road. Motor-tyre pumps, petrol filters, lubricators, &c., made up a display which contained several features to some of which we hope to refer on a later occasion. Among them was the "Enots" compound triple-action pump, which is supplied with a pressure gauge calibrated to 100 lb. per square inch, secured by a swivel nut which prevents it jarring loose. In this all the inflating is done on the downstroke, the upstroke being made use of to compress the air into the smaller barrel from the larger one. The makers emphasize the fact that there are no glands or stuffing brass to wear away or get out of order.

Radiators.

On every occasion that productions of Messrs. ORME, EVANS AND Co., LTD., of Wolverhampton, have been represented at a London show we have been impressed with their style, construction, and finish. They comprise bonnets, tanks, radiators, and similar components, the latter department including those of the gilled tubular variety, and also two specialities, known as the Orme-Whitlock and the Livingston. The latter has few parts, little weight, and great efficiency, while its economy of cost is another of its quartette of merits. It is constructed of bands which are composed of light copper strips joined together, forming a square section tube, which is automatically produced with mathematical accuracy. This radiator

gives 58 square inches of cooling surface to one square inch of radiator front. In the Orme-Whitlock radiator the feature is the series of transversely corrugated tubes which extend between a top and bottom water tank. The corrugations of each tube are reversed with relation to the two tubes adjacent on either side, so that air cells run from the front to the back. Copper is employed in the cellular portion, the tanks and case being made of polished brass, and presenting a wholly creditable appearance. Only one width, 4 in., is made of the Livingston radiator; that of the Orme-Whitlock is made in the following widths: 3 in., $3\frac{1}{2}$ in., 4 in., and 5 in.

Goodrich Tyres.

The special distinguishing feature of the Goodrich non-skid, which was shown by the B. F. GOODRICH COMPANY, of 7, Snow Hill, London, E.C., is the rubber studs, which take the place of the ordinary metal studded tyre in this particular make. Being moulded in the tread, they are not likely to come away, while their non-slipping properties are easily demonstrable. The Goodrich non-skid can be fitted to other makes of tyres than the Goodrich.

The Dunlop Rim.

In addition to the Dunlop tyres, which have already been referred to, the DUNLOP TYRE COMPANY had on view a new detachable rim, which was shown for the first time. In the device the expanding flange ring is the essential feature. This is attached to the outer side of the wooden wheel by bolts, which are secured by nuts on the inner side of the wheel. There are eight of these bolts inserted at equal distances in the wheel. As will be seen from Figs. 92 and 93, an expanding and

Figs. 92 and 93.

contracting device is provided, so that the bolts and nuts do not require to be disturbed. The illustrations show the front and back views of the flange ring half contracted. The expansion and contraction is effected by an eccentric movement of the joint, actuated by a lever attached to the hole in the locking plate, on a system somewhat similar to that employed in the original type of Dunlop detachable rim. The new rim is certainly a great advance in such devices.

Motor Supply Company.

The MOTOR SUPPLY COMPANY, of 110-111, Piccadilly, London, had a comprehensive display of specialities for which they are agents. The Torkington tyre, a solid rubber tyre possessing many good qualities, which were fully explained in our columns recently, was on the stand, as well as many minor accessories equally necessary for the steady running of the car. Among these was the well-known Eyquem sparking plug, several good patterns of lamps and fittings for the same, horns, including those of the boa constrictor type, tool kits, goggles, &c., the latter being fitted with lenses to suit various sights.

Windham Interchangeable Bodies.

On a 20-h.p. four-cylinder Beeston-Humber, the WINDHAM SLIDING DETACHABLE MOTOR BODY COMPANY, of 22A, St. John's Hill, Clapham Junction, London, S.W., demonstrated the undoubted advantages of the system of patent detachable and interchangeable motor bodies with which their name is associated. The plan has had considerable endorsement from those who have adopted it since the publication of the description which appeared in our columns. The Earl of Norbury declares the method of attachment, though simple in the extreme, to be perfectly secure, without rattle or clatter. It

is, he adds, only a matter of seconds to take off the body, and it is a great advantage to have legs on which to stand it or wheel it about. Mr. Frank Warrack, of Carnwath, N.B., has adopted it on a Berliet chassis, which he is able to use three days a week as a shooting brake, and on the alternate days as a side-entrance car of the ordinary type. With only a little practice, the rear portion of the box can be taken off and another portion placed in position, joining up in a style that avoids notice and secures safety in less time than detachable rims can be dealt with.

Miscellaneous.

The SAMSON LEATHER TREAD AND TYRE COMPANY, LTD., 1, New Burlington Street, Regent Street, W., were represented by the "Royal" Samson de Luxe tyre, which is claimed to secure efficiency with regard to non-skidding properties without adding to the weight. Grooves are made across the tyre running parallel to each other at an angle of about 45 degrees to the direction of running. In each of these is set four metal studs, the tops of which are flush with the cover of the tyre. The tyres are supplied in pairs (right and left), so that when they are running on the road there is a greater tendency to grip the road and reduce the likelihood of skidding to a minimum. Inner tubes, plain covers, steel studded covers, and grooved covers made up an interesting exhibit.

The "Marston-Megenet" honeycomb radiators were the feature of the display of Messrs. JOHN MARSTON, LTD., of Wolverhampton, whose bonnets, wings, panels, &c., were also to be seen on many leading cars in the show. A pressure feed petrol tank was also included in the exhibit.

Several useful tools were on the stand of Messrs. F. M. RUSSELL AND CO., LTD., of Willesden, N.W., these including the "Newleva" and "Gryp" patent spanners and pipe wrenches, as well as the "Calori-Bloc" warmers, the latter being serviceable in such cold weather as now seems to be coming upon us.

The "Ubas" steel, with which Messrs. W. T. FLATHER, LTD., of Sheffield, are associated, was shown in the Gallery. This is now coming well into service for gears, shafts, bearings, and the like. Test pieces of nickel steel and a good display of metals for the automobile industry made up an interesting exhibit.

THE CAR AND GENERAL INSURANCE CORPORATION, LTD., 1, Queen Victoria Street, London, E.C., took advantage of the occasion to make the advantages they offer better known. They undertake the insurance of mechanical breakdowns, accidental damage, third-party claims, &c.

At the stand of Messrs. MÖBIUS AND SON, of 1, Howard Road, Stoke Newington, were to be found the well-known "Challenge" motor oils, and the grease with the same distinctive name. Oils for every description of motor work were included in the display.

Several good types of accessories and competent parts were to be seen on the stand of Messrs. B. M. and W. D. FAIR AND CO., their specialities including the "Percival" self-locking control levers, the Noakes' lubricator, the A.P.S. shock absorber, the "Gibaud" radiator, and also those of the "Grenier and Mercier" type.

The exhibits of Messrs. DOVER, LTD., of most interest to motorists were the different types of the "Dover" motor steering wheels. These are made with brass, gunmetal, and aluminium centres, and are fitted with rolled steel rim and polished Exonite covering with the well-known ribbed grip. The company also showed a steering wheel which is entirely covered with polished Exonite, and they had a small selection of their patent sleeve nuts for security bolts and valves for the quick detachment of tyres.

An all-rubber non-skid tyre was shown on the stand of the COLLIER TYRE COMPANY, LTD. The tread is moulded so as to secure a surface in which a number of diamond-shaped intersections appear. This "Medallion" beaded edge tyre presents a roughened tread to the ground, which should prove little liable to side slip.

"D.W.F." patent standard ball-bearings were exhibited by Messrs. LUDW. LOEWE AND CO., LTD., who are the sole agents. The journal bearing shown on the stand was unique in the fact that it has unbroken races, while the balls themselves are contained in a one-piece metal cage. Messrs. Ludw. Loewe and Co. were also showing a number of steel plates in which the "D.W.F." steel balls have been impressed by blows from a steam hammer. The result was a capital demonstration of the remarkable hardness and tenacity of these specialities.

A useful display was that of Messrs. W. H. WILLCOX AND CO., LTD., of Southwark Street, London, S.E., which included oils, greases, &c., for cylinders, gears, bearings, &c. Lubricators of various types were shown, as well as a selection of tools and accessories for garage proprietors.

(To be concluded.)

THE STANLEY SHOW.

THE thirty-second annual Stanley Cycle Show, which opened at the Agricultural Hall, Islington, on the 20th inst., and which closes to-day (Saturday), has apparently lost none of its interest, the well-known locale being well filled. A feature of the exhibition is the large number of motor-cycles on view, and judging from the interest taken in the machines, the pastime of motor-cycling, far from declining, as has been frequently prognosticated, seems, to use a popular phrase, to be going stronger than ever. One striking evidence of this is seen in the fact that the Humber Company, who a few years ago gave up their motor-cycle department, have again taken up the construction of motor-bicycles. The new Humber machine is fitted with a $3\frac{1}{2}$ -h.p. engine, the crank shaft of which runs on ball-bearings, and among the special features are a new design of frame, the silencer being so arranged that it forms part of the main down tube. It has been made unusually large, having a capacity of ten times that of the combustion chamber, and is made of steel tubing. The transmission is by a V-belt and two-speed gear.

The REX MOTOR MANUFACTURING CO., LTD., are building two sizes of the Rex motor-bicycle— $3\frac{1}{2}$ -h.p. single-cylinder, and 5-h.p. twin-cylinder. Among the features of these machines are a new type of spring fork which is so designed that the front wheel can easily be detached without deranging the fork in any way. The engine is now carried in a new type of steel cradle, with which is incorporated the magneto cradle, the magneto being placed very high from the ground so as to be free from mud splashing. The tank is of an entirely new design and holds $1\frac{1}{2}$ gallons of petrol; a lubricating pump is placed inside the tank. The engine has been altered considerably, the exhaust ports having been arranged to enable a free exit of the burnt gases. The timing gear is now so arranged that one cam working two rocking arms manipulates the valve tappets.

One of the most novel motor-bicycles to be seen is that shown by the JAMES CYCLE CO., LTD., Birmingham. The frame is quite a radical departure from the usual pattern, it being so arranged as to give the rider an extremely low position and enabling either of the wheels to be readily detached. The engine, which is of $3\frac{1}{2}$ -h.p., is fitted with a patent system of concentric valves and magneto ignition.

Other motor-bicycles on view include those of the WEARWELL MOTOR CARRIAGE CO., LTD., Wolverhampton, Messrs. DOUGLAS BROS., Kingswood, Bristol, the Motosacoche of Messrs. DUFAUX AND COMPANY, the LLOYD MOTOR AND ENGINEERING COMPANY, Birmingham, OSBORNE MOTOR MANUFACTURING COMPANY, Lincoln, "E. D. F." MOTORS, Birmingham, Messrs. BRADBURY AND CO., LTD., Oldham, J. PRINGLE, Saltcoats, N.B., Messrs. J. T. BROWN AND SONS, Reading, NORTON MANUFACTURING COMPANY, Birmingham, BAT MOTOR MANUFACTURING COMPANY, Penge, S.E., the OAKLEIGH MOTOR COMPANY, West Dulwich, the MOTOR REVE COMPANY, the QUADRANT MOTOR CO., LTD., Coventry, the PHANOMEN MOTOR COMPANY, MINERVA MOTORS, LTD., the PHELON AND MOORE COMPANY, the SERVICE CO., LTD., the TRIUMPH CYCLE CO., LTD., ZENITH MOTORS, LTD., the VINDEC MOTOR CYCLE CO., LTD., H. COLLIER AND SONS, LTD., Plumstead, the F.N. MOTOR AGENCY, Messrs. BROWN BROS., LTD., Messrs. CHATER-LEA, LTD., the N.S.U. MOTOR CO., LTD., the ARNO MOTOR CO., LTD., and L. W. WALL, LTD., Birmingham.

The Gilbey Hall is, as usual, devoted to motor-car exhibits, and although the number is not very large, the vehicles on view are well worthy of inspection, especially as illustrating recent developments in light cars fitted with air-cooled engines.

The Starling and Little Briton Cars.

The most interesting display of cars is that of the STAR CYCLE CO., LTD., Wolverhampton, who have for some years been devoting special attention to the production of reliable little vehicles to meet the demand of a large and steadily increasing class of motorists. One of the most attractive machines is the Little Briton 10-h.p. machine, built on the lines of a racer, this being achieved by locating the two seats well to the rear and employing a long engine bonnet. The motive power is supplied by a 10-h.p. two-cylinder engine, $3\frac{1}{2}$ in. bore by $4\frac{1}{4}$ in. stroke. The standard ignition is by coil and accumulators, but provision is made for the ready installation of a high tension magneto. The speed of the motor is controlled by varying the lift of the inlet valves. The drive is through a leather-faced cone clutch, three-speed gear-box, mounted on Hoffman ball-bearings, cardan shaft, and bevel gear, to a substantially-designed live axle. So far as the chassis is concerned the Royal Starling cars are on very similar lines to the Little Briton; the bodies—two or four seated—being, however, of the touring vehicle type. Finally, reference may be made to the Imperial

Starling two-seated car. This is fitted with a single-cylinder engine, $4\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke, rated at 8-h.p. The details throughout are on up-to-date lines, as may be judged from the fact that the gear-box is not only mounted on ball-bearings, but is provided with a lever working in a "gate."

The O.T.A.V. Voiturettes.

Several examples of the interesting little O.T.A.V. voiturettes are to be seen at the stand of the JUNIOR AND O.T.A.V. CARS CO., LTD. These have already been illustrated and described in the *M.C.J.*, but it may be mentioned that they are fitted with a $5\frac{1}{2}$ -h.p. single-cylinder air-cooled engine, 100 mm. bore by 110 mm. stroke, located in the fore part of the frame. A chain connects the engine with the countershaft, on which is mounted an epicyclic two-speed gear; the final drive is by V-belts from the ends of the countershaft to pulleys on the rear road wheels. The O.T.A.V. voiturettes have been submitted to exhaustive trials, through which they have passed successfully. Fitted with a hood they form a handy little runabout machine.

The Piccolo Cars.

Two very interesting types of cars, fitted with air-cooled engines, are shown by the VICTORIA TRADING COMPANY, of 47, Lamb's Conduit Street, London, W.C. The vehicles, which are of German construction, and known as the Piccolo, follow in general design the usual lines of cardan shaft driven machines. Dealing first with the two-seated vehicle, this is fitted with a 6-8-h.p. V type twin-cylinder engine, the

View of Front Portion of Daimler 57-h.p. Six-Cylinder Car.
(See page 819 last issue.)

cooling of which is effected by radiating fins in conjunction with a couple of fans driven by a belt off the crank shaft. The cylinders themselves are made from a special quality of steel, which is claimed to be non-heat retaining. The three-speed gear-box, which is controlled by a lever under the steering wheel, is built up so as to form a unit with the motor. The final drive is by a cardan shaft with joints at each end, and bevel gear to a live axle. The 12-16-h.p. car, which is fitted with a standard side-entrance double phaeton body, is on similar lines to the 6-8-h.p.; the engine, however, comprises four cylinders, 72 mm. bore by 95 mm. stroke, three fans being provided to assist in the cooling of the cylinders.

The Chater-Lea Carrette.

A somewhat novel design of two-seated car is exhibited by CHATER LEA, LTD.; it is known as the Chater-Lea Carrette, the novelty lying in the fact that the engine—a 6-h.p. V-type two cylinder—is mounted on the outside of the frame at the right of the driver. The transmission is through a leather-faced cone clutch to a compact three-speed gear; the driving shaft is arranged as a continuation of the engine shaft, and is carried across the machine; it terminates in a sprocket from whence the drive is by Renold chain to the left rear road wheel. The vehicle is claimed to be able to maintain an average speed on fair roads of 20 miles per hour.

The Vindec Voiturette.

The VINDEC MOTOR CYCLE COMPANY, 13-15, Wilson Street, Finsbury, introduce a new two-seated voiturette fitted with a 7-9-h.p. V-type two-cylinder air-cooled engine. The transmission is by a chain to a countershaft, on which a clutch and two-speed gear is mounted, the

final drive being by a single V-belt to a pulley bolted to the near side rear road wheel. The fitting of a differential gear is obviated by mounting the off-side wheel so that it runs loosely on the continuous axle.

The Arno Car.

A new-comer in the motor-car world is the ARNO MOTOR CO., LTD., Coventry, who are showing a 35-h.p. car fitted with a White and Poppe four-cylinder engine, automatic carburettor and two systems of ignition. The transmission is through a leather-faced cone clutch, three-speed gear-box, cardan shaft and bevel gear to a live axle. Among the special features in the Arno car is the method of attaching the springs to the frame, and the provision of a large detachable cover to the differential case, by means of which the large bevel and differential gear can not only be readily inspected, but, if necessary, removed with but little difficulty.

The Phenomen Car.

A novel three-wheel two-seated car is shown by PHANOMEN MOTORS, of 49, King Square, Goswell Road, E.C.; the novelty lies in mounting the engine—a 6-8-h.p. V-type two-cylinder—and the whole of the driving gear on the single front wheel.

Some Accessories.

The CITY IGNITION COMPANY, of 14, Spencer Street, Goswell Road, London, E.C., are in the Arcade with their "Voltoo" coils, sparking plugs, and similar specialities. The Voltoo 2-volt coils are claimed to have a minimum of current consumption, and require but slight adjustment, renewal of platinum points, &c., thereby entitling them to be regarded as an economical type.

Messrs. W. AND R. JACOBS, of 39c, King William Street, London, E.C., have a large selection of electrical accessories for motor-cycles, their standard goods including a full range of accumulators from 2 to 8 volts, sparking plugs, voltmeters, &c. The "Electary" electric side lamps for tricar and cars are a large feature of the display, the details of which are of good construction, as well as of sound principles and design. The new Aimia plug, in which the electrode is one solid piece of pure nickel steel, practically insensible to expansion, is shown by the ABOLO COMPANY, 133, Regent Street, W.

At the stand of the INDIA RUBBER AND GUTTA PERCHA CO., LTD., is the sectional type for motor-buses, invented by Mr. A. T. Collier and placed upon the market by the Reilloc Tyre Co., Ltd., of 83, Victoria Street, Westminster, S.W. This was fitted to the Renard trains running at the Franco-British Exhibition. It consists of a series of sectional blocks of rubber, any of which can be replaced when worn, and offers a useful innovation to those concerned with heavy traffic.

Messrs. STEINER AND COMPANY, now located at 58, Great Eastern Street, London, E.C., have a good range of their lamps and horns for motorists. Of the latter the firm have a full range of 15 patterns and 120 sizes, including some excellent types, to which we hope to refer on a later occasion. The "Hella" lamp, with its automatic generator, is notable in the lamp section, where is also included the Phare Ellipso searchlight, with mirror lens, reflector and sectional front glasses.

Messrs. PRICE'S PATENT CANDLE CO., LTD., have a large display of their specialities, which include Rangraphine for motor chains, Belmoline solidified oil, and other productions that have stood the test of time with motorists.

The COUNTY CHEMICAL CO., LTD., are taking advantage of the occasion to make their "Vasoleum" for gear and differential lubricant better known, and their range of Chemico specialities and vulcanising equipments is also on view. At another stand the UNION RUBBER AND CHEMICAL CO., LTD., is drawing attention to an electric vulcaniser and the Turco detachable lining, which is intended to give a new foundation for a tyre, and, in cases of emergency, can be fitted to the cover in a few seconds. Elsewhere in the Gallery will be found the exhibit of the ELEPHANT CHEMICAL COMPANY, which includes "Calcoid" for motor lamps, and the well-known Elephant motor greases.

Messrs. MOEBIUS AND SON have a large display of oils, special attention being drawn to their "Challenge" motor oils and greases.

Messrs. HARVEY, FROST AND CO., LTD., are showing their "Popular" type of vulcaniser, and generally proving the capacity of their appliances to execute excellent repairs to punctured tyres.

In a prominent position in the Arcade Messrs. W. SEARLE AND COMPANY have on view their well-known speedometers, and also the A.V. sparking plugs and Fulmen accumulators, for which they are agents in this country.

Other well-known exhibitors include Messrs. NICKELLS AND CO., of Blackheath, who show their patent terminals with auxiliary connections; and among other prominent exhibitors are the ARA MATERIAL PATENTS MANUFACTURING CORPORATION, with their familiar means of

vulcanising tyres. With this system surface cuts on covers can be repaired without deflating the tyre; Messrs. E. H. HILL, LTD., of Sheffield, whose motor tyre pumps and tool kits deserve mention; Messrs. J. B. BROOKS, LTD., who show a complete motor-cycle touring equipment; the PETER UNION TYRE COMPANY, with puncture-proof bands; the BIFURCATED AND TUBULAR RIVET CO., LTD., with the speciality indicated in the title of the firm; ETABLISSEMENTS HUTCHINSON, whose motor-cycle tyres are on view; the PRESTED MINERS' GAS INDICATING ELECTRIC LAMP COMPANY, with batteries, coils, charging boards, &c.; and Mr. H. J. HARDING, whose "Pushon" pump connection enables an airtight joint to be made on the valve of a tyre instantaneously. Mr. Harding also has an accumulator with detachable plates which can be replaced when run down. LYXAVON, which is well known to motorists as an effective liquid soap, possessing really wonderful activity as a cleanser, is brought to the front again by the company of that name.

Mr. R. W. COAN has his familiar place at the entrance to the Arcade, where he demonstrates his capacity to repair broken crank cases and undertake all classes of aluminium work at his establishment, 219, Goswell Road, Clerkenwell Road, London, E.C. A new exhibit is an aluminium mould for making rubber matting.

The Palmer, Calmon, Le Persan, Continental, and other well-known tyres are on view, and the CONTINENTAL MOTOR COMPANY show the "Rom" non-skid, in which a toughened compressed rubber tread is provided with short rubber bars in place of studs. These are so disposed as to provide a preventive of side slip.

An improved motor-car wheel, known as the "Victor," with a detachable flange to facilitate the changing of covers or inner tubes, is exhibited for the first time by SHEPPARD'S PATENT MOTOR WHEEL COMPANY, of Bridgend, Glam. The removable flange is of brass, and two small handles or bolts are provided, which, when screwed into the flange, automatically unlock it from the wheel. A turn of about two inches permits the flange to come off and the cover to be removed. The reversion of the process enables the device to be securely locked when the tyre has been replaced. It is claimed that the device is absolutely watertight, while it is impossible to rust.

The PREMIER ACCUMULATOR CO., LTD., of Northampton, exhibit their magnetos and sparking plugs. In the former some interesting improvements have been introduced with a view to the simplicity as well as the reliability of the device. The make and break arrangement is now operated by a steel ball working in an oil bath on a steel cam, and can be easily detached in one piece for examination when necessary. The armature is wholly enclosed, and the case enclosing it is entirely in one piece.

Messrs. DRUMMOND BROS., LTD., have a new radial drilling machine for motor garage and repair work, as well as other machine tools; and the E. M. BOWDEN'S PATENTS SYNDICATE, LTD., demonstrate their system of transmitting power through a flexible medium.

AUTOMOBILE ACCIDENTS.

THE inquest relative to the death of Mrs. Le Neve Foster, of Wilmslow, who was killed by a train overturning her motor-car at a level crossing, has been concluded at Northwich. The chauffeur admitted that he saw the flagman waving the red flag, but he mistook the significance of his action. He had no knowledge that there was a level crossing at the spot; he thought the man was guiding him past a part of the road which was being repaired. The jury returned a verdict of "Accidental death," and in a rider expressed the view that the railway company should erect a signal-box and place swing gates across the highway at the point where the accident occurred.

ON Saturday the Southwark coroner held an enquiry into the death of a man who had been knocked down by a skidding motor-bus while working in the Walworth Road. Evidence showed that the vehicle was going at a steady pace and the driver was prompt in pulling up. The jury returned a verdict of "Accidental death through the skidding of a motor-omnibus," adding a rider that there was not sufficient evidence to show whether a defect in the road between the tramlines was the cause of the skidding.

ON Tuesday an inquest was held at Seabrooke (Kent), on the body of Mrs. Heridge, who was knocked down by a motor-car and killed instantaneously. The jury returned a verdict of "Accidental death," exonerating the driver of the vehicle from all blame.

WHILE a motor-car was being driven along the highway near Coventry, on Tuesday afternoon, it swerved, ran up a bank and overturned. Mr. T. H. Abbott, of Newport, Isle of Wight, was killed, and a Coventry man named Peggy was badly injured.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

"JUSTICE" FOR MOTORISTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following particulars might be of interest to the readers of your valued journal as illustrating the sort of "justice" meted out to motorists by the Seabrook (Kent) Bench of magistrates.

Motoring on the main road between Canterbury and Folkestone, I was timed to have covered a measured distance of three furlongs at the alleged rate of twenty-six miles per hour. I was not, however, summoned for exceeding the limit, but for driving at a dangerous speed, although there was nothing on the road at the time except a motor in front, which was timed with mine, and there are no houses at all on this part of the road, which for certainly three-quarters of the distance is quite straight. As a result I was fined and my licence was asked for for endorsement, but it was not produced owing to my not having it with me at the time. Having regard to the circumstances and certain proved inaccuracies in the evidence, I was strongly advised to appeal against the decision and notice of appeal was accordingly given. Naturally thinking that the endorsement of my licence would depend upon the decision of the appeal, and receiving no further communication in respect of it, imagine my surprise on receiving a summons two days before the appeal was to be heard, to appear at Seabrook, two days after the appeal, for failing to produce my licence for endorsement. Upon hearing the appeal at Canterbury Sessions it was dismissed, several of the Seabrook magistrates being on the Bench during the sitting. In attending the summons for non-production of licence my solicitor explained why the licence had not been sent and asked that under the circumstances the case should be dismissed on my paying the costs. The magistrates, however, imposed a fine of £10 and suspended my licence for three months.

For a technical offence of the sort, due entirely to a misapprehension, this appears to be a most arbitrary and harsh sentence. It seems particularly vindictive inasmuch as an appeal against it could only be made to the Quarter Sessions, which will not be held until January next, by which time the period of suspension will have almost expired. Perhaps I ought to be thankful that there was not power to the Bench to order my incarceration, or possibly I should have had this experience included in my apportionment of "justices' justice."—Yours truly,

THE VICTIM.

THE KNIGHT ENGINE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with much interest all the literature I have been able to obtain with reference to the Knight engine, and most of the letters in connection with the same, and arising from this I should like to make the following remarks:—The only real advantage with this engine seems to be the absence of noise from its valve gear, for the other points claimed, viz., flexibility, quick acceleration, slowing down and picking up rapidly on a hill, amount to nothing, as these are only a matter of a good carburettor, a well-designed combustion chamber and gearing. Is the very slight noise made by mushroom valves worse than the hissing of the air when entering the carburettor, on many of the best makes, or anything like as bad as a pair of noisy chains? Therefore, is it not taking a big risk in substituting this new valve gear for an old, well-tried, and completely satisfactory method, for the sake of such a small decrease in the general noise? If this engine is all Mr. Knight claims it to be, why was it not entered in the 2,000-miles trial this year, as it is acknowledged that these cars were tested before that date? A good performance in that event would have effectively silenced some of the critics.

With regard to Mr. Knight's wholesale condemnation of the mushroom valve and the extravagant language with which he does it, one would think they really were bad. But, considering they have been used with the very greatest success ever since the petrol motor was invented, it is self-evident there cannot be much the matter with them. I quite admit that there are bad mushroom valves, but this is only because they are badly made or else of the wrong material. I have been to the trouble of asking 350 owners of Vauxhall cars if they have ever experienced any trouble with their valves. The following are the questions asked:—

Have you ever experienced any broken valves on your car?

If so, how many? After what length of time and what number of miles running approximately?

And can you assign any cause for the breakage or breakages?

Also number of miles car has run up to the present, approximately?

To these questions I have received 157 replies to date, giving a total mileage of over 1,265,700. And of these 157 owners only two have experienced a broken valve, both of which cases occurred after running about 3,000 miles on 5-h.p. cars, the earliest type of car built by my company, and the design of which valves was admittedly wrong. I am quite sure that other manufacturers could give equally good figures.—Yours truly,

VAUXHALL MOTORS, LTD.

L. Walton, Managing Director.

BALANCING A MOTOR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like your advice as to the best method of balancing engine of my car. It is a two-cylinder Buchet of 10-12-h.p., 4 in. by 4½ in. stroke, which was purchased new to replace a 6-h.p. single-cylinder motor. The crank-shaft is made up of two heavy discs, with crank pin, which both pistons work on. The complaint is excessive vibration when running. I have tried, I think, all methods of balancing the flywheel by lightening and loading rim, but fail to get it anything like steady, compared with other cars. The flywheel is 12 in. diameter and about 56 lbs. weight. Would a larger diameter flywheel, say 16 in. and about same weight, be any better?—Yours truly,

BALANCING.

[We doubt if "Balancing" will obtain any better result by increasing the diameter of the flywheel. The only method is to add a counter-weight thereto at a point opposite the crank pin. The engine should run steadily if balanced properly.]

THREE-CYLINDER ENGINES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would be interesting to know the reason why the three-cylinder engine, which a few years ago bid fair to become popular, has now practically disappeared from the motor world. While three vertical cylinders are the smallest number which give a perfect rotating balance, one drawback of the combination is the presence of an unbalanced couple in the fore and aft vertical plane. With the light pistons which are now made it is possible that the vibration to which

A Clement-Talbot Car "bogged" in New Zealand.

The illustration is reproduced from a post-card sent by a motorist in Christchurch. It gives a vivid impression of the difficult ground to be negotiated in the Antipodes.

this gave rise would not now be so serious. Another feature of this type of engine which very probably worked against its popularity is that of ignition. When one cylinder of a three-cylinder engine "misses" the effect is very disagreeable, but the great improvements that have been made in ignition devices during the last few years have rendered this objection much less serious than it formerly was.—Yours truly,

ENGINEER.

HILLS AND THEIR GRADIENTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with much interest your most valuable paper; I also see that "A Constant Reader" would like to know the gradient of Wiveliscombe Hill. The gradient is 1 in 16. This is not the worst hill in the district; there is a much steeper one between Dulverton and Extown, going towards Lynmouth over Exmoor. I am a native of Barnstaple, and know all the hills "Constant Reader" speaks of. I think he will agree with me that Bridge Street, Bideford, is much worse than Wiveliscombe.—Yours truly,

R. L. H.

MR. J. T. PRESTON, Witheycombe, Earlsdon, Coventry, the chairman of the Coventry Commercial Travellers' Association, asks for votes for the Commercial Travellers' School at Pinner for the daughter of the late Mr. F. W. Edmonds, of Coventry, who was for long known in the Midland motor and allied trades.

IN motoring from Strood to Lewes, on Saturday afternoon, via Tonbridge, Tunbridge Wells, Crowborough, and Wakefield, Mr. Albert Batchelor, The Limes, Frindsbury, Rochester, lost his 880 by 120 Stepney wheel fitted with square tread tyre. In the event of it having been discovered he would like to hear from the finder.

CLUBS AND ASSOCIATIONS.

ROYAL.

LORD ANNALY and Commander W. M. Ellerton, R.N., have been elected to membership of the R.A.C., as has also Count d'Oliveira et de la Penha Longa, of the Portuguese A.C.

The South Wales and Monmouthshire A.C. have decided to become associated with the R.A.C.

THE MOTOR UNION.

THE fourth annual dinner of the Motor Union was held in the Wharncliffe Rooms of the Hotel Great Central, Marylebone, N.W., on Wednesday last week. Mr. W. Joynson-Hicks, M.P., the chairman, presided over a representative gathering, which included Sir Martin Conway, Earl Russell, Sir Clifton Robinson, Mr. T. McKinnon Wood, M.P., Mr. W. R. Adkins, M.P., Mr. J. S. Ainsworth, M.P., Mr. R. A. Robinson (chairman of the London County Council), Hon. G. S. Montagu, Rear-Admiral H. M. T. Tudor, Mr. Ballin-Hinde, Mr. C. Cordingley, Mr. and Mrs. T. W. Staples Firth, and Mr. G. L. Gomme (clerk of the London County Council).

After the usual loyal toasts Mr. T. McKinnon Wood, the Under-Secretary of State for Foreign Affairs, proposed "The Motor Union of Great Britain and Ireland," and in the course of a somewhat humorous speech remarked that during the autumn holidays, when the daily papers were not too well supplied with news, they were chiefly occupied with the class to which those present belonged. The general idea seemed to be that motorists were a sort of bloodthirsty Bashi-Bazouks, and he almost thought that one's duty compelled him to sell his motor-car and travel in a four-wheeled cab. But he had not yet reached the heroic resolution of

The Humber Motor-Cab.

The above illustration depicts the Humber cab, which, since its introduction, has quickly become popular, especially among those who desire to make long runs from London. The reason for this lies in the fact that the vehicle, being fitted with a 12-h.p. four-cylinder engine, is not only very smooth running, but, being a good hill-climber, is able to maintain a good average speed. The chassis, which is provided with an exceedingly comfortable body, is well adapted for town work by both private and professional owners.

disposing of his motor-car. The motto of the Motor Union was considerate driving, and therefore he thought that he might appear there and wish them good luck. He personally had never been convicted, like some of his friends, or fined like others; but he had been run into, and that by a covered cart. He thought the motto "considerate driving" would be useful to other people besides motorists. As regarded the dust nuisance, motorists would probably prove to be blessings in disguise; they would lead to improved roadmaking in this country.

Mr. Joynson-Hicks, in replying, said that, although during the past year they had severed their connection with the R.A.C., they wished that club every success. They also wished success to all country clubs which thought it best to throw in their lot with the R.A.C. rather than with the Union, and they did not intend to take any steps to make any club join the Union. As regarded motorists and the public, he thought the former were in for a considerable amount of trouble during the next year or two. He objected in the strongest manner to all motorists being tarred with the blackest of brushes because there were a few inconsiderate drivers. He also objected to the idea that motorists generally were to be held responsible for the improvement of the manners of the inconsiderate drivers. It might just as well be said that the riders and drivers of other vehicles ought to be held responsible for the black sheep in covered vans. There was a law for inconsiderate drivers, and the Motor Union was desirous that the law should be obeyed. He thought the police would be better employed in seeing that the law was observed than in setting traps for motorists on Salisbury Plain or other places where a little speed was not dangerous. Motoring had lived through

the period of ridicule, and was now in the period of hostility, which was nowhere more apparent than in the House of Commons. It had recently been decided by the motoring associations that there should be no more road-racing in this country, and he was exceedingly glad of it. The roads were not established for that purpose, and no motorist had any right to indulge in racing on any part of the King's highway. The future was with the motor, and the time had arrived when they might demand the same justice as was accorded to the driver of the covered an.

"The Motor Movement" was proposed by Sir Martin Conway and replied to by Mr. R. A. Robinson, the chairman of the London County Council, who said that the congestion of London traffic was rapidly increasing, and the problem before those who were responsible for public affairs was a great one. The appointment of a strong advisory committee to deal with traffic matters had been recommended. The London County Council, however, did not want any one forcing it to make roads or spend money unless it considered such action was necessary. Other people thought that the Council itself ought to be the managing body, but that he feared could not be so. The Prime Minister had consented to receive a small deputation on the subject of the traffic problem in a few days' time, and they were going to ask what, in the opinion of the Government, was the best remedy. The matter must not be left to drift, as the condition of the streets was becoming dangerous. Mr. W. R. Adkins, M.P., and Mr. E. Manville, president of the Society of Motor Manufacturers and Traders, also responded to the toast.

MR. W. JOYNSON-HICKS, M.P., presided at the monthly meeting of the Motor Union, held at the Hotel Great Central on the 18th inst. The receipts from January 1st to October 31st were reported as £12,197, as against £9,878 for the same period of last year. It was agreed to support two appeals in police and county court cases, and grants were made in three cases under the car and cycle badge rules. Additional members of committees were elected as follows:—Highways Protection Committee, Messrs. D. J. Barry and G. H. Bowden (Reigate); Signs and Notices, Mr. H. G. M. Conybeare, J.P. (Ingatstone); Engineering and Technical, Messrs. J. W. Coade (Brixton) and K. M. Munro (Kingston-on-Thames).

The Welsh A.C. submitted a three days' programme of entertainment for members of the Union attending the provincial meeting in South Wales next year. A discussion took place on the best way of dealing with the small minority of motorists who drive recklessly. A letter to the Home Secretary was considered, amended, and ordered to be sent.

BROOKLANDS.

AT Brooklands, F. Newton has attained a speed of 119.34 miles per hour, travelling over the flying half-mile in 15.083 sec. He was driving the 90-h.p. Napier Samson, and thus beat the 90-h.p. short distance record obtained on the 30th ult., when he covered the distance at the rate of 114.98 miles per hour.

DERBY.

AT their meeting on Tuesday the 1st prox. the members of the Derby and District Automobile Club will be asked to consider a resolution which has been arrived at unanimously by the committee.

This is to the following effect:—"That the Derby and District Automobile Club become associated with the Royal Automobile Club, provided that that body consents to withdraw the word "only" in Clause 18 of their scheme for association, thus allowing freedom of action to provincial clubs; but that, in the event of their refusal to adopt this suggestion, the Derby and District Automobile Club remain affiliated with the Motor Union."

Following the meeting a dinner will be held and a large attendance is expected.

ESSEX.

THE Essex County A.C. is supplying at cost price special warning triangles to owners of property having carriage drives abutting upon the main roads.

SHEFFIELD.

MR. E. F. COUPE will preside at the third annual dinner of the Sheffield and District A.C., to be held at the King's Head Hotel, Sheffield, on the 16th prox.

The club has recently opposed the application of the borough of Glossop for a ten mile speed limit, and is continuing its work of fixing caution boards at various cross roads in the area of its influence.

SCOTTISH.

THE Road Surveyors' Association of Scotland have accepted an invitation from the club to a conference between the club and the association, at which reports by the representatives of both bodies on the recent International Road Congress in Paris will be made, and will form a basis of discussion. The meeting is to be held in the Central Station Hotel, Glasgow, on the evening of Friday, the 11th prox., at 7.30 p.m.

TRANSVAAL.

OFFICIAL news is now to hand with regard to the events during the past year held by the Transvaal Automobile Club.

For the annual hill-climbing competition twenty-seven cars were entered and the special prize for the best all-round performance was won by Mr. D. H. Baker on his 12-14-h.p. Star car. Mr. Baker was also credited with the best performance in the "Reyersbach" Trophy Reliability Trial over a course of 194 miles.

The "Park" Trophy Reliability Trial was won by Mr. H. Gill on his 25-30-h.p. Austin car, and Mr. H. Hellman on his 40-h.p. Napier took the special cup for the fastest time, travelling the 166 miles of the route at the rate of 31.38 miles per hour—a record for the Transvaal A.C.

THE Society of Road Traction Engineers will meet next Monday to debate a motion by Mr. Kerr Thomas: "That the tubular system of radiator is the only satisfactory one for use upon commercial vehicles." Mr. Leo Harris will oppose.

THE committee of the Sussex Motor Yacht Club have secured as headquarters the premises formerly occupied by the Brighton County Club. The building, which was specially erected for a club, is conveniently situate in the centre of the town, within a few doors of the sea front, and affords excellent accommodation, including a large lofty hall on the ground floor, about 80 ft. by 30 ft., which will be very useful on the occasions of dinners, concerts and other social gatherings.

COMPANY NEWS.

In the case of New Companies the file number is given at the end of the particulars.

THE Vindec Motor Cycle Company, Ltd., has been registered with a capital of £20,000 and offices at 13-15, Wilson Street, Finsbury, E.C.

WITH a capital of £1,500 in £1 shares the firm of Pemsel and Wilson, Ltd., has been registered as a public liability company. The offices are in the London Road, Apsley End, Hemel Hempstead.

WITH a capital of £70,000 British Lyxhayr has been registered to acquire the British rights in an innovation for the treatment of a fibre which has been shown at some of the motor exhibitions in the past. (100,234).

A. DARRACQ AND CO. (1905).—The third annual ordinary general meeting of A. Darracq and Co. (1905) was held under the chairmanship of Mr. J. S. Smith-Winby, who moved the adoption of the report and accounts to September 30th last. For the sixth successive year he was able to make a satisfactory statement with regard to net profits. It was true they had not attained the very high level of the two previous years; but a net profit of £165,000, in a concern of such dimensions, was a very handsome amount. The turnover was largely increased by orders for motor-cabs for London, Paris, New York, and other places, and the sales of touring cars were good. There was, however, a falling-off in business during the last six months of the year. The company had been handicapped by the great reductions in prices constantly being made by manufacturers who found it necessary to realise on stock regardless as to whether they sold below cost price, as many of them must have been doing for some time past. The resources of the company were in a more liquid state than at this time last year, and they might claim their financial position was correspondingly strong. He moved the declaration of a dividend of 2s. per share on the ordinary shares, making a total of 20 per cent. for the year (the same rate as last year), and that the balance of £35,437 be carried forward. This was £8,000 more than the amount brought in. Mr. E. F. Kelly seconded, and the resolution was adopted.

DAIMLER MOTOR.—The directors report that the trading for 1908 has been of an unsatisfactory nature. This loss has been partially incurred by a decreased turnover, owing to the indifferent state of the market, and to the change (due to the adoption of the new engine, now well known to the public) which the board have been effecting for some considerable time past. The amount brought forward from last year was £49,395, from which directors' additional remuneration absorbed £3,105 and interim dividend paid on preference shares £2,089, leaving £44,200. Final dividend on preference shares then absorbed £3,174, leaving £42,026. From the net loss for the year, viz., £49,286, is to be deducted the above amount of £42,026, leaving a deficit of £7,260. Deducting this from the general reserve account of £180,000 will leave that account at £172,739.

AERONAUTICS.

MR. F. H. BUTLER informs us that the International Aeronautical Federation comprises the following clubs:—Aero Club of the United Kingdom, Aero Club of America, Wiener Aero Club, Aero Club de Belgique, Aero Club de France, Berliner Verein Fur Luftschiffahrt, Societa Aeronautica Italiana, Real Aero Club de Espana, Svenska Aeronautiska Sallskapet, Aero Club Suisse.

THE Aeroplane Club, of which Captain W. Windham is the hon. secretary, has issued a list of prizes which await successful aviators. In addition to about £37,000 offered for prizes for success in navigating the air, the Government of France will include a sum of £4,000 in its next Budget for the encouragement of aerial flight.

ROAD REPORTS.

LONDON.—It never seems to occur to the various engineers and surveyors of London, writes the driver of a horse-drawn vehicle, that an occasional layer of new ballast rolled well into the surface of the wood pavement would not only prevent vehicles from side slips, but would also add to the durability of the road surface.

HAYWARDS HEATH.—The Haywards Heath Council are apparently converted to the principle of tarred roads. It has been decided to tar the roads of the town next spring, and the Council are about to purchase their own tar-spreading machine.

BERKHAMSTED.—The Berkhamsted authorities, who had intended to apply to the County Council for an enquiry into a proposed speed limit for motor-cars, have now decided to postpone the matter until the spring of next year, and in the meantime confer with the County Council upon the subject.

CHESHIRE.—Mr. Burns has made the following reply to a question by Captain Faber as to the dust nuisance created by motor-cars. "It is the practice of the L.G.B. to sanction loans for laying down roads with tar macadam, and to allow a period of five years for the repayment of the loan. Assuming, therefore, that the view attributed to the Cheshire authorities is correct, it would seem that the local authorities could recoup themselves the additional initial expense within the period of the loan." The declaration of the Cheshire authorities referred to in the question was that tar macadam when once laid down on roads was one-fourth less costly than ordinary macadam to renovate.

LINCOLNSHIRE.—At Saxilby, near Lincoln, the only way for vehicular traffic to cross the river has hitherto been to ford it. As the river is rather wide and deep after rains it was had enough for horses, but often

A Bavarian Government Public Motor-Car Service.—A Snapshot between Berchtesgaden and Hintersee.

dangerous for automobiles. The width of the water was forty feet, and motorists who were aware of the conditions avoided this road as far as possible. A bridge has at length been built. This was completed this week and the road is now passable to motor-cars.

KENT.—Mr. Thomas Kettle, the Borough Surveyor of Lydd, reports that the main road from New Romney to Lydd is undergoing repairs, and for a few days cars should proceed from New Romney via Old Romney. The repairs to Castle Hill road, Dover, are nearing completion. Caution should be exercised when driving on this road, which is dangerous owing to its steep gradients and curves.

SPEED LIMIT APPLICATIONS.—Several roads are scheduled in applications for ten-mile limits made by the Middlesex and Hertford County Councils and West Ham Council. In the former case the roads are High Street and Kew Bridge Road in the Brentford Urban District, and the Uxbridge road within Southall-Norwood Urban District. In Hertfordshire the application relates to the St. Albans, Hatfield, and Barnet roads, besides several in Elstree. West Ham Council seeks a similar restriction for a number of roads.

"POLICE CONTROLS."

THE police have been timing motorists on the familiar traps around Cambridge; and also near Grantham, on the Great North Road.

THE police trap in Clifton Drive, Lytham, has lately been in daily operation.

IN the parish of Long Bennington, near Grantham, motorists are being timed over a measured distance every week end.

FORTHCOMING EVENTS.

NOVEMBER.

28th (Sat.).—Opening of the Paris Motor Car Exhibition.
30th (M.).—Speed limit inquiry at High Wycombe.

DECEMBER.

2nd (W.).—Lecture by Mr. E. Stuart Bruce, M.A., before the Society of Arts, on "Mechanical Flight."
10th (Th.).—Annual Dinner of the Aero Club of the United Kingdom at the Hotel Ritz, London.
10th.—Ladies' A.C. lecture by Mr. C. Y. Knight on "The Valveless Engine."
11th.—Scottish A.C. Conference with Road Surveyors' Association of Scotland.
13th (Sun.).—Closing day of the Paris Salon.
23rd (W.).—Speed and reliability trials at Nagpur, Central Provinces.

JANUARY, 1909.

14th (Th.).—Annual Dinner of clubs associated with the R.A.C. at the Hotel Cecil, London.
22nd-30th.—Scottish Motor Exhibition at the Waverley Market, Edinburgh.
26th.—Scottish Motor Trade Association Dinner at Edinburgh.

FEBRUARY.

War Office Fourteen-days' Trial for Light Tractors.

LIGHTING-UP TIMES—LONDON.

Nov. 28th—4.51 ... 30th—4.49 ... Dec. 2nd—4.47 ... 4th—4.45
" 29th—4.50 ... Dec. 1st—4.48 ... 3rd—4.46 ... 5th—4.44

To find the approximate lighting-up time for Birmingham 4 minutes should be added to the above times, and 1 for Manchester. For Glasgow 3 minutes should be subtracted, and a deduction of 6 minutes from the above times should be made for York.

CASES AGAINST MOTORISTS.

COMMITTAL.

Mr. J. H. Pearson has been committed by the Bow Street (London) magistrate to the Central Criminal Court for trial on a charge of manslaughter; the circumstances of the case have been already reported in our columns.

WARRANT ISSUED.

A warrant has been issued by the Bakewell Bench for the apprehension of a motorist who failed to answer summonses for driving a tri-car with no light attached and for failing to produce his licence.

BATCHES.

Several cases against drivers of motor-cars have lately been heard at the courts at Newbury (4), Grantham (several drivers fined sums ranging from £2 to £5), Cambridge (3), Lytham (2), Guildford (9), Ramsgate (6).

MOTOR-BUSES AND LAMP-POSTS.

IN the Divisional Court of the High Court the decision of the Wandsworth County Court judge in the case of "The Barnes Urban District Council v. the London General Omnibus Company" was reversed, and the company is thus rendered liable for knocking down several lamp-posts in the streets. It was shown that the motor-buses had been driven within four inches of the kerb, although their bodies projected considerably beyond their wheels. The onus, according to the court, lay with the company to show that the drivers used reasonable care.

PUBLIC SERVICE.

THE motor-buses between Stranraer and Drummore, which were put in service about a year ago by the railway company, are about to be withdrawn, the enterprise having been a somewhat serious loss.

OWING to the increase in their business the Crypto Electrical Company have installed a second telephone, the number of which is 12831 Central, at their premises at 155 and 157, Bermondsey Street, London, S.E.

THE difficulty of cleaning the painted work of motor-cars can be materially lessened by the use of "Lickoleum," a new liquid soap for the introduction of which to motorists Messrs. R. D. Stewart, 61, Mansell Street, Aldgate, London, E. (who are also associated with Handoline), are responsible.

THE Palmer Tyre Company, 119, Shaftesbury Avenue, London, W.C., have issued a new circular in advocacy of the use of tyres of a large diameter.

BUSINESS NEWS.

IN the reliability trials of industrial motor vehicles, lately held by the Austrian Motor Club, the Coventry 10-12-h.p. Humber van was awarded a diploma for reliability, while in the brake trial the vehicle showed the best result.

WE understand that Mr. L. B. Rawlence and Messrs. W. Watson and Company, of Liverpool, have purchased the goodwill of J. E. Hutton, Ltd., and have acquired the sale concession for Berliet cars for the United Kingdom. The firm, which will be known as Berliet Motors, will have its headquarters from the 1st prox. at Piccadilly House, Sackville Street, London, W.

IN connection with the Paris Salon, which is being held from the 28th inst. to December 13th, and from December 24th to 30th, the London, Brighton, and South Coast Railway are issuing special 14-day excursion tickets from London to Paris, via Newhaven and Dieppe, on Fridays, November 27th and December 4th, 11th, 18th, and 25th, and Saturdays, November 28th and December 5th, 12th, 19th, and 26th. Special "Sunday in Paris" tickets will also be issued on Saturdays, November 28th, and December 5th, 12th, and 26th.

WITH their usual enterprise, Messrs. Easton and Melville, Ltd., of Illo lubricant fame, chartered a steam motor-bus which ran daily, during Show week, between their place of business in Shaftesbury Avenue, W.C., and Olympia. The vehicle was placed at the disposal of their customers and created quite a furore as it proceeded through the West End, a leather-lunged bugler assisting to draw attention to the notices regarding Illo which were plentifully sprinkled about the bus.

PUBLIC service examinations are to be instituted by the M.U. and Captain L. A. Kingston and Mr. R. W. A. Brewer are drafting a specimen set of questions for use in connection therewith.

AN excellent type of electric vulcanizer has been brought out by Messrs. Richard Gornall and Sons, of Pilling, Garstang, Lancashire, who will be able to satisfy inquiries as to its economical consumption of current.

THE entrance fee for examinations for the R.A.C. driving certificate has been reduced from 10s. to 5s., and the *viva voce* questions on mechanism are to be discontinued, so far as the driving certificate, as distinguished from the certificate for mechanical proficiency, is concerned.

AT the dinner of Messrs. A. Darracq and Co. (1905), Ltd., last week at the Trocadero Restaurant, London, many of the leading agents attended. Mr. Alfred Rawlinson presided, and spoke of the value of racing in the perfection of motor design. He referred to the successful handling of the Darracq car in the Scottish Trial by Mr. H. Kennedy, and presented that gentleman with a souvenir of the event.

ACCORDING to a recent return there were 3,267 motor-cars and 4,002 motor-cycles in use in Belgium at the commencement of 1907, the cars showing an increase of 311, and motor-cycles a decrease of 293 on the year.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. X.]

LONDON, SATURDAY, DECEMBER 5, 1908.

[No. 509.
